## PREFACE

R. Baine Harris

One of the best ways to begin a study of Neoplatonism is through a study of its aesthetics. In fact, one of its most serious Twentieth Century students, William Ralph Inge, once referred to the whole system of Plotinus as a "Grandiose Aesthetic." He did so, I think, because Neoplatonism is based upon valuation. It is a philosophy that proposes to evaluate and rank reality in terms of what it judges to be the highest reality. Valuation is necessarily based upon experience, as indeed, is the whole of aesthetics. Whether or not Dean Inge's label can apply depends upon what is to be seen as the legitimate scope of aesthetics. If aesthetic experience is seen as limited only to our sensuous experiences as understood by our intellect, it would not. But if it is extended to include our experience of purely rational concepts, such logical concepts as principles, laws, and numbers, and extended even further to include direct experience of the divine, it would. Plotinus certainly appealed to a wide range of human experience, sensuous, rational, and religious as the basis of his ontology, as did most of his admirers in later centuries. A multi-leveled scheme of valuation is the basis of his ontology; and his ontology figures into almost every other subject he treats, and especially so in his psychology, theology, and aesthetics. An understanding of his aesthetics and the way he establishes it will aid in understanding other elements of his philosophy and the way he establishes them.

Neoplatonism is based upon an axiomatic presupposition that the world that we experience through our senses is not the real world. Behind it lies something that is more real than it is, which, in turn, is based upon something that is still even more real than it, so that the Most Real is quite removed from what we ordinarily experience. It is a theme found in ancient Greek philosophy and in numerous Hindu writers throughout the centuries. It is only a pre-

supposition and not a scientific fact. It is a hypothesis and a point of faith, since its verification is beyond that which can be scientifically ascertained. It is a presupposition that many people would like to believe, and some find they are able to do so, and some find that they are not. In any case, it is a theme of great historical importance in the intellectual history of the West, and India, and one that is not inconsistent with, and is even relatively amenable to, the major theologies of the Greeks, Indians, Hebrews, Romans, Christians and Muslims. One mode of demonstration of this point is to be found in the religious artifacts of these major cultural traditions. A study of the religious art of the West, for example, could hardly be done without some understanding of the basic themes of Neoplatonism as they were interpreted in various centuries, and the same would apply to religious art in other venues.

One distinctive feature of the Neoplatonic interpretation of this theme is a mapping or ranking of reality into a series of levels of reality so that anything at any given lower level is only relatively real. It can be concretely real as an individual thing while also being real as a lower level of something of a higher level. According to Plotinus, for example, man is most apparently real as a body, but he is also real as a soul, and as some element of the divine.

Another distinctive feature of Neoplatonism is that in contrast to many themes in the major theologies of the West is that it is mystical without being other-worldly. Plotinus was quite concerned to combat other-worldliness and once said "All things there are here," which I interpret to mean there is no "there" except "here." He was concerned with the same world that Aristotle was concerned with, the same individual real, but he saw different levels of reality in any given individual. His mysticism results from the mystery we encounter when we consider the various sorts of reality inherent in any concrete individual, and in his case, in particular, the various levels of reality inherent in it. This point is especially important in considering the history of religious art in the West, a notable instance being the artifacts influenced by Renaissance Neoplatonism, a specific case being the works of Michelangelo.

The essays in this book are not specifically intended to present a comprehensive picture of Neoplatonic aesthetics, but rather to show how elements of the aesthetic views of Plotinus and later Neoplatonists have had a role to play in the history of Western Art. Certain papers do focus on certain themes in the aesthetics of Plotinus and some later Neoplatonists, while others deal mainly with the appearance and reappearance of those themes in the writings and artifacts of later philosophers and artists throughout the centuries. Again, they are not presented as a comprehensive treatment of the subject but rather as typical

significant examples to illustrate the way in which Neoplatonic aesthetic teachings continued to be influential in various venues in various centuries, including even our own time.

All of the papers in this volume were first presented in an earlier form in an international conference of the International Society for Neoplatonic Studies held in Rethymnon, Crete in the summer of 1998 under the sponsorship of the University of Crete. The idea for the conference was conceived by Professor Aphrodite Alexandrakis of Barry University in Miami, who also arranged for its funding and served as its able conference director. She also served as the editor of this volume and was assisted in this function by Professor Nikolas J. Moutafakis of Cleveland State University in Cleveland, Ohio. Altogether they present a well-balanced scholarly brief introduction both to Neoplatonic aesthetics and to its significance in Western Art.

## Editors' Introduction

It is interesting to note how Greek philosophy achieved one of its most lasting impressions through Neoplatonism. From modest adaptations by the early fathers of the Church, to the bolder christianization of aspects of the Neoplatonic system by Saint Augustine and Dionysius the Areopagite, as well as by later efforts, one encounters the seeds of Neoplatonism blossoming again and again throughout the long history of Western thought. One needs only cite the works of Scotus Erigena, Hugo and Richard of St. Victor, Eckhart, Böhm and Bruno to appreciate the far reaching influence of this tradition. Even as late as the nineteenth century Friedrich Schelling sought to infuse Neoplatonism with Intuitionism, precipitating new insights into the philosophy of history, which in turn became a prelude to Hegel's philosophy of mind.

Not only are the origins of Neoplatonism significantly diverse, involving a wide array of thinkers as its founders, *e.g.* Plotinus, Iamblichus, Longinus, etc. to mention a few, but the scope of its influence has penetrated deeply into a broad ranging field of philosophical inquiry, encompassing issues familiar in areas relating to the formal study of metaphysics and epistemology, as well as in lesser known areas concerning the nature of art, the contemplation of the beautiful, the essence and function of artistic objects, the knowing of nature as an aesthetic experience, etc. It was felt by several members of the Society that attention should be directed finally to the latter and relatively uncharted territory. Thus, as a means of exploring the scholarly community's most recent understanding of how key Neoplatonic concepts play a seminal role in aesthetics, the International Society for Neoplatonic Studies and the University of Crete cosponsored the 1998 International Conference on the theme of "Neoplatonism and Western Aesthetics" in Rethymnon, Crete.

Apart from the superbly beautiful surroundings of the island's natural setting and the gracious accommodations and support provided for the conference participants by his Grace Anthimos, Metropolitan of Rethymnon and Avlopotamos, Mr. Dimitris Archondakis, Major of Rethymnon, the Vice Rector Dr. Christos Nicolaou and Dean Dr. Alexis Politis of the University of Crete, the Hellenic Ministry of Culture, the GrecoTel company and the hospitality of the people of Crete, the conference was uniquely endowed with a fine collection of papers pertaining to its central theme. What follows is an arrangement of these contributions under four broad headings.

In the first grouping: "Neoplatonism and the Concept of the Beautiful," the theme of each contributor centers about the concept of "the beautiful" itself, as it is addressed in the works of various Neoplatonists from Plotinus to Proclus, and how in some instances this theme plays a central role for later Christian writers.

In "Neoplatonism and the Image in Visual Art," the emphasis shifts to how historically the Neoplatonic concept of beauty is investigated and utilized by certain renowned artists and architects, "concretizing," so to speak, the Neoplatonic concept of beauty in space and time.

The third grouping, "Neoplatonism in Contemporary Aesthetics," contains papers focused specifically upon the influence of Neoplatonism in contemporary discussions involving the creative process and the aesthetic experience generally. Here the tradition of Neoplatonism is found to be underlying the thinking of such seminal twentieth century figures as Kazantzakis, Heidegger, and Santayana.

Finally, in "Neoplatonism and Cosmic Genesis" the theme centers on how the concept of the beautiful plays a central role in discussions involving processes governing the generation of the world in Plotinus' works. It is the sincere hope of the International Society for Neoplatonic Studies that these contributions will achieve their major objective, which is to stimulate further research and study in the area of Neoplatonism and the study of aesthetics.

The editors also wish to express their gratitude to Jonathan Raymon for the wonderful job he did in preparing the camera-ready manuscript for publication.

## Action, Contemplation and Interiority in the Thinking of Beauty in Plotinus<sup>1</sup>

Jean-Marc Narbonne

### Beauty as a state of affairs

The thinking of Beauty in Plotinus is intimately related to his philosophy, primarily because the very undertaking of a spiritual elevation is at the same time, for Plotinus, an aesthetic undertaking, an experience of beauty experienced in itself; and, moreover, even prior to the slightest will toward a higher reality, our very experience of the world is already, for Plotinus, an experience of beauty.

Let us begin with the second point, that of our very own experience of the world which is declared as fundamentally an experience of beauty. This latter declaration might seem striking once we remind ourselves of Porphyry's opening statement in his *Life of Plotinus*, relating that his master "seemed ashamed of being in the body,"<sup>2</sup> and also, once we acknowledge that Plotinus is the philosopher of the *aphaeresis* par excellence, professing the retrenchment and detachment from all that is sensible. Shame of one's body and will to detach oneself from the sensible does indeed presuppose a certain disavowal of the world and of its beauty.

We must immediately reply that nothing is more alien to Plotinus than the condemnation of the world for its lack of beauty. On the contrary, as Plotinus points out, we do not see, by reflecting, just how such diversity which is our world, could have been as artfully arranged as it is indeed in reality: "if anyone could plan rationally as well as possible, he would wonder at it because plan-

ning could not have found out another way to make it" (III, 2, 14, 2-4). And again:

Will anyone be so sluggish in mind and so immovable that, when he sees all the beauties in the world of sense, all its good proportion and the mighty excellence of its order, and the splendour of form which is manifested in the stars, for all their remoteness he will not thereupon think, seized with reverence, "what wonders, and from what a source?" (II, 2, 16, 51-55)

We are, then, from the start, according to Plotinus, in beauty and are attracted by it. The proof, *a contrario*, is that the ugly is unendurable for us, our soul "when it encounters [it] shrinks back and rejects it and turns away from it and is out of tune and alienated from it" (I, 6, 2, 5-6); cf. *Symposium*, 206 d). But what is ugliness for Plotinus? It is the absence of form in that which is destined to receive one. The ugly, then, is the unformed with which the soul has no affinity, in front of which it can receive no guidance, that which presents itself as the undetermined and unattainable. And it is not just that the soul judges ugly that which is in a state of indistinctness, but it is also that the soul cannot endure the spectacle as if it was facing nothingness, emptiness, an abyss devoid of the least trace of intelligibility from which it must protect itself (cf. II, 4, 10). This peculiar effect that the ugly has on us is described by Plotinus as "an impression of the shapeless" (typon tou amorphou II, 4, 10, 23).

On the other hand, the beautiful is obviously that which, first of all, is the bearer of form, shape and just proportions, in other words, that which the world profusely displays and that to which our soul is naturally directed. How can this natural attraction be explained? What is it, in harmony, that attracts us? Plotinus' explanation is straightforward and precise: there is a kinship between the soul and the beautiful, or more precisely, an original belonging to one another:

Our explanation of this is that the soul, since it is by nature what it is and is related to the higher kind of reality in the realm of being, when it sees something akin to it or a trace of its kindred reality, is delighted and thrilled and returns to itself and remembers itself and its own possessions. (I, 6, 2, 7-11)

Beauty in the lower world is, then, a trace of a higher beauty. Manifestly beautiful in itself, without a doubt, but as a trace, it bears witness to its superior, its archetype and its source.

We might ask though, why insist on the reference to a higher reality on seeing sensible beauty as a trace of something else, and not be content with sensible beauty as such, beauty as it presents itself in the here and now? It is because, for Plotinus, the aforementioned affinity between the soul and beauty is explainable only by a common origin shared by these two realities, and not by haphazard chance. The universal nature of man's search for beauty and his astonishment before it could not possibly be explained without admitting that such an attraction was prepared beforehand; such a communion is too profound, too intimately felt to be the fruits of fortuitous links and accident; hence, such a communion is only understood by assuming a mysterious belonging, a pre-existent belonging, since it is not immediately given in the diversity of our sense experience. Beauty simultaneously appeases and astounds the soul, since the soul recognises in the trace of truth, of purity, of a unifying principle, to which the soul senses its belonging and to which it aspires. Indeed, our pleasure experienced through the intermediary of art results entirely from the impact of such a discovery.

The soul is delighted in beauty because through the recognition of the imprint of that in which it participates and finds the source of its being, it comes to recognise itself. In noticing the form which unifies and structures the diverse parts of a certain work; in perceiving the concept shaping otherwise insignificant matter, the soul discovers in nature or in the artifact the cohesive force of the Idea, the organising principle which communicates symmetry, measure, and beauty to the object. And in its own self-recognition it is lightened, because it now can aspire to its own inner harmony and seek to re-ascend to that principle inside itself which regulates, unifies and appeases. Is it not precisely the soul which is unstable and intemperate, whimsically oscillating between every inclination, drawn in every direction, which, in mood and in deed, is incapable of constancy, unity or harmony, which we qualify as ugly? And is it not because of a work's firm unity and basis that we qualify it as beautiful?

### Beauty as above symmetry

Let us immediately dispose of a first possible misunderstanding in the comprehension of Plotinus' stance on the question of Beauty.

For the latter, the beautiful can in no way be reduced to the symmetry of parts because this might lead to the erroneous conclusion that only the com-

posite can be beautiful and that whatever is simple, like the sun or a unique sound, is devoid of beauty, when in fact the parts of a composite are not always beautiful. Moreover, "though the same good proportion is there all the time, the same face sometimes appears beautiful and sometimes does not, surely we must say that being beautiful is something else over and above good proportion, and good proportion is beautiful because of something else?" (I, 6, 1, 37-40).<sup>3</sup> Who would dare profess—unless one desired to eradicate the ethical dimension in the consideration of Beauty—that a funeral procession, no matter how symmetrical and justly proportioned it presented itself to be, evokes beauty? Symmetry of the parts in sensible objects, then, is the bearer of beauty only when it manifests the marvel of the Idea. The object, then, is beautiful only as the epiphany of the Idea, the latter being what is first called beautiful, since it is itself responsible for irradiating the object with beauty and ultimately communicating symmetry and just proportion to it. "It is as if it was in the presence of a face which is certainly beautiful, but cannot catch the eye because it has no grace playing upon its beauty" (VI, 7, 22, 22 ss.). This applies, as much to artistic productions as it does to natural productions: it is the "inner form" (*endon eidos*, I, 6, 3, 8) of the artist, or of the architect (I, 6, 3, 6 ss.) which is beautiful even before the material manifestation, which is beautiful only insofar as it lends itself to the original idea. Hence, we can understand Plotinus saying that art in itself, or preferably, the artistic process itself, is superior to its product:

If art makes its work like what it is and has—and it makes it beautiful according to the forming principle of what it is making—it is itself more, and more truly, beautiful since it has the beauty of art which is greater and more beautiful than anything in the external object. (V, 8, 1, 22-25)

It might well be beautiful and harmonious, but a work cannot abandon its status as trace: "well, then, are the things made and the forming principle in matter beautiful, but the forming principle which is not in matter but in the maker, the first immaterial one, is that not beauty?" (V, 8, 2, 16-19).

#### Beauty as above imitation

There is a second misunderstanding that must be avoided when interpreting the aesthetics of Plotinus: since the value of the artistic production de-

pends on the value of the inner concept (*endon eidos*) in the artist, it goes without saying that, for Plotinus, who on this point drops the platonic interpretative framework,<sup>4</sup> artistic production could vie with and perhaps sometimes supersede nature's own productions:

But if anyone despises the arts because they produce their works by imitating nature, we must tell him, first, that natural things are imitations too. Then he must know that the arts do not simply imitate what they see, but they run back up to the forming principles from which nature derives; then also that they do a great deal by themselves, and, since they possess beauty, they make up what is defective in things (V, 8, 1, 32-38).

In the same way, borrowing Plotinus' example, "Pheidias too did not make his Zeus from any model perceived by the senses, but understood what Zeus would look like if he wanted to make himself visible" (V, 8, 1, 32-40).<sup>5</sup>

If, then, symmetry in the sensible order is beautiful as an expression of the Idea working within nature and the artist, then, we can include as beautiful certain actions, occupations, ways of being, in so far as they can be referred to the Idea which engenders them. Consequently, a single term, a single concept, can be predicated of otherwise heterogeneous realities: a beautiful painting, a beautiful melody, a beautiful action, a beautiful sentiment, a beautiful virtue, a beautiful science, a beautiful soul. The following question which Plotinus had asked himself is thus answered: "how does the bodily agree with that which is before body?" (I, 6, 3, 5-6); there is agreement because both participate in the Idea (2, 13). From here the aesthetic ascendance, which is also an ethical and metaphysical one, can begin; as Plato taught,<sup>6</sup> from wordly beauty, the beauty of the work used as a "stepping stone" (I, 6, 1, 20), we may advance progressively toward the Idea of the Good in itself, which allows us to see the beauty of all beautiful things. But what an arduous task it is for us to learn to re-ascend the emotional path leading from the beauty of works of art and nature to the inner principle that gives them life! As Plotinus remarks, "but we, because we are not accustomed to see any of the things within and do not know them, pursue the external and do not know that it is that within, which moves us" (V, 8, 2, 32-34). We must waken the inner vision from its stupor, teach it to recognise the true bearer of beauty, that original reason "which is no longer in anything else but in itself" (V, 8, 3, 7-8).

### Beauty as contemplation

The soul, then, is naturally inclined towards Beauty, since both belong to each other. The clearest statement on this point is without a doubt V, 8 [31], 3, 1 ss.: "There is therefore in nature a rational forming principle which is the archetype of the beauty in body, and the rational principle in soul *is more beautiful* than that in nature, and it is also the source of that in nature. *It is the clearest in a nobly good soul* and is already advanced in beauty; for by adorning the soul and giving it light from a greater light which is primarily beauty [*scil.* the Intellect] it makes us deduce by its very presence in the soul what that before it is like, which is no longer in anything else but in itself."

When the soul wanders away from Beauty, when it can no longer recognise it, it is a sign of its straying into the distractions of the multiple. And by forgetting the true status of sensible beauties as *images, traces, shadows* (I, 6 [1] 8, 7), the soul confounds veritable beauty with its signs, like the man who wished to catch his "beautiful reflection playing on the water" (8,9). And when the soul is thus weakened by its submersion in the sensible diversity, it can no longer see the links existing between corporeal beauty, consisting in the exteriority of the parts, and incorporeal beauty, that, primarily, of the soul and of the sciences and virtues which relate to the virtue of the soul, that are, as Plotinus says, *katharseis*, "purifications" (I, 6 [1] 6, 2).

The fact that the beauty found in the soul predominates over that embedded in the sensible *lógos*, itself over the accomplished *érgon* which derives from it, is an implication of plotinian metaphysics, which holds that sensible reality is but a trace, a lower form of a higher activity which is one of thinking (*noêsis*), of contemplation (*theôria*) or of wisdom (V, 8 [31], 5, 1 ss.). Plotinus professes that all beings are in fact by-products (*parérgon*) of contemplation (III, 8 [30], 8, 26); or, as he expresses differently: "every life is a thought, but one life is dimmer than another" (*ibid.* 8, 17), and "all things come from contemplation and are contemplation, both the things which truly exist and the things which come from them" (*ibid.* 7, 1-3). As a universal rule, Plotinus states that "everywhere ... making (*poiesis*) and action (*praxis*) are either a weakening or a consequence of contemplation" (*ibid.* 4, 39-40). In the first instance, then, action and making are *substitutes* of contemplation; unable to contemplate because of the weakness of their soul, men turn to practice and action, the sensible counterparts of contemplation; in the second instance, action and making are, so to speak, naturally superadded to contemplation. It is so for nature, since, being a result of contemplation, it produces by means of

contemplation: "my act of contemplation makes what it contemplates, as the geometers draw their figures while they contemplate. But I do not draw, but as I contemplate, the lines which bound bodies come to be as if they fell from my contemplation" (4, 7-10). But even in this second type of contemplation, what is produced is weaker than its source: "that which is produced must always be of the same kind as its producer, but weaker through losing its virtue as it comes down" (*ibid.*, 5, 24-25).

It is obviously in this general economy that the particular beauty of the sensible object must be interpreted and ranked; in itself beautiful, the artifact is nonetheless a shadow of a higher and purer contemplation, that can at best remind us of the beauty from which it emanates, but must never be taken as an ultimate goal in itself. Amidst our action, we again long for contemplation: "for men of action too, contemplation is the goal, and what they cannot get by going straight to it....they seek to obtain by going round about it" (*ibid.*, 6, 1-4). The purification, in this context, is necessarily a purification *from the sensible*, a process of detachment by which the human soul recognises the secondary status of the bodily beauties to which it is driven.

### Beauty as an inner quest

How, then, can we catch a glimpse of that unique Beauty reigning above all others? By entering into ourselves. Entering into ourselves means ceasing to be the mirror that reflects the changing images of the external world so that the image of Beauty which lies inside of us may appear, for the Idea of Beauty is, so to speak, everpresent inside the whole of our soul. But its reflection becomes visible only if the endless glittering of external objects is interrupted (cf. I, 4, 10, 6 ss.). Plotinus insists that we "not look. Shut your eyes, and change to and wake another way of seeing, which every one has but few use" (I, 6, 8, 24 ss.).

The quest for Beauty becomes what it, in fact, always was, an inner quest. "For one must come to the sight with a seeing power made akin and like to what is seen. No eye ever saw the sun without becoming sunlike...." (I, 6, 9, 29-30); "just as in the case of the beauties of sense it is impossible for those who have not seen them or grasped their beauty—those born blind, for instance,—to speak about them, in the same way only those can speak about the beauty of ways of life who have accepted the beauty of ways of life and kinds of knowledge and everything else of the sort" (I, 6, 49 ss.).

And, as we have seen, a beautiful thing, be it corporeal or incorporeal, is such by virtue of that inner element with which it is imbued, that Idea in which it participates, that which allows us to call "beautiful" heterogeneous realities, a beautiful painting, a beautiful melody, a beautiful action, a beautiful sentiment, a beautiful virtue, a beautiful science, or a beautiful soul. All beautiful things can be rendered so because of one common element; a single and unique word appears in our minds when we see them: beautiful. And all of them attract us.

"What then are we to think, if anyone contemplates the absolute beauty which exists pure by itself, uncontaminated by flesh or body, not in earth or heaven, that it may keep its purity?" All these other things are external additions and not primary, but derived from it. If then one sees that which provides for all and remains by itself and gives to all but receives nothing into itself, if he abides in the contemplation of this kind of beauty and rejoices in being made like it, how can he need any other beauty? ... Here the greatest, the ultimate contest is set before our souls; all our toil and trouble is for this not to be left without a share in the best of visions. The man who attains this is blessed in seeing that *blessed sight*, and he who fails to attain it has failed utterly. A man has not failed if he fails to win beauty of colours or bodies, or power or office or kingship even, but if he fails to win this and only this. (I, 6, 7, 21-36)

At this stage of our inquiry, we can understand the following: "the treatises Plotinus had devoted to Beauty are not aesthetical treatises, but metaphysical treatises."<sup>7</sup> The splendour of Beauty moves us deeply because it wakes us to ourselves, to that transcendent beauty in which we participate. We can reflect on Joyce's statement in *A Portrait...*: "I desire to press in my arms the loveliness which has not yet come into the world."<sup>8</sup> But why does the Beauty to which we aspire, inspire us so? There is, for Plotinus, one lone answer. Beauty is an offshoot of the Good, which is more ancient, as Plotinus remarks, "not in time but in truth, and has the prior power" (V, 5 [32], 12, 38).

### Beauty as *bonum*

We can, so to speak, briefly summarise the thought of Plotinus with a single formula: "he who seeks beauty seeks goodness". The common element in all that is beautiful, be it music, a deed, a soul, a disposition or a virtue, is their achievement of a certain good, and can be called beautiful only because

they are inspired by the Good. A beautiful symmetry is beautiful only when it derives from the Good, not when it derives from Evil or that which is destructive.

But the relationship between Beauty and the Good, *pulchrum* and *bonum*, is rather complex in Plotinus. The Good is clearly above Beauty. The soul seeks Beauty so that it may attain the Good, and not the other way around: "the Good itself does not need Beauty, though Beauty needs [the Good]"<sup>9</sup>. But, and this goes without saying, the Good itself is by no means devoid of Beauty: "Anyone who has seen [the Good] knows what I mean when I say that it is beautiful" (I, 6, 7, 2-3). In essence Plotinus is here reproducing in his own words Plato's thought, especially as it is expressed in the *Philebus* (64 e 5): "And now the power of the good has retired into the region of the beautiful; for measure and symmetry are beauty and virtue all the world over". In the *Republic* 509a 6, Plato states: "What a wonder of beauty that must be which is the author of science and truth, and yet surpasses them in beauty"<sup>10</sup>. The infinite power of the Good, the Measurer (VI, 7 [38], 30, 34) above all measure, is the first and immeasurable condition of all measurable beauty: "so his beauty, explains Plotinus, is of another kind and beauty above beauty. For if it is nothing, what beauty can it be? But if it is lovable, it would be the geometer of beauty. Therefore the productive power of all is the flower of beauty, a beauty which makes beauty" (VI, 7 [38], 32, 27-29). The Good is, then, the flower of beauty, and as the beautiful things of this world are the *sensible manifestations* of Beauty in itself or the Idea of Beauty, we might say that Beauty in itself is, in a certain analogical way, the *intelligible manifestation* of the absolutely transcendent Good.

Moreover, the soul Plotinus says, is "skilled in finding what it loves, and not leaving off till it catches it" (31, 28-29). Why are we so driven toward the object of our love? In order to revive the vision of the incommensurable Good that lives inside of us:

The experience of lovers bears witness to this, that, as long as it is in that which has the impression perceived by the senses, the lover is not yet in love; but when from that he himself generates in himself an impression not perceptible by the senses in his partless soul, then love springs up. But he seeks to see the beloved that he may water him when he is withering. (VI, 7 [38], 33, 22-27).

Or again: "Then the soul, receiving into itself an outflow from thence, is moved and dances wildly and is all stung with longing and becomes love.... But when

a kind of warmth from thence comes upon it, it gains strength and wakes and is truly winged; and though it is moved with passion for that which lies close by it, yet all the same it rises higher, to something greater which it seems to remember. And as long as there is anything higher than that which is present to it, it naturally goes on upwards, lifted by the giver of its love. It rises above Intellect, but cannot run on above the Good, for there is nothing above" (VI, 7 [38], 22, 8 ss.).

### Beauty as inward openness

We might think, in light of the preceding descriptions of the quest for Beauty and the Good, that the coveted object of the soul lies outside of it. This is not so. Plotinus reminds us that what is "really worth aspiring to for us is our selves, bringing themselves back for themselves to the best of themselves; this is the well-proportioned and beautiful and the form which is not part of the composite and the clear, intelligent, beautiful life" (VI, 7 [38], 30, 36-40).

In what does this clear and beautiful life consist? What is this "best" of ourselves toward which we ought to tend? A certain clarification might be forthcoming if we look at Plotinus' representation of consciousness. The "I" contains all levels of reality which we can distinguish in "external" nature, from the ineffable One-Good down to the Intellect and to the Soul. "And just as in nature there are these three of which we have spoken [the One, the Intellect and the Soul], so we ought to think that they are present also in ourselves" (V, 1 [10], 10 5-6; see III 8 [30], 9, 23). The Good and Beauty are, therefore, always in us," although we are not always conscious of the fact, as when we are unaware of that part of ourselves responsible for the beating of our heart and our other bodily processes. Our consciousness, then, is but a fraction of our total selves, lodged, as it were, between two extremes of which we are, for the most part, unaware:

Why then, when we have such great possessions, do we not consciously grasp them, but are mostly inactive in these ways, and some of us are never active at all? They are always occupied in their own activities, Intellect, and that which is before Intellect, always in itself, and soul, which is in this sense "ever-moving." For not everything which is in the soul is immediately perceptible, but it reaches us when it enters into perception; but when a particular active power does not give a share in its activity to the perceiving power, that activity has not yet pervaded the whole soul. We do not therefore yet know it, since we are ac-

companied by the perceptive power and are not a part of soul but the whole soul (V, 1 [10], 12, 1 ss.).

Entering into ourselves, then, means becoming open to that which lies deepest in us, the Good, which is shrouded by the multiple external objects, of which we, for the most part, bear the reflections.

But how can this openness be imagined? I shall take a very simple example to describe the openness to the Good which is, in itself beyond all acts of consciousness. I am sitting and reading at my desk; the telephone rings, and I make an appointment with a friend to lunch at one, remembering that I must also stop at the bookdealer to pick up a book that I need; but, pursuing my reading, I absorb myself in it, forgetting my meeting and the bookdealer; I am no longer hungry nor thirsty. I feel no need for anything, time has vanished, and I am no longer aware what I am doing. I am totally swallowed up by my reading totally absent to myself, to my body, to the passing of time; the fact is, at the very moment when I am no longer conscious of my activity, it is then that I am truly reading; and when I slowly become conscious of my surroundings, once my consciousness accompanies my act, I am no longer truly reading, at least not with the same intensity. This absence to ourselves which unleashes our inner activity and intensifies its power, is the veritable openness and presence for Plotinus: "Often I have woken up out of the body to myself and have entered into myself, going out from all other things; I have seen a beauty wonderfully great...; Then after that rest in the divine, when I have come down from Intellect to discursive reasoning, I am puzzled how I ever came down..." (IV, 8, 1 ss.).

In the midst of such pure activity, in this unconscious immersion of ourselves into our very depths, we might ask, "who is it that is reading?," since no one is present to state: "it is I who is reading." Plotinus himself exclaims "but we—who are we?" (VI, 4, 14, 16), when confronted with this type of presence, the experience of reading being but a pale reflection.

As P. Hadot explains, we are here faced with "the whole paradox of the human self...: we are only that of which we are conscious, yet we are conscious of no longer being ourselves precisely when, lifting ourselves to a greater inner simplicity, we have lost consciousness of ourselves."<sup>12</sup> This is by far what is most singular for us modern thinkers in the plotinian conception of the true presence: the idea that what is most intimate to us is, in a sense, what is most impersonal. Inwardness is openness, not withdrawal; it lies not at the root of personality but of wholeness which takes us beyond any restrictive

notion of individuality. From this point of view, all of Plotinus' philosophy, is "directed against anthropomorphism,"<sup>13</sup> as the following reflection describes to perfection: "For he has ceased to be the All now that he has become man; but when he ceases to be man he 'walks on high and directs the whole universe'<sup>14</sup>..." (V, 8, 7, 33-35).

Thus, we can find in Plotinus many passages professing the surpassing of the self, or the forgetting of the self:

Conscious awareness, in fact, is likely to enfeeble the very activities of which there is consciousness; only when they are alone are they pure and more genuinely active and living; and when good men are in this state their life is increased, when it is not spilt out into perception, but gathered together in one in itself (I, 4, 10, 28 ss.).

The reader is not necessarily aware that he is reading, least of all when he is really concentrating (I, 4, 10, 24-26).

The more it presses on towards the heights the more it will forget....so that if anyone said that the good soul was forgetful, it would be correct to say so in this sort of sense. For the higher soul also flies from multiplicity, and gathers multiplicity into one and abandons the indefinite: because in this way it will not be [clogged] with multiplicity but light and *alone by itself* (IV, 3, 32, 13 ss.).

The soul, then, is its true self only when it detaches itself from everything, including consciousness, which fragments it, and distracts it from its proper activity. It is a well-known fact. We can cite as an example Braque commenting on his art: "I had learned to paint in accordance with nature, and when convinced that I had to liberate myself from this model [Plotinus would have said "...of the world"], it proved anything but easy. But I set myself to work and with intuitive leaps, the *detachment* that progressively separated me from the model was thus achieved. In such moments, *we adhere to virtually unconscious imperatives*, not knowing what they may bring forth. It is an adventure. *Consciousness is not involved.*"<sup>15</sup>

This presence of non-consciousness within us is that which, for Plotinus, gives us access to our internal beauty which alters and enriches our vision,

since we have seen, "one must come to the sight with a seeing power made akin and like to what is seen" (I, 6, 9, 29-30). And hence, we can cite the following exhortation: "Go back into yourself and look; and if you do not yet see yourself beautiful, then, just as someone making a statue which has to be beautiful cuts away here and polishes there and makes one part smooth and clears another till he has given his statue a beautiful face, so you too must cut away excess and straighten the crooked and clear the dark and make it bright, and never stop 'working on your statue'..." (I, 6, 9, 7-13).

The aesthetics of Plotinus is thus, above all, a purification of the soul, an ethical and metaphysical experience where the soul contemplates that Beauty which is penetrated by the Good. This contemplation culminates in the grace and the delight *vis-à-vis* what is and what, inside of what is, shines from a unique fire. We can also say, from a different angle, that the contemplation of Beauty is a sort of exercise, an initiation to ecstasy. Innumerable artists and writers have spoken of the deep-felt need to continually immerse themselves into their work, into their creative activity, which appeals to them as the abode of their most profound identity, an identity though that they themselves cannot seize, or at least, about which they cannot say anything precise except may be that it somehow renders them free. It is within this singular identity, this identity without point of reference, that the artist confesses both his greatest detachment from, and his greatest communion with everything, in other words, the sense of the greatest universality.

This state which brings us closer to divinity is what Plotinus, more or less, conceives as grace, a state of perfect happiness and sufficiency. So, his aesthetics, like that of Ficini, Schiller, Ravaisson and most notably Bergson, is one of grace. Bergson wrote:<sup>16</sup> "In all that is graceful, we sense a sort of surrender, like a condescension. Likewise, whoever contemplates the world with the eyes of an artist, it is grace that is traceable in Beauty, and it is goodness that shows itself through grace."<sup>17</sup>

### Summary

The aesthetics of Plotinus proceeds, according to the ancient alliance between pulchrum and bonum, from sensible beauty to the beauty of the incorporeal and then culminates in the pure vision of Beauty as such, itself invested with the infinite power of the Good, the true object of the quest. But this aes-

thetic is, above all, an inward odyssey toward oneself, for the path opened by the Good is the one that our soul must itself open, hence, the task rests on each of us to cease being the mirrors of evanescent realities and to veritably want to attain to grace.

## Notes

1. I am greatly indebted for the pages that follow to the translation-commentary of P. Mathias, *Plotin. Du Beau, Ennéades I, 6 et V, 8*, Paris, 1991, and to P. Hadot's, *Plotin ou la simplicité du regard*, Paris, Gallimard, 1997.
2. *Life of Plotinus*, 1, 1-2. The English translations of Plotinus throughout this paper are those of A. H. Armstrong, Plotinus, *Enneads*, in seven volumes, Harvard University Press, 1966-1988.
3. Cf. E. Panofsky, *Idea. Contribution à l'histoire du concept de l'ancienne théorie de l'art*, trad. H. Joly, Paris, Gallimard, 1983, 44: "Plotinus, for whom the progression that leads from unity to multiplicity also leads from perfection to imperfection, is explicitly and passionately opposed to this definition of beauty which was associated with 'the balance of proportions' and 'the beauty of colors', by classical antiquity and the Renaissance."
4. Cf. E. Panofsky, *ibid.*, 39: "the philosophy of Plotinus undertakes to obtain for the 'inner form' the metaphysical right to merit the status of a 'perfect and supreme model.' Plotinus had, in effect, deliberately protested against the attacks Plato had formulated concerning 'mimetic art.'"
5. The Zeus of Pheidias, an attempt by Pericles to embellish the athenian image, was considered as one of the "seven wonders of the world" in antiquity.
6. Cf. *Symposium*, 211c.
7. P. Mathias, *op. cit.*, 5: "As Plotinus teaches, it is equally true that being and beauty accompany each other, their very nature being identical (V, 8 [31], 9, 42). In this sense, we can say that Plotinus does not hold a specific concept of Beauty, and indeed, as we have seen when he disallows its identification with the concept of symmetry, he omits any such possibility. So, the beautiful cannot really be a characteristic or attribute of being, or something that can be representative of a certain category of being, rather, beauty is being, or otherwise, it is the expression or the name for the plenitude of being as such."
8. *A Portrait of the Artist as a Young Man*, The Modern Library, New York, 1916, 297.
9. V, 5, 12, 32-33. The proof of the Good's higher independence and value is as Plotinus says a little earlier (19-20): "All men think that when they have attained the Good it is sufficient for them."
10. In the *Symposium*, 211c, it is Beauty, rather, that is given as the supreme goal of the soul's ascendance.
11. Cf. IV, 8, 8, 1 ss.: "And, if one ought to dare to express one's own view more clearly, contradicting the opinion of others, even our soul does not altogether come down, but there is always something of it in the intelligible."

## Personal Beauty in the Thought of Plotinus

Joseph Sen

ὁ μὲν γὰρ καλὸς. ὅσον ἴδην. πέλεται [καλὸς],  
ὁ δὲ κάγαθὸς αὐτὶκα καὶ καλὸς ἔσσεται.

— Sappho

### I. Introduction

If the contemporary literature on aesthetics were taken as a gauge, personal beauty might appear of peripheral significance to human life. For the predominant concern is works-of-art, objects rather than subjects. The interests of philosophers here diverge from the everyday, where the beauty of other persons stands as one of the most immediate and primordial experiences we can have. By contrast, the joys of art may often pass unnoticed. Why this neglect exists is a question that can only be touched upon here. Perhaps the fear is that anything will go in this area, that attention to the subject would herald an embarrassing collapse into subjectivism. Another concern might be the gratuitous quality which seems to surround personal beauty, especially when this is just taken in physical terms. It may then appear as a feature either brutally given or not and so incapable of provoking the kind of admiration which matches the sense of *achievement* found in a work of art. Platonic thought has, however, always challenged the assumption that this is a subject too flimsy to warrant philosophical notice. While Plotinus may differ from Plato in the unservedly positive status he assigns to art, both share a conviction about the philosophical vitality of personal beauty.<sup>1</sup> The distinctive way in which Plotinus articulates this conviction will be treated here, but Plato will never be far away from our reflections. These will centre on two themes. We will first look at the

way Plotinus encourages us to move away from thinking of personal beauty in physical terms by emphasising its relation to interiority. This is a familiar move in the *Enneads*. But the second theme is less documented, and needs more unfolding. It has to do with the way this understanding leads to a tacit role for *time* as the form of experience in which personal beauty comes to view.

## II. Picture Imperfect

There is a tendency to take personal beauty as a fixed quota, something possessed unbrokenly, for a definite period of life. The view is taken by Aristotle in the *Rhetoric*:

Beauty is different for different ages (ἡλικία). A youth's beauty consists in having a body that is serviceable for exertions in running and physical force, and pleasant to look at for gratification. This is why the all-round athletes are the most beautiful, since they are naturally suited both for physical force and for speed. Beauty in someone in the prime of life consists in having the body serviceable for exertions in war, and in being both pleasant and formidable to look at. Beauty in an old man is having a body adequate for necessary exertions, and not painful to look at, because it has none of the deformities that mark old age (1361b7-14, trans. Irwin and Fine).<sup>1</sup>

Aristotle here links beauty with three factors: the body, visuality and time. Beauty remains consistently bodily and visual but varies according to the age of the body we are considering. By so permitting each stage of life its own beauty Aristotle avoids ageism. He would not go along with the rather monochrome view prevalent in our times which allows the beauty of youth to exercise a tyrannical sway. But while allowing for this diversity Aristotle still takes the beauty of these different periods of life to be *enduring*. For example, the beauty of youth remains for a continuous stretch of time and does not just "come and go." It is as constant as the physical setting in which it is found.

Plotinus has something to say about this:

The same bodies appear sometimes beautiful, sometimes not beautiful, so that their being bodies is one thing, their being beautiful another (1.6.1.14-16).<sup>2</sup>

Plotinus is not merely repeating Aristotle and saying that the criterion of beauty varies for different stages of life. It is a narrower temporal span to which he refers, a matter, we might say, of moments rather than years. According to

Plotinus the same physical face can appear beautiful at one time, and not beautiful at another where these times follow closely upon one another. Crucial here is that while the spatial proportions of the face remain invariant, its beauty wavers. Plotinus is suggesting that even if a face has perfect bone structure, this is neither a sufficient nor even a necessary condition for beauty, since there are times when the beauty "comes through" and others when it does not.

We may disagree with Plotinus if we think that a face is beautiful unconditionally—*over* time rather than *at* a time. Commonsense might also favour Aristotle to the extent it construes personal beauty as physical and as a constant. When beauty is present, it is there in a strong sense, for several years at a go, it has a continuous presence. It is this attribution which Plotinus is questioning.

A suggestion here why Plotinus' view might look strange to us. Perhaps when it comes to beauty the tendency is to assume that it is all the same, whether we are dealing with works of art or persons. The beauty of a painting, for example, might seem to be a property present once and for all—barring fire and vandalism. This lends the beauty a certain immobility. Emmanuel Levinas, a rather unsung Platonist, puts this well:

Within the life, or rather the death, of a statue, an instant endures infinitely: eternally Laocoon will be caught up in the grip of serpents; the Mona Lisa will smile eternally. Eternally the future announced in the strained muscles of Laocoon will be unable to become present. Eternally, the smile of the Mona Lisa about to broaden will not broaden. An eternally suspended future floats around the congealed position of a statue like a future forever to come. The imminence of the future lasts before an instant stripped of the essential characteristic of the present, its evanescence. It will never have completed its task as a present, as though reality withrew from its own reality and left it powerless. In this situation the present can assume nothing, can take on nothing, and thus is an impersonal and anonymous instant.<sup>3</sup>

Levinas here collates two arts—sculpture and painting—which Plotinus would want to keep separate. But instructive here is the claim that these works of art lack genuine temporality. The beauty of the Mona Lisa is striking but static, subject neither to change nor development. It remains interminably present within the space of the painting.

It might be retorted that this point is downright trivial! Of course, the beauty of a painting doesn't change: otherwise we wouldn't be talking about a

painting!<sup>4</sup> But the question here is whether our attitude to paintings influences our appreciation of personal beauty. For perhaps when it comes to personal beauty we tend to transpose our way of thinking about paintings to living beings. On analogy, we thereby easily but mistakenly assume that personal beauty is also a property which is spatially and statically present in a person. Thus thinking a face beautiful, we take this beauty as inalienable like the smile on the Mona Lisa. But Plotinus encourages further thought. Personal beauty may be more a *temporal* than a spatial property, and one which can come and go within moments rather than years. The perception of personal beauty here becomes more a matter of witnessing an *event* than seeing a *thing*.<sup>5</sup>

### III. Beauty and Life

On what then does the appearance of beauty depend? What brings it to view? If we leave aside talk of "form" a more accessible lead is found in *Ennead* VI.7:

... here below beauty is what illuminates good proportions rather than the good proportions themselves, and this is what is lovable. For why is there more light of beauty on a living face, but only a trace of it on a dead one, even if its flesh and its proportions are not yet wasted away? And are not the more lifelike statues the more beautiful ones, even if the others are better proportioned? And is not an uglier living man more beautiful than the beautiful man in a statue (VI.7.22.24-32)?

The argument is controversial but sound granted the premise that whatever has life has beauty. To the extent then that a body is animated it possesses a minimum of beauty. This means that anything which has soul is beautiful since soul is, on Platonic terms, the bearer of life. Plotinus even goes further than this, claiming that the activity of soul is causally responsible for every kind of beauty found in actions, ways of life and bodies—everything, that is, apart from Intellect and the Good where beauty and life have their proper residence.<sup>6</sup>

But we might still want more explanation how one living being can be more beautiful than another. Animation won't suffice here, since this only accounts for a beauty which effectively amounts to the lowest common denominator. Plotinus himself wants to make room for judgments of a higher order

than this by indicating elsewhere that soul is not beautiful by itself, since otherwise it would not be possible for one soul to be wise and beautiful, and another stupid and ugly.<sup>7</sup> Both we might say are beautiful relative to the corpse but when compared one soul can still be more beautiful than the other.

In what then does this "additional" beauty consist if not animation? It needs to be emphasised that the concept of life is not superfluous for an explanation here so long as we keep in view the semantic depth it assumes in Plotinus's hands. For life in this context is by no means exhausted by its manifestation in living beings which only represent its tail end, so to speak.<sup>8</sup> Crucially for Plotinus, when we come to a richer understanding of life we see its synergy with thought:

And every life is a thought, but one is dimmer than another, just as life . . . But perhaps men may speak of different kinds of life, but do not speak of different kinds of thought but say that some are thoughts, but others not thoughts at all, because they do not investigate at all what kind of thing life is. But we must bring out this point, at any rate, that again our discussion shows that all things are a by-product of contemplation. If, then, the truest life is life by thought, and is the same thing as the truest thought, then the truest thought lives, and contemplation, and the object of contemplation at this level, is living and life, and the two together are one (III.8.8.17-30).

Once again we find Plotinus turning everyday conceptions on their head. We are not to think of thought as a manifestation of life but life as a manifestation of thought. Thought here does not mean deliberate, discursive thought. It is a more effortless and holistic kind of thought which Plotinus has in mind.<sup>9</sup>

This identity of thought and life is usually hard for us to grasp given their apparent disjunction in the physical world.<sup>10</sup> It is only in Intellect that their full identity is realised. According to Plotinus this heightened thought-life comes to operate in a wise soul. And given the co-extension of life and beauty, greater beauty is therefore displayed:

Intellect and the things of intellect are its beauty, its own beauty and not another's, since only then is it truly soul (I.6.6.17-18).<sup>11</sup>

The insistence that the soul is only truly soul when living from Intellect reminds us of the axiological dimension which the concept of soul has for Plotinus.<sup>12</sup> A wise soul is soul in its fullest sense so far as it shares more in the

greater life and beauty of Intellect where its higher identity is found. In fine, the wise soul is more beautiful than the stupid not because the latter lacks life but because of the former's greater, indeed "abundant" (*ἄγαν*) life.<sup>13</sup>

#### IV. Beauty and Time

The life to which Plotinus refers so exuberantly is inwardly realised, by moving into the self, towards the beauty of Intellect and the Good. But what is discovered inwardly is diffusive. Once realised the inner life has power to appear and enliven the external which means it is no longer merely "inner." If we bear this in mind we gain a better handle upon the following remark:

But perhaps it is not really possible for anything to be beautiful outwardly but ugly inwardly; for if the outside of anything is wholly beautiful it is so by the domination of what is within. Those who are called beautiful and are ugly within have an outward beauty, too, which is not genuine. But if anyone is going to say that he has seen people who are really beautiful but are ugly within, I think that he has not really seen them, but thinks that beautiful people are other than who they are (*II.9.17.40-46*).

Commonsense takes its bearings from physical beauty and would only grudgingly allow the concept an inward dimension. But Plotinus takes an equally one-sided stance, insisting so firmly on the priority of inner beauty that a merely external beauty is left struggling for recognition. Plotinus' thought is radical and revisionary here. He is not describing what normally passes for beauty but telling us how mistaken the usual view is and putting another in its place. He does not merely subordinate physical beauty, but denies its status altogether. The task is not to weigh priorities—the inner with the outer—for the error lies in assuming two alternatives to begin with. Only interior beauty *is* beauty.

But what are we to make of this? Plotinus is after all making sham of everyday judgments. Surely we can call someone beautiful irrespective of the wisdom and virtue in their souls? Can we make any sense of Plotinus' inversion? We would be hard pressed to make a compelling case for Plotinus given his normative tone. Even he admits that his approach is not for everyone.<sup>14</sup> But his perspective may not be so alien as it at first appears. Clearly there is no *patent* way in which we connect beauty with goodness or virtue. But is there

an *implicit* association? Consider the case of someone initially taken for beautiful turning out on closer acquaintance to be deceitful or vicious. Would we thereafter still feel inclined to call them beautiful? We might want to stay with "attractive" but "beautiful" might no longer seem so fitting a description. Of course, we may go on using the term should we find no positive, ethical grounds for doubt: beauty in this sense is innocent until proven guilty. But might not the perception of a serious flaw warrant a change in our understanding?

Plotinus presents another scenario. A man with an ugly face may come to be judged beautiful once we discover his virtue.<sup>15</sup> This brings to mind Alcibiades' eulogy to Socrates in the *Symposium*. Socrates, he tells us, is like one of those statues of the god Silenus which contain little figurines within:

Whether anyone else has caught him in a serious moment and opened him, and seen the images inside, I know not; but I saw them one day, and thought them so divine and golden, so totally beautiful (*πάγκολλα*) and wondrous, that I simply had to do as Socrates bade me (*216E-217A*).<sup>16</sup>

It should be noted here that Alcibiades' discovery hardly comes in a flash but dawns upon him over time. If all he ever had to go on was Socrates' physical appearance he might well have remained repelled by the sight of the old man with the squashed nose and squinting eyes. But subsequent acquaintance brings to his notice a beauty in Socrates' words, actions and even his nonactions which, invisible to first sight, remains so to all who do not go through a like experience. But without the movement of time this acquaintance presumes Alcibiades would have never transcended his first impression.

This offers a way of uncoupling merely external beauty from its genuine, inward counterpart. While the first grabs us immediately and is largely a matter of effortless "spotting" in space, the second only makes a gradual appearance and requires discovery through the course of time. Related to this is the fact that external beauty is available to one and all; to this extent it is egalitarian but also commonplace. By contrast, insight into personal beauty is a kind of privileged access *won* through acquaintance. It is by no means given to all, its recognition being a matter of time and individual experience. Recall that Alcibiades draws attention to Socrates' beauty not by pointing in space but by recounting his various experiences with Socrates, a *history*, in other words, the details of which only he can fully know.<sup>17</sup>

## V. Conclusion

We have so far seen how Plotinus encourages a shift away from a physical, "spatial" understanding of personal beauty to one centred on interiority. But we have also observed – and perhaps unexpectedly – how far recognition of this beauty depends upon time, although Plotinus never makes an explicit theme of this.<sup>18</sup> Now the goal for Plotinus is not to remain enraptured by any object of vision, however impressive. The reflexive turn is always imminent.<sup>19</sup> Plotinus emphasises how appreciating the beauty of another's virtue is difficult unless we have realised the same in ourselves.<sup>20</sup> But this requires a work of its own much akin to the artist's. Each of us must work on our own statue and this is a project which is quite senseless outside of a temporal context.

Still, the beauty eventually unveiled is always present within the self. It is not so much created as *realised*.<sup>21</sup> The difficulty for us here is coming to terms with Plotinus' insistence that it is not only the *feeling* but the *content* of the experience of beauty which lies within. Fathoming the mystery of this proximity is a challenge Plotinus has left to us.

Let me close with ■ refrain: "Isn't an ugly living man more beautiful than a beautiful man in a statue?" The rhetorical tone might look naïve since Plotinus takes for granted what is far from obvious. Some might not want to mention the two men in the same breath, so great appears their disparity. But pause for a moment and consider a world where this thought did ring true, where the ethical took precedence over the aesthetical while remaining the domain of beauty, where our living contemporaries were always more important to us than any work of art. Perhaps such a world was a reality for Plotinus. Were it to become so for us I venture to say that ours would not only be better, but even on the whole more beautiful.

1. In *Aristotle: Selections*, (Indianapolis, Ind.: Hackett, 1995), 528.
2. Translations from Plotinus' *Enneads* follow those of A.H. Armstrong in the Loeb Classical Library edition, 7 volumes, (Cambridge, Mass.: Harvard University Press, 1966-1988). *Ennead*, chapter and line numbers follow P. Henry and H.R. Schwyzer's *Plotini Opera*, 3 volumes, (Oxford: Clarendon Press, 1964, 1976, 1982).
3. "Reality and its Shadow," in *The Levinas Reader*, Sean Hand (ed.), Cambridge University Press, 133.
4. Our appreciation may, of course, change; but this is a matter of recognising what we take to have been previously present but unnoticed. There is realism here, perception is never invention.
5. This claim appears trivial if taken to mean that *eventually* personal beauty is subject to time. But Plotinus' point is stronger, personal beauty is constantly related to time, and specifically, as we shall see, the life of the soul which manifests itself in time.
6. Plotinus, *Enn.*, I.6.6.27-33; see also I.6.9. 3-7: "So that the soul must be trained, first of all to look at beautiful ways of life: then at the beautiful works, not those which the arts produce, but the works of men who have a name for goodness; then look at the souls of the people who produce the beautiful works." The drive here is from the objective to the personal. While the concern with beauty remains a shift takes place from the aesthetical to the ethical. This suggests a measured stance towards art which is close in spirit to Plato.
7. Plotinus, *Enn.*, V.9.2.18-20.
8. For the multivalence of life see I.4.3.
9. This interplay between life and thought might be understood more concretely. Sometimes we find ourselves in a rather indifferent state of mind which is broken by a thought coming upon us suddenly. Perhaps we hear a remark or grasp an idea which gives a sort of jolt to our system, waking us up and making us feel more invigorated. Or think of the animated gestures of someone deeply engaged by what they are saying. The point here is that the presence of the thought *shows* itself in heightened animation. The proper word for this is *vivacity*.
10. "For as in the portrait (εἰκόν) of a man many things are wanting, and especially the decisively important thing, life, so in the things perceived by sense being is a shadow of being, separated from that which is most fully being, which was life in the archetype" (VI.2.7.11-14).
11. "So beauty in the soul comes by wisdom. And what is it, then, which gives wisdom to the soul? Intellect, necessarily an intellect which is not sometimes intelligent, and sometimes not intelligent, but the true intellect" (V.9.2.20-22).
12. See also V.9.13.7-8.

13. Plotinus, *Enn.*, I.4.3.24-26. See also I.4.3.33-37: "We have often said that the perfect life, the true, real life, is in that transcendent, intelligible reality and that other lives are incomplete, traces of life, not perfect or pure and no more life than its opposite. Let us put it shortly; as long as all living things proceed from a single origin, but have not life in the same degree as it, the origin must be the first and most perfect life."
14. Plotinus, *Enn.*, V.8.2.45.
15. Plotinus, *Enn.*, V.8.2.38-41. A question here is whether our respective judgment alters our perception of the face by a sort of "looping" effect so that it no longer really seems so ugly. Continuing to speak of its ugliness might then be more of a concession to the common understanding of beauty rather than an expression of individual experience.
16. Trans. W.R.M. Lamb [modified], Plato, Loeb Classical Library, vol. 3. (Cambridge, Mass.: Harvard University Press, 1925).
17. Which reminds us that Alcibiades' knowledge of beauty comes through acquaintance, while ours is gained only through the description he provides.
18. Given the strong links between beauty and life we might expect some such reference to time. Ordinarily, the life of an embodied being is understood to be *its* time. We might, of course, expect more connection between beauty and eternity within a Platonic context. But we should bear in mind that eternity is not a static condition for either Plato or Plotinus. Both are keen for any notion of a transcendent reality to accommodate life, movement and activity — categories which certainly have a temporal ring to them. Plato's clearest statement of this comes in the *Sophist*: "But tell me, in heaven's name, are we really to be so easily convinced that change, life, soul, understanding have no place in that which is perfectly real — that it has neither life nor thought, but stands immutable in solemn aloofness, devoid of intelligence?" (*Sophist*, 249a, trans. Cornford). On this question A.H. Armstrong has argued that there may be a way in which the motion in the intelligible world belies the presence of a form of time (see his "Eternity, Life and Movement in Plotinus' account of Nous," in *Le Neoplatonism*, Colloque International du Centre National de la Recherche Scientifique, 1969, Royaumont, 67-74; 73).
19. Generally, Plotinus tells us that whenever we admire the beauty in another, we admire the beauty in ourselves (V.1.2.50-51).
20. Plotinus, *Enn.*, V.8.2.41-44.
21. Plotinus indicates this by employing the analogy of sculpture rather than painting for the procedure of taking away (*ἀφαίρεσις*) which brings the ideal self to view (see, for example, I.6.9.6-15). Sculpture is no less a creative art than painting but the activity involved is distinct. The sculptor is more concerned with the removal of the obstructions which prevent a vision of the work-to-be. The physical activity involved is negative, for its end somehow seems more present in the

stone. It's as if the sculptor is simply exposing to view what was already latent. As Aristotle remarks, we can speak of seeing Hermes in the uncarved stone (*Metaphysics* V, 1017b6-7); but could the same be said of the picture in the bare canvas?

## The Beautiful According to Dionysius

Dimitrios N. Koutras

The concept of the “beautiful” (καλόν) in Dionysius’ teaching is developed primarily in his treatise “*De divinis nominibus*.” The influence of Plato’s philosophy and of Neoplatonism, of Plotinus and particularly of Proclus, is obvious. Thus, M. Beardsley<sup>1</sup> is right when he says that Dionysius’ view that the sensible is the correlative of the invisible derives from Plato’s doctrine of Ideas, while his theory of emanation originated with Plotinus.

What we should particularly notice in Dionysius’ teaching on the beautiful is the functional nature of the icon, of the symbol in the metaphysics of light, and of his doctrine of emanation.

According to ancient Greek philosophy the concept of καλόν, “beautiful,” must be examined both in itself and in relation to the *good* (ἀγαθόν). The categories of the *beautiful* and the *sublime*, as is well known, became a controversial issue during the 18<sup>th</sup> century in Western Europe. However the concept of the “beautiful” in ancient Greek philosophy had a universal meaning, which, in the field of Metaphysics, the general doctrine of Being, was not confined to the narrow framework of aesthetics.

The “beautiful” in Plato’s work was found to be closely related to the *Good* as “καθ’ αὐτό αἰρετόν,” i.e. as that which should be chosen as an end-in-itself. Everything else is subjected to it as a means. The “beautiful” should never be considered as a means to something else.

In Plato’s philosophy one can see that there is not only a close relationship between the Idea of the *Good* and that of the *beautiful*, but also that often the former is replaced by the latter. Both Ideas are of overriding importance in Plato’s philosophy. In the *Symposium* the loving soul only meets true “beauty” at the end of its journey. It passes first through the variety of Forms of the beautiful, up to the level of the One, the μονοειδές, exactly as it appears in the

*Republic*, where the Idea of the *Good* surpasses everything, abiding beyond them all. It seems that the idea of the *beautiful* in Plato's philosophy surpasses every other being in degree, just as the Idea of the *Good*. One can also see that the gradation of Being, in the journey undertaken by the loving soul towards it, is found to correspond with that of the beautiful.<sup>2</sup>

The question, however, is: Does Plato's description in the *Symposium* of the soul's ascent through every grade of the beautiful and the lonely passage of the "sensible" on its way to the intelligible beauty, really aim at showing the gradation from the merely *beautiful* to true *beauty* or simply a parallel gradation of the Being, which is identified by him with the beautiful?

As indicated above, for the ancient Greeks the idea of the *beautiful* has a metaphysical character. This explains its close relation to, or even its identification with, the *Good* in Plato's work. There is no doubt that for Plato the *beautiful* differs from the *Good*, since the latter is beyond intellect and essence, and therefore inaccessible. Thus the "beautiful" in Plato, and later in Neoplatonism, constitutes the external appearance of the *Good* as well as that of Being. In fact, it is the value dimension which is actualized in the ascending process of the loving soul in every teleological approach to the beautiful.

The beautiful as an idea, according to Plato, is "ἐκθανέστατον"<sup>3</sup> and "ἐρασμιώτατον" (most "revealing" and "lovable"). By its nature, it tends to unfold on the horizon of the senses; it appears and manifests itself as light. This property motivates the love (ἔρως) of the soul. Love, as Proclus says, is "ἐπιστρεπτικός,"<sup>4</sup> a return to the "beautiful."

From the preceding it becomes clear that in the anagogic function of the beautiful, as described strikingly by Plato in the *Symposium*, lies one of its ontological structural elements. At the same time, the "beautiful" also reveals a universal structure of Being, which, in opposition to the "Good," is manifested and unfolded in the sensible world, in such a way that it plays the role of mediator between the idea and the sensible reality, Being and Becoming, *appearance* and *participation*.

I consider the preceding discussion to be a necessary prerequisite for the understanding of both the Neoplatonic and Dionysian teaching on the "beautiful." It should be pointed out, however, that the image (εἰκὼν) plays an important role in their approach. In Plato's philosophy the *image* constitutes the *eidolon* and the *imitation* of the idea. On the contrary, in Neoplatonism, the *image* obtains an ontological significance. It does not imitate the Idea in the manner of a shadow, but reveals it.

The *image* is the product and offspring of the Form (εἶδος, ἰδέα), although it has a different character. Ontological dependence means affinity and not identity. The *paradigm*, as a formative principle, acts on the underlying matter of the image. The image is the potency and the potentiality. The paradigm is itself the actuality. The image is also found to be in a dynamic relation to the archetype; it tends to assimilate itself to it, as much as possible. At the same time the image is a kind of resemblance (ὁμοίωσις). It exists on account of its affinity with the archetype. The resemblance minimizes the degree of difference. Nevertheless, the resemblance does not remove their radical difference. Archetype and image never coincide, that is, they are never identical with each other, because, as we know, similar things always include difference.

The Neoplatonists and Dionysius repeatedly and figuratively refer to the idea of light, in order to point out the relationship between the paradigm and the image. Without light, and object not only does not seem to be beautiful, but it cannot be beautiful. Thus, the beauty of the beautiful object appears, as *splendour* (ἀγλαΐα). Light is not exclusively identified with its brightness. Light is visible, when it renders the other objects visible.

"Light," for Plotinus, distinguished as it is by its ability to approach the limits of the incorporeal<sup>5</sup>, is placed at the top of the sensible and intelligible world. For Dionysius light and the sun are God<sup>6</sup> himself, who, by his rays radiates the hierarchical orders of the Angels and of the Church. Everything is immersed in the light of the superessential goodness. Light grants them life and saves them. It recalls all things from darkness. When they are illuminated through the divine light, they acquire boundaries and form. Entering the sphere of light they obtain ontological significance. By illumination they escape darkness.

Darkness is the enemy of light. The presence of light drives away darkness. Darkness is entirely *non-being*; it has no essence, nor is it a principle: it is a lack and privation of light, a sub-hypostasis (παρυπόστασις)<sup>7</sup> and false idea.

In connection with light, the Neoplatonists employ the notion of emanation. According to their theory beings flow from the profusion of the inexhaustible source, which does not itself undergo any ontological diminution. What is new in the Neoplatonic theory of emanation, is that it goes beyond the limits of previous Greek philosophy on substance, due to its conception of the process of emanation of the *many* form the *One*. The *One* does not only dimin-

ish in its substance, but also it contributes to the increasing of Being. Thus light, though shining upon its objects, does not undergo any diminution<sup>8</sup> of its substance.

The objects participating in the properties of the light-giving source, participate also in light itself and in its illuminating rays. The presence of the source allows communication with it and renders visible the surface of the objects. The colours which are visible on the surface of bodies are derived from the existing conflict between light and darkness. The visible objects convey the *splendour* (ἀγλαΐα) of their brightness from their contact with light, while, at the same time, light itself remains indivisible (ἀμερὲς)<sup>9</sup> and above everything else.

The concept of the icon involved in Dionysius' teaching on the *beautiful* merits particular examination. Undoubtedly his aesthetic theory follows the Neoplatonic tradition. He shares Plotinus' and Proclus' understanding of the beautiful, but his contribution to aesthetics is not so significant as that of these authors. In my view, the personal contribution of Dionysius is to be found in his efforts to reveal the symbolic and anagogic nature of the icon.

The icon, according to Dionysius, is the symbol of the intelligible world and of divinity. Plotinus expresses the same belief, but does not state it so clearly. Besides, in Dionysius the emphasis is on the principle of the "beautiful." In Plotinus, the *beautiful* originates in the *One*, or Beauty (καλλοσύνη)<sup>10</sup>, but emphasis is placed on the role of the *intellect* (νοῦς).<sup>11</sup> In Dionysius, on the contrary, the source of the beautiful is God.<sup>12</sup> Sensible beauty is a theophany, projected on the horizon of phenomena.

In Plato's philosophy, artistic beauty occupies a lower level than natural beauty. The physical form is closer to the idea of the "beautiful" than the artist's image. The image as an imitation is, for him, far removed from the truth and the idea of the beautiful. Aristotle, later on, will restore art, because he does not consider it to be a simple imitation; the *form*<sup>13</sup> of the work of art and of art itself exists not in nature, but in the artist's soul. The work of art, according to Aristotle, bears the mark of form, which derives from the soul of the artist.

It is Plotinus who first discusses the subjective nature of the work of art. The work of art as an intentional object, no longer constitutes an imitation of natural objects, but is an intellectual achievement. Art acquires a metaphysical dimension; it is a reflection of intellectual intuition, expressed in solid form. The classical conception regarding beauty as harmony and symmetry, is rejected by Plotinus.

According to Plotinus, sensible beauty is not derived from the external

form of matter. Not the external, but the internal form, existing in the artist's soul is that which, completed by the intellectual intuition, manifests itself in sensible matter. Beauty, for him, is "μᾶλλον τὸ ἐπὶ τῇ συμμετρίας ἐπιλαμπόμενον ἢ τὴν συμμετρίαν."<sup>14</sup> Thus, art, at this stage, is considered to be the hierophant of the intellect<sup>15</sup>; it does not imitate natural forms; it simply uses them to express metaphysical contents.<sup>16</sup> In this way he places the *Idea* in the domain of the senses, i.e. the universal in the particular. Hence for Plotinus the image becomes the sensible presence of the paradigm; it is both a *shadow* (σκιά) and a sensible form (εἶδωλον) of the *idea*.

In Neoplatonism "beauty" itself is the *intellect* (νοῦς), the domain of Being and truth. The intellect, according to Plotinus, constitutes the basis of intelligible beauty, the principle from which derives the beauty of the soul and of the body. The "Good" (ἀγαθόν), i.e., beauty in itself (καλλοσύνη)<sup>17</sup> is the transcendental principle of intelligible beauty.

As has already been suggested, the "beautiful," according to Plato, depends directly on the *Idea* of the "Good," on the *Idea* of "Goodness." The beautiful is, for him, a medium through which the good manifests itself. In the "*Philebus*" Socrates, searching for the *Idea* of the Good, is forced to have recourse to the "*nature of the beautiful*."<sup>18</sup> He attempts, through the image, the offspring, to approach its creator.

As pointed out earlier, according to Plato, beauty possesses two properties: it is "revealing" and "lovable" *par excellence* ("ἐκφανεστάτον")<sup>19</sup> and ("ἐρασμιώτατον"). It radiates and shines like the light. Beauty and light have the capacity to display their presence; they illuminate the surrounding world. They descend on objects and make them translucent. They appear and reappear, expand and multiply in the illuminated bodies. The enlightened bodies, in turn, rise up and aim towards light and beauty. They are stimulated by beauty in the same way as the sense of sight is stimulated by light. Sight becomes the desire of illuminated bodies, the contemplation of the source of their origination, that is, Beauty in itself.

"Beauty" and "light," according to the Neoplatonists and Dionysius, have an attractive nature. Their appearance excites admiration. They attract and captivate vision as long as they do not fully reveal themselves, but simply appear in the lighted bodies. Their fascination is mainly due to the way in which they summon objects to their presence, while, at the same time, revealing and concealing themselves. The *splendour* (ἀγλαΐα) of the bodies tacitly declares their presence and invites (καλεῖ).<sup>20</sup> In Dionysius, in particular, light and beauty have attractive attributes. They invite everyone to a common vision.

The visible icon in Dionysius is the presence of the divine light. The light ray which originates in the divine is present in the icon. The divine itself is within the icon and the icon is the manifestation (ἐκφάνσις)<sup>21</sup> of the divine. The icon is possessed by the divine light. The divine is entirely present in the icon, its stamp is on each impression.<sup>22</sup>

The relation between the divine and the icon, according to Dionysius, is analogous to that of light and its appearance. The icon is a representation of divine light, of divine beauty. It appears through its light. Without light there can be no appearance. The appearance is the manifestation of light. Light<sup>23</sup> is manifested in its appearance and, in some way, is diffused through it.

As a figure which reveals the divine<sup>24</sup> the icon refers to it in the same way as oral speech refers to internal thoughts. It becomes a symbol, i.e. a confluence of two different factors. The confluent factors join in the symbol. In the icon the confluent factors are matter and light. Through its *splendour* (ἀγλαία) the enlightened *matter* expresses perfectly its contact with the divine light.

Every symbol has, by its nature, a dual function. It functions both as a sign and as an image. As a sign it points to the signified and as an image it constitutes a self-contained reality. A national symbol, for example the flag, points to the idea of the nation, but, at the same time, the nation exists within the flag which represents it. From this point of view the icon, according to Dionysius, supports the divine. It expresses it sensibly. In the material shape the particular co-exists with the universal, the finite with the infinite.<sup>25</sup> The divine become sensible intuition and matter discards its humiliating nature. As a symbol of the divine the icon expresses God's concession to save the believer's senses, in a way analogous to the Logos made flesh.

The icon is metaphysically dependent on the divine, but is, moreover, enriched in its very being as representation of the divine. The incarnation of the divine through the icon symbolizes the incarnation by Christ of the eternal nature of divinity. In this way through divine consent, the divine represented by the icon somehow becomes incarnate, removing the weight of matter from the sensible form. This is the reason why the sensible beauty of the icon escapes decay, rises up and leads us to the sanctuary of the divine. It becomes the bridge connecting earth with heaven.

In reality the icon with its beauty constitutes the principle of ascending<sup>26</sup> return to the divine. The ascending function of the icon is due to God's illumination through the process of emanation. Again, the emanation of light from God constitutes for the icon a real ascent (ἀναγωγή)<sup>27</sup> which is analogous to

the actualized reception of light by it. The more light the icon receives from the ocean of divine light, the easier it ascends to the divine and the brighter and more elevated it becomes.

The icon, according to Dionysius, through the sensible forms of matter and through anthropomorphic figures, guides the believer towards intelligible and immaterial divine beings. Their symbolic and anagogic character of the icon indicated the weakness of the human intellect in approaching the supersensible essence of divinity, accustomed as it is to the sensible world. It is impossible for man to know God other than through sensible objects. This is the reason for which the accidental human shapes and symbols reveal and, at the same time, conceal the divine.<sup>28</sup> God is hidden in the transcendent nature of his essence, within his darkness (γνόφος). The sensible symbol is unable to have a complete correspondence with the divine; it lacks the power to represent it fully. It is a constant, but fruitless effort to approach the divine. On account of this, the symbol expresses absolutely the theology of Dionysius. As a being preeminently beyond affirmation and negation in the symbol, God is affirmed and negated at the same time.

From what has been said so far it follows that, for Dionysius, the icon, in becoming a finite symbol of the divine, undertakes the task of guiding<sup>29</sup> and elevating man to the divine through material shapes. This guidance, however, is difficult because all that the guide can do is to facilitate the wandering of our ignorance in search of the divine. The path taken is that of sensible figures,<sup>30</sup> but the divine remains inaccessible. Without the sensible form of the divine, the aforementioned guidance would be impossible. The form would be something indifferent, like the rest of the sensible shapes. That which intuitively leads towards the divine is its own presence.<sup>31</sup> In descending to the icon the divine consecrates it. The presence of the divine in the icon is similar to that of Jesus in the sacraments of the Church.<sup>32</sup> The worshipping character of the icon is sanctioned by its presence. As an imitation of the divine, the icon is ontologically dependent upon it. The divine descends<sup>33</sup> into the icon and the icon ascends to the divine. The believer's soul enters the domain of the divine symbolically and anagogically (συμβολικῶς and ἀναγωγικῶς)<sup>34</sup> through the icon. Thus, the icon constitutes a factual way for the soul to liberate itself from earthly things and to reach the domain of the divine.

Through the presence of the icon in its symbolic function, the fallen soul is delivered from the deceiving world of the senses and from sin, because it recognizes the divine<sup>35</sup> in the icon.

The unique and sacred character of the icon is grounded for Dionysius in

its function as revealing the beauty of divinity. The icon, in its symbolic function, does not constitute an arbitrary and accidental sign, but a metaphysical relation of the visible to the invisible divine, where the sensible form is indissoluble linked with the meaning and presence of the divine.

The positive evaluation of the significance of the icon, as presence and product of emanation from the *One*, the divine, from the point of view of Neoplatonism and Dionysius, seems to have persuaded the Fathers of the Greek Church to overcome the declared hostile attitude of the Old Testament towards icons. There is no doubt that Christology favored icon worship, especially the doctrine of the New Testament regarding the incarnated divine Logos. Through the incarnation of the son of God, the sensible and visible constitute the horizon, in which the invisible and the divine appear. In this way art is legitimated and the possibilities of its development are wide open in the Christian East and West.

The later Fathers of the Church have fully accepted Dionysius' universe. Icon worship finds in his person the most ardent supporter and apologist. Byzantine Churches and the Cathedrals in the West, influenced by the Neoplatonic and Dionysian doctrine, express magnificently the aesthetic climate of both doctrines. Through their tendency to elevation and attainment of power and internal lighting these Church buildings have become the icons of the intelligible and supra-intelligible world. In them we still hear the faint echo (ἀπήχημα) of a new Celestial Hierarchy.

## The Experience of Beauty in Plotinus and Aquinas: Some Similarities and Differences

Patrick Quinn

### Introduction

The similarities and differences in the writings of Plotinus and St. Thomas Aquinas on the experience of ultimate beauty specifically emerge when we compare Plotinus's account of his out-of-body experience in *Ennead IV.8.1* with St. Thomas Aquinas's attempts in *De Veritate 13.1* and *ST.II-II.175.1* to analyse St. Paul's experience of rapture described in *2 Corinthians 12.1-6*. The implications for human bodiliness is a feature of both approaches and concerns the way in which the out-of-body state in which ultimate beauty is experienced is said to affect the relationship between soul and body and to determine the kind of intellectual activity that can then take place. All this raises questions about what it is to be a human soul, to be a human body, and about how it would be possible to function cognitively in the absence of the body. As a Platonist, Plotinus typically wonders how he ever came to "descend" from his out-of-body state back down into one of human bodiliness characterised by discursive reasoning, whereas for Aquinas, as a self-proclaimed Aristotelian, what is important is to know how the human mind can function independently of the sensory faculties. This difference of emphasis suggests a much more fundamental opposition between the Platonist, Plotinus, and the Aristotelian, St. Thomas, which is characterised by the former's primary interest in a non-sensory based form of intellectual activity with all the implications that this has for the nature and destiny of the human soul, whereas, for Aquinas, what always remains important throughout is the bodily-based nature of human life and thought.

### The Platonic Context

Plotinus's description of his out-of-body experience in *Ennead IV.8.1* is shaped by his assumption that there is a psychic link between the changing corruptible and bodily world of appearance "here" and the unchanging immortal and spiritual realm of intelligible reality "There."<sup>1</sup> This is depicted in various ways in Plato's writings. In *The Symposium*, for example, we are told that love provides such a bonding. Diotima informs Socrates that divine love is "halfway between mortal and immortal" (202D), "a very powerful spirit, halfway between god and man." (202E). Love is a spirit of mediation, according to Diotima, and, like other such spirits, flies "upward with our worship and prayers, and (descends) with the heavenly answers and commandments" (202e). It forms part of the

medium of the prophetic arts, of the priestly rites of sacrifice, initiation, and incantation., of divination and of sorcery, for the divine will not mingle directly with the human, and it is only through the mediation of the spirit world that man can have any intercourse, whether waking or sleeping, with the gods. (*Symposium*, 202e-203a).

That there is a very definite religious aspect to such mediation is clear from the above passage and this is linked to mortality and immortality and to ignorance and wisdom.<sup>2</sup> In Plato's *Republic*, for example, the philosopher, who is metaphorically depicted in the Cave Allegory as the released prisoner, is vocationally obliged to mediate the vision of what lies beyond the darkness of the cave to those still trapped within (515c-519c). In this domain of "the in-between", the objective is always to transcend this world to what is beyond and this is described in Plato's *Phaedo* as the psychic journey of release from human bodiliness towards intelligible reality. The philosophic life facilitates this possibility by mediating what is beyond to those who live in the world of change and this is given central political importance in *The Republic* as a core value of the ideal society.

These ideas, which are typically reflected in those thinkers who came after Plato and were sympathetic to his views, are consequently found in Plotinus's writings where they are represented and reformulated but, perhaps, more importantly, are attested to in the form of a personal experience in Plotinus's own life. This is the real significance of what is set out in IV.8.1.

### Plotinus

Before considering his description of his out-of-body experience of beauty, it is worth recalling that Plotinus makes many references to the domain of the "in-between". The ability of the soul "to live by turns the life There, and the life here" (Enn.IV.8.4) is a frequent theme in Plotinus's writings, for example, in the following passage:

Since this nature is twofold, partly intelligible and partly perceptible, it is better for the soul to be in the intelligible, but all the same, since it has this kind of nature, it is necessarily bound to be able to participate in the perceptible... it occupies a middle rank among realities, belonging to that divine part but being on the lowest edge of the intelligible... (and has) a common boundary with the perceptible nature...(IV.8.7).

Plotinus describes a kind of split-level form of human existence in *Ennead III.4.2* characterised, on the one hand, by an involvement in the sensory and vegetative biological processes that pertain to animal and plant life accompanied, on the other hand, by a constant reaching towards "the upper world" of pure intelligibility. He remarks on the human tendency to indulge one's animality at the expense of the higher life. The majority of us occupy a position midway between animality and divinity, he states, which lies between the extremes of those who "become like gods and others like beasts." (Enn. III.2.8) This mixture that we are, enables us to remain in contact with the worlds above and below and defines each of us as an intelligible universe, according to Plotinus.<sup>3</sup> The following passage explains this point in more detail:

For the soul is many things, and all things, both the things above and the things below down to the limits of all life, and we are each one of us an intelligible universe, making contact with this lower world with the powers of the soul below, but with the intelligible world by its powers above and the powers of the universe; and we remain with all the rest of our intelligible part above, but by its ultimate fringe we are tied to the world below...(Enn. III.4.3).

This ability of the soul to remain linked to these two worlds denotes a psychic state of both equilibrium (Enn. IV.4.3) and tension and is reflected in a polarity of time and eternity, both of which we touch, moving up and down, as it were, between them (Enn. III.4.3). The tension is resolved when we are completely

removed from the bodily world and this is what occurs (if only paradoxically for a time) in the kind of out-of-body state described by Plotinus in *Ennead IV.8.1* and from which, perhaps understandably, he is reluctant to withdraw.

### Plotinus's Out-of-Body Experience

Plotinus describes his out-of-body experience as follows:

Many times it has happened: lifted out of the body into myself; becoming external to all other things and self-centred; beholding a marvellous beauty; then, more-than ever, assured of community with the loftiest order; enacting the noblest life, acquiring identity with the divine; stationing within it by having attained that activity; poised above whatsoever within the Intellectual is less than the Supreme: yet, there comes a moment of descent from interception to reasoning, and after that sojourn in the divine, I ask myself how it happens that I can now be descending, and how did the Soul ever enter into my body, the Soul which, even within my body, is the high thing it has shown itself to be (*Enn. IV.8.1*).

Plotinus finds support in the Platonic writings for his own views concerning these movements of ascent and descent respectively and gives some examples of texts where Plato approves of the former and disapproves of the latter. One such reference is to *The Republic* where the released prisoner in the Cave Allegory metaphorically represents the journey of the soul from the world here below to the transcendent realm of the ineffable above. Plotinus detects Plato's disapproval in the myth of the winged soul in *Phaedrus 246b et seq.* which has shed its wings (that would have enabled it to journey on high) and sinks down to earth, settling there to take to itself an earthy and mortal body. What is clear, if we are to believe Plotinus, is that he seems to have experienced out-of-body states more than once and these were characterised by an experience of ineffable beauty and divinity which, for some reason, ceased after some time. What is interesting about Plotinus's account of these extraordinary experiences is his matter of fact style of setting out what he believes has occurred and the brevity of the description of what transpired. This may be due to the limitations of language and to the sense of awe that such a vision might inspire.

In his treatise on Beauty, he describes the kind of context in which the vision of non-sensory beauty can be experienced:

These experiences must occur whenever there is contact with any sort of beautiful thing, wonder and a shock of delight and longing and passion and a happy excitement (*I.6.4*).

We must recognise our own inner beauty, he tells us (*Enn. I.6.5*) and cultivate the right kind of disposition through purification and self-control. "Greatness of soul", according to Plotinus, "is despising the things here; and wisdom is an intellectual activity which turns away from the things below and leads the soul to those above." (*Enn. I.6.6*) It is by ascending to what is good that we are led to the vision of beauty and leaving "all that is alien to the God" behind us, and can then see "with one's self alone" (*Enn. I.6.7*) Seeking the good necessarily means reaching the vision of primary beauty and the path to it involves a form of self-training where we become sensitive to all that is beautiful in life. We need to purify our vision and "concentrate (our) gaze and see". (*Enn. I.6.9*). Becoming good, God-like, and beautiful are identical processes for Plotinus.<sup>4</sup> Good and the primal beauty are on the same level and beauty exists in the intelligible world.<sup>5</sup>

The elegiac treatment of beauty in *Ennead I.6* echoes Plato's views in *Symposium* and *Phaedrus*, with the notable difference that Plotinus claims to have experienced what he describes. Separation from the bodily world is a precondition for such ultimate experience although for Plotinus, as a Platonist, the non-bodily dimension of such an encounter does not present any serious philosophical problems. For Aquinas, however, who also accepted the validity of out-of-body experiences of this kind, albeit in a limited number of cases, there are difficulties which must be addressed, given the Aristotelian position he is happy to adopt on the natural relationship between body and soul. It is to this view that we shall now turn.

### St. Thomas Aquinas on Out-of-Body Experiences

Aquinas's account of religious ecstasy is an attempt to analyse, from a philosophic point of view, the Pauline account set out in *2 Corinthians 12.1-6* which goes as follows:

I know a man still in Christ who, fourteen years ago, was caught up—whether still in the body or out of it, I do not know; God knows—right into the third heaven. I do know however, that this same person—whether in the body or out

of the body, I do not know; God knows — was caught up into paradise and heard things which Must not and cannot be put into human language

This extraordinary passage is taken by Aquinas to represent an actual description by St. Paul of a personal experience. Although no specific mention is made to the vision of God, Aquinas understands the Pauline event as a kind of limited beatific vision and, for our purposes here, it seems fair to say that this also would imply a vision of ultimate beauty.<sup>6</sup> St. Thomas's task is to try to philosophically explain how such an event could have occurred, given that, as a Christian Aristotelian, he is supposed to subscribe to the view that knowledge can only take place on the basis of a relationship between intellect and senses. The texts in which Aquinas's analysis is found are *De Veritate* Q13 and *Summa Theologica* II-II. Q175 and they are revealing in terms of the obstacles that confront St. Thomas when he tries to explain how such a noetic experience could occur.

### The Argument

Aquinas cites the authority of St. Augustine in support of his own belief that St. Paul actually had a vision of God during the experience described in 2 *Corinthians*.<sup>7</sup> However, Thomas is also aware of objections to the possibility of religious ecstasy, chief among which is the claim that human beings cannot act in a way that is contrary to their own nature.<sup>8</sup> He answers this latter objection by claiming that it is quite appropriate for human beings to be uplifted to divine reality since they are made in God's image and are therefore intellectually oriented towards God in any case although they require supernatural help to reach their goal. The same theme is pursued in *De Veritate* 13.1 where rapture or religious ecstasy is defined as a state of elevation contrary to nature.<sup>9</sup> What is interesting in both *De Veritate* 13.1 and *Summa Theologica* II-II.175.1 which deal with this issue is the underlying assumption of a subsistent human soul capable of functioning intelligently in partnership with the sensory powers or independently of them, as the case may be. This is an important point to note in the writings of Aquinas since it suggests that his Aristotelianism had to be supplemented with a contribution from Platonism on certain key issues, notably with regards to how the mind continues to function in the absence of any sensory input.<sup>10</sup> In fact, the Thomistic treatment of the Pauline experience is strikingly Platonic in certain key respects, as we shall see.

In *De Ver.* 13.1, Aquinas begins his main approach to the question of how it was possible for Paul to see God in life before death, by suggesting that, for this to happen, the human mind must be capable of transcending the physical limitations of everyday life where the intellect crucially depends on sensory experience. Indeed, in the state of rapture, the mind is able to focus its attention on intelligible realities because of something divine within us rather than because of any human disposition as such. Aquinas claims that Aristotle put forward such a view in *The Eudemian Ethics* VII.14.1248a although one might also argue that this is a very untypical Aristotelian position and represents Aristotle at his most Platonic. What is certainly true is that the claim that human beings possess an inner God-like disposition reflects a form of Platonism, and brings to mind the kind of cryptic remark attributed to Plotinus on his deathbed by Porphyry in his life of Plotinus.<sup>11</sup> The notion of divine illumination is also relevant here, as found in the writings of St. Augustine and later in Aquinas's own texts, especially where the latter puts forward his views on the kind of mechanism that operates during the mind's vision of God.<sup>12</sup>

Aquinas next proceeds (*De Ver.* 13.1) to make a distinction between this divine inner disposition and sensory activity, stating that the latter does not specifically pertain to being human as such but is something shared between humans and animals. Compared with the transcendent impulse of the mind to seek out intelligible reality, the ability to grasp what is sensory is merely a function of our animality, claims Aquinas. The impression here, once again echoing Plotinus, is of a split-level quality to human life, a boundary between the divine and human animality. The tension is between an immersion in physical life and bodily concerns, and a continuing advance towards the divine realm and the vision of God. As St. Thomas describes it later in *De Ver.* 13.3 & 4 there is a definite conflict of interests between the mind and the senses and a competitiveness between them that can only be resolved in favour of the intellect during rapture by excluding sensory activity altogether which is consequently suspended by divine intervention during the event. The victory of intellect over the sensory powers is crucial for this process to occur at all, according to St. Thomas. He was also aware of spurious forms of rapture that seemed to replicate religious ecstasy.<sup>13</sup> However, he argues that these deaden and stupefy the senses rather than enhance and elevate the individual. In fact, Aquinas regards rapture as a self-authenticating form of experience but this claim also has its own difficulties.

### Visio Dei in Rapture

One of the problems with regards to whether or not St. Paul could have seen God when enraptured relates to how it could ever be possible for any human being to experience the beatific vision before death. Although a number of quite formidable objections argue against the possibility of a Pauline vision of God before death,<sup>14</sup> it is clear from the *sed contra*'s of both *De Ver.* 13.2 and *ST.II-II.175.3* that Aquinas relies heavily on St. Augustine's authority to justify his own conviction that Paul had had such an experience. Aquinas explains his conclusion by comparing the temporary beatific state of St. Paul to a ray of sunlight that passes through the air and then departs although how he could maintain that the vision of God could function in such a way must remain questionable. If the mind is so engrossed in God and fixated on this ultimate objective (which one presumes must be the case in the beatific vision), then surely such an experience cannot be regarded as a passing phenomenon.<sup>15</sup> In any case, it does seem that Aquinas was satisfied enough with his own account in which he claims that some sort of mental withdrawal is necessary if rapture is to occur. On the one hand, he insists that this abstraction does not imply that the mind is wandering (*ST.II-II.175.1*) and, on the other hand, this state of withdrawal is not identical with the kind of separation of soul and body that signifies death (*ST.II-II.175.5*). Somewhere between these two extremes, the human intellect can somehow function in a state of rapture so that the sensory powers are present but suspended, so to speak, leaving the intellect free to operate at the highest level possible, under the extraordinary influence of God.<sup>16</sup> This, of course, echoes the kind of view put forward in Plato's *Phaedo* (e.g. 80c-81a).

St. Thomas begins his discussion in *De Ver.* 13.3 by claiming that the relationship between the mental and physical powers is such that intense activity on the part of the mind will correspondingly weaken the effect of sensory activities. It is like someone who is so engrossed in watching something that s/he cannot hear what is being said.<sup>17</sup> Rapture represents a state of imbalance where the mind's focus on God occurs at the expense of sensory activities:

But for the understanding to be raised up to the vision of the divine essence, the whole attention must be concentrated on this vision, since this is the most intensely intelligible object, and the understanding can reach it only by striving for it with total effort. Therefore, it is necessary to have complete abstraction from the bodily senses when the mind is raised to the vision of God (*De Ver.* 13.3).

It is typical of Aquinas's Platonism that he should use it in this way, namely, to explain how it is possible to function intelligently in the absence of the senses or, as in the case of rapture, where the sensory powers are seen to be a hindrance to the vision of God.<sup>18</sup> The kind of intense intellectual activity which is required for rapture means that a withdrawal from bodily and sensory activity is intrinsic to this experience, even though bodily existence still occurs.<sup>19</sup>

### Some Differences between Aquinas and Plotinus

One of the differences that we find in the Pauline account as compared with what Plotinus writes about his own experience is that Paul is not sure whether he was in an out-of-body state whereas Plotinus seems quite clear about what has occurred. Aquinas agrees that Paul is unsure and has argued earlier in *De Ver.* 13.3 *ad 4* that the vision of rapture does not occur in the memory which is linked to the sensory faculties, but rather takes place in the intellect itself since it is a purely intellectual activity wholly independent of any kind of sensory input. This explains why Paul had some difficulty knowing what precisely had happened to him when he "returned" to his natural way of knowing things, i.e. through sensory input, memory and imagination. Plotinus does not need to address this point since he seems to be confident that his soul could function intelligently in a separate way by itself "even when it is in the body" (in a mystic state, presumably), although the mechanism by which this could occur remains unclear (*Enn.* IV.8.1). Perhaps another difference lies in Aquinas's claim that authentic rapture can never be self-induced but is always involuntary and comes about by a special divine dispensation (*ST.II-II.175.1*). It is possible to argue that Plotinus's writings suggest that one could train oneself, so to speak, to acquire the correct disposition to recognise beauty in itself.<sup>20</sup> This is not a position that Aquinas could support since he regarded the attainment of the beatific vision as a gratuitous gift rather than an ultimate goal that becomes possible to achieve by following a certain path. This is the Thomistic (and Christian) view of grace assisting nature which proclaims that human beings can have access to the supernatural.

What both Plotinus and Aquinas certainly have in common on the subject of religious ecstasy is an approach based on Platonism but whereas this is clearly acknowledged in the writings of Plotinus, this it is not the case in the Thomistic texts.<sup>21</sup> Recent Thomistic scholarship, however, now recognises Aquinas's Platonism, while not denying the importance of his debt to Aristotle.<sup>22</sup>

This Platonism arrived from a variety of sources including Pseudo-Dionysius, Proclus and Islamic philosophers such as Avicenna and Averroes whose thinking was in certain important respects shaped by Neoplatonism.<sup>23</sup> Without acknowledging these influences, it is very difficult to understand why St. Thomas took the approach he did in his treatment of rapture since it seems to be so much at variance with his Aristotelianism. The fact is that when Aquinas was confronted with questions about how any form of knowledge can occur in the absence of the sensory powers, he came up against the limitations of Aristotelian theory and instead found in Platonism, solutions to problems that would otherwise remain largely unresolved, at least from a philosophic point of view. This is certainly true about significant aspects of his concept of mind.<sup>24</sup> Perhaps it is apt to conclude by referring to Inge's comment on this point in his work on Plotinus where he suggests that "Aquinas was much closer to Plotinus than to the real Aristotle."<sup>25</sup> What is certainly true is that St. Thomas's analysis of rapture is an important contribution to the literature on the subject on an area of experience with which Plotinus seems to have been personally so familiar.

2. Love is said to be "neither mortal nor immortal" (*Symp. 203e*) and "midway between ignorance and wisdom" (*Symp. 203e-204a*).
3. Cf. also Aquinas's concept of minor mundus in *II.Sent.d.1.q.2.a.3*.
4. "You must become first of all godlike and all beautiful if you intend to see God and beauty." (*Enn. I.6.9*).
5. *Ennead I.6.9*.
6. "Beauty and the beautiful - these are one and the same in God" *De Div. Nominibus iv.lect.5*, quoted in Thomas Gilby (transl.), *St. Thomas Aquinas Theological Texts*, Oxford University Press, London, 1955, 41.
7. Cf. *De Ver. 13.2* and *ST.II-II.175.3*.
8. Cf. the three objections cited in *ST.II-II.175.1*.
9. "Raptus id est contra naturam elevatum" (*De Ver. 13.1*).
10. I have dealt with the Platonism in Aquinas's thinking in my book, *Aquinas, Platonism and the Knowledge of God* and in "Reing on the Boundary: Aquinas's Metaphor for Subject and Psyche," in Karl Simms (ed.), *Ethics and the Subject*, Editions Rodopi B.V., Amsterdam, 1997, 165-172. Also cf. "The Interfacing Image of the Soul in the Writings of Aquinas," *Milltown Studies*, No.32, Autumn 1993, 70-75.
11. "Try to bring back the god in you to the divine in the All." Porphyry, "On the Life of Plotinus and the Order of his Books," in A.H. Armstrong (trans.), *Plotinus Vol.1*, Harvard University Press, Cambridge, Mass. & William Heinemann Ltd., London, 1966, 7.
12. See Vernon Bourke (ed.), *The Essential Augustine*, Hackett Publishing Company, Indianapolis, 1974, 97 and Aquinas's *Summa Contra Gentiles III.53* and *Summa Theologica I.89.1 ad 3*.
13. In *De Ver. 13.1*, he says that insanity can induce states of mind in which the intellect seems to be detached from the senses. The same is true for certain kinds of illness and he also cites demonic possession as bringing about conditions which simulate out-of-body states. Aquinas was also aware of the hallucinatory effects of certain herbs.
14. A number of objections in *De Ver. 13.2* relate to this point, specifically Objections 1, 3 and 4. These deny the possibility of a Pauline vision of God on the grounds that St. Paul's body was not glorified. The point here is that such an experience would have left long-term and clearly observable effects and would have had enhancing bodily consequences. Objections 2, 7 and 8 deny that Paul could have had some kind of temporary beatific vision. In *ST.II-II.175.3*, Objections 1 and 4 suggest that Paul must have imagined the event while Objection 2

bluntly states that if he had really seen God, he would never have returned to the unhappiness of this life.

15. Aquinas may have simply assumed that it is only in the incorruptible beatified bodies of the resurrection that *visio Dei* remains a permanent phenomenon whereas in the corruptible bodies prior to death, this was not possible. Cf. *ST.I-II.4.6 ad 3*. Also cf. Aquinas, *Platonism and the Knowledge of God*, 72-73 for more on this.
16. *De Ver.*13.3 & 4 and *ST.II-II.175.4 & 5*.
17. There are further echoes here of *Phaedo* 66b-67b.
18. Cf. Endnote 10 above.
19. There are some interesting questions here in relation to Aquinas's analysis of bodily resurrection. Cf. *ST.I II.4.5 & 6*. Also, Aquinas, *Platonism and the Knowledge of God*, 77-78, 81-90.
20. Cf. *Enn.*VI.6.6,7 & 8.

## The Sense of Beauty (κάλλος) in Proclus the Neoplatonist

Christos Terezis and  
Kalomoira Polychronopoulou

### I. Introduction

In the whole framework of Proclus' attempt to explain the way in which the metaphysical and natural world exist and function, description and interpretation are used as methodological instruments. His aim is to formulate a theoretical system which is not based merely on scientific analysis and research, but also —or perhaps mainly— on interpretative approaches. As a true metaphysician he is not thoroughly satisfied with cognitive schemata which are introduced by the scientific logos, although he respects and uses them. He believes that the scientific logos does not constitute a sufficient grounding for those presuppositions, which when interpreted could satisfy a consciousness that does not remain at the same level of perceptive facts. Of course he recognizes the necessity of such a rational description, but he mainly argues for a transcendental reality, which makes this consciousness possible and provides it with its final and substantial meaning. It concerns that entity, which is at the same time the primeval and the final cause of the world.<sup>1</sup> The main factor of Proclus' vision is beauty, as a fundamental and not as an acquired element of beings. Proclus elaborates on this issue in many of his discourses and mainly in his comments on Plato's *Timaeus* (Τίμαιος). In that work he presents beauty as a means or a component which the creator gives to the created.<sup>2</sup> He briefly analyses the general principles of this gift in his commentary Plato's *Alcibiades I* (Ἀλκιβιάδης Α'). There he attempts to relate Aesthetics with Ethics and Ontology. The present paper focuses on the relationship between Ontology, Aesthetics and Ethics in Proclus.

## II.

First, Proclus maintains that every metaphysical entity which has order and symmetry, also comprises the qualities of justice (defined as equality) and beauty. For Proclus, beautiful entities possess these moral properties since the beginning of time. He also claims that entities which have equality also possess beauty. On the other hand, unequal entities are regarded by Proclus as non-symmetrical and ugly. Proclus further adds that such entities lack inner cohesion.<sup>3</sup> Furthermore, he attempts to describe the relation between the metaphysical and the natural world. According to Proclus, beauty is not ascribed to anything else but to the archetypical "form" (εἶδον), which has predominated over matter. So, if we approach matter in its original condition, then we realize that it is obscene and totally without beauty. Consequently, whenever "form" is dominated by matter, then according to Proclus, it has been governed by disgrace and lack of shape. This also means that the conditions of matter have been imposed upon it and the "form" exists now in a way similar to that of the matter which then in turn constitutes its reception place in the formation of the body. Therefore, "forms" don't exist in the condition they should exist from their own nature. So, the metaphysical archetypes lose their strength and are no longer able to accomplish their formative mission.<sup>4</sup>

It is also obvious that Proclus is a dualist in the sense that his system provides both an ontological account and evaluating criteria. Every body is comprised of shape which has been received from the "form" and by the matter, which has received the shape. So, the body becomes aesthetically significant only then, i.e. when the ontological purity and authenticity of the "form" destroys or transforms the disorder and the lack of restraint which is attributed to matter. Consequently, the natural world becomes a negative force when it fails to receive the abilities and perspectives provided by the "form". In addition he highlights the aesthetical dimension of the bodies through a peculiar combination of Platonism-Aristotelianism. This combination is consonant with his aesthetic theory. According to him matter adheres to the "form," either from the beginning, on the strength of its own nature or at a later stage. Matter cannot "form" a body on its own; on an aesthetic level it can be nothing but deprivation.<sup>5</sup>

Consequently, Proclus remarks that beauty is not only to be found in bodies, but also exists in the intellectual realm of human existence. In order for beauty to reveal its aesthetic value and potential in this area, it is absolutely necessary that some of the hierarchies and interventions mentioned above come

into force. So, beauty appears in the soul only when logical powers predominate over illogical ones. Human life has certain attributes which must be dominated by the power of logos and prudence in order for them to dismiss their ugliness and the disproportion. But the main reason why beauty exists in the soul is justice, because justice contains moderation, limit and perfection.<sup>6</sup> These three elements are given to the soul by justice. Apparently, what is implied here is that logical elements are alien to passions and instincts and that mental purity is gained only when man overcomes his animal nature. The beauty of the soul arises from a morally righteous life, which on the one hand provides true proportions in volition and action and on the other hand eliminates chaotic situations with regard to choice and behavior.

For Proclus, all those attributes which guarantee a logical organizing dimension of things do not differ from each other in the quality of their natural origins. They all reflect the natural and authentic state of those things which arise from a common ontological source. That can be ascertained not only by the close affinity and interrelation between the effects of the attributes mentioned above, but also by their range. Justice, for example, ensures analogy, harmony and unity, not only on the anthropological but also on the cosmological level. The creator used justice as his instrument and thus ensured the coherence to the cosmological function. In this way beauty became sensible.<sup>7</sup> This account leads us to assume that this Neoplatonic philosopher indirectly claims that there should be a holistic consideration of the things as far as their positive existence is concerned. Beauty needs in any case the three following presuppositions: a) natural state, b) precise coherence, c) an integrated effect. Similar presuppositions must be noticed on the other values as well.

Consequently, Proclus examines the issue of the question of whether beauty is by nature (φύσει) or by convention (θεσει). Thus posing the question of whether beauty is substantial or accidental. In other words does beauty exist *a priori* or is it formed *a posteriori*? Is it or is it not in relation to the attributes which have been set out by human understanding? Proclus remarks that if we accept the statement that it is by human by convention, then it means that it is proper (πρεπον) and perhaps that it derives from the human belief, that it is an opinion based on the criteria of a surface perception.<sup>8</sup> At this point there is a clear reference to an *a posteriori* subjectiveness or an idealism, whose criteria and origins are purely gnosiological. The thinking subject sets its presuppositions in anteriority to the object and defines it with its attributive determinations. Proclus rejects gnosiological anteriority and ontological relativism and so he believes that beauty is lovable on its own nature. For man beauty is

compulsively lovable. It can be noticed that there is a human inclination to show interest and to accept whatever provokes love and admiration. This inclination is not only noticeable in relation to authentic beauty. It is also noticeable in relation to the beauty of lowest ontological and aesthetical levels. This beauty, although it is bound up with images, also has the ability to motivate the human soul to admiration. And although it is not real, it is surprising as a phenomenon, because its depiction of divine beauty is sensible, *i.e.* visible.<sup>9</sup> At this point it is also obvious that Proclus reevaluates the world of experience, at least in relation to its authentic potentialities and their preconditions. But we should keep in mind that Proclus still believes in the unstable and changeable character of this world. He accepts that "appearances," up to a certain degree, are authentic reactions of "being." For Proclus, appearance is connected with those values which can cause genuine emotional reactions and movements in the human consciousness.

In the following stage of his argument Proclus attempts to support his viewpoint by an etymological analysis of the term of beauty. He further remarks that beauty is defined as that which attracts to itself, as that which attracts those who behold it and as that which is intrinsically loveable. Therefore, it is essential for man to express his interest in beauty because this is the only way to reach it aesthetically using the superior elements of his being or soul. The most genuine expression of man's inner nature is love, which firmly and with no deviation leads to the enjoyment of beauty.<sup>10</sup> Proclus believes that whatever is worthy of desire, is good and thus lovable. Consequently, the real good is the subject of real interest and love, namely it has the highest priority in the scale of ontology and in the scale of values.<sup>11</sup> Therefore, if beauty is particularly lovable as a phenomenon, this applies all the more so to the case of referring to what is genuinely beauty. Thus formulating some logical combinations, the philosopher observes that, if whatever is beautiful is particularly lovable then it is the object of human reference and if this object is decent then whatever is good is decent, too.<sup>12</sup> Of course the combination above is based on what Proclus considers as real facts. However, through this combination, beauty is given authentic ontological features, which stimulate the human inner nature to possess the virtue of fulfillment.

In addition, Proclus establishes a gradation from lower levels of beauty to higher ones. This of course follows the Platonic models and hierarchical principles. He remarks that we should be interested in beauty since in the first place it exists in the phenomena, in our actions, in our professional occupations, in the sciences and in our virtues. It is very important to consider all

these phenomena and activities not simply as such, but from the aesthetic point of view. The next step is the beauty of the mind and the highest point is divine beauty which is in itself beauty.<sup>13</sup> With such a grading it is clear that Aesthetics is not an autonomous theoretical discipline, but is to be viewed in relation to Ethics, Gnosiology and Ontology. In other words these three disciplines comprise Aesthetics as a fundamental and supplementary element.

In conclusion, it must be noted that Proclus insists on the distinction between beauty in itself and acquired beauty. By beholding beauty in itself we behold elements of the highest level. Beauty is good in itself. Beauty in itself is the cause of symmetry in the soul. Whenever symmetry exists in the soul, it ensures the predominance of the superior conditions over the inferior ones. The former ones are reforming and purifying conditions that provide the grounds for expiation.<sup>14</sup> It is the ground for the perfection and purity of the soul of the humans. So the anthropological issue acquires a highly aesthetic dimension as long as man has become a carrier of metaphysical principles or he has at least come closer to them.

### III. Conclusions

According to all we have examined above, we come to the three following confirmations:

I. When Proclus extends the beauty as a superior aesthetical category, he is not only referring to the existence of beings, but also to the way in which they exist. When he describes the metaphysical and the natural world with beauty as their substantial property, he reveals them as ontological systems, which are characterized by logical order and organization, from which anything, having to do with chaos and lack of rhythm is absent.

II. He emphasizes that the right aesthetical vision of beings presupposes the understanding of their special and profound quality. He therefore suggests an approach which will be raised to the substance of beings by exceeding the level of the phenomena. The question here deals not only with the identification of beauty, but also concerns the search for the way elements which express fullness are interrelated on their own or in combination to one another.

III. He believes that beauty has an authentic value, meaning that it is found in the level of the absolute. Beauty is not influenced by fortuitous or occasional events, but possesses an archetypical character. Its sources are in the metaphysical, from which it derives its definitions. By claiming that the

metaphysical beauty is the presupposition of the natural world the philosopher gives a positive attribute to the beings which exist in the world of experience. In this frame Plato is preserved. The natural world makes sense because it participates in the metaphysical world. The former world is not autonomous and it does not provide its conditions, in order to construct itself to a logical system.

Finally, we will try to give a definition of aesthetics based on the text of Proclus, which we have analyzed: Aesthetics is the theoretical branch, which transcends the world of "appearance" and tries to find the world of "being." It starts from the confirmation that there is an archetypal system of values, which is fixed and absolute, and so it offers the principles and the rules of perfection. He maintains that the metaphysical world is comprised of rules and therefore human consciousness is obliged, to adopt and use regulated schemata of thought and interpretation, so as to function aesthetically. This occurs not only when consciousness comprehends but also when it enjoys the metaphysical world itself and its results in the natural world. Consequently, aesthetical interpretation means searching and formulating rules which regulate, ontologically speaking, the composition of metaphysical and natural beings and, from a gnosiological point of view, giving to the human thought the strict criteria for understanding.

## Notes

## The Vigil of the One and Plotinian Iconoclasm<sup>1</sup>

Frederic M. Schroeder

### Introduction

In a dream, the dreamer sees himself as in a dream landscape. Yet the self that he sees is not himself as sentient subject, but himself as dream object, as one among the objects in the landscape of reverie. The suspension of the ego belongs to the pleasure of a dream. To understand this, we may engage in the following thought experiment. I have a daydream of travelling to Crete to see Knossos. When I in fact take that trip and go to visit Knossos, there will be many differences between the real life experience and the dream, most occasioned by the vagaries of ego awareness. I shall at the same time be thinking of whether there is time to catch the bus back to Rethymno, try to remember whether I left something at the hotel, or worry about a person or situation at home. In the daydream, all of these factors are missing, because the ego that is occupied with such things will have been suspended: only the dream image of myself, a part of the idyllic landscape, will make the journey.

Plotinus engages in the following experiment (5.8.10-11). He invites us to self-knowledge. If we are unable to see ourselves, perhaps a god will help us toward that vision:

Further, one of us, being unable to see himself, when he is possessed by that god brings his contemplation to the point of vision, and presents himself to his own mind and looks at a beautified image of himself; but then he dismisses the image, beautiful though it is, and comes to unity with himself, and, making no more separation, is one and all together with the god silently present, and is with

him as much as he wants to be and can be. But if he returns again to being two, while he remains pure he stays close to the god, so as to be present to him again in that other way if he turns again to him. (5.8.11.1-9).<sup>2</sup>

Bréhier comments that this passage is like a dream state in which the dreamer, half awake, is aware of his dream and wishes to re-enter it.<sup>3</sup> Gurtler, recalling Bréhier's dream comparison, remarks on the similarity of the experience described in this passage and the appreciation of Byzantine art, in which the viewer of the art is no mere spectator, but is himself absorbed into the community created by its inverse perspective, with the vanishing point behind him, interacting with the objects within it.<sup>4</sup> Presumably Gurtler sees a similarity between the Byzantine painting and the dream experience in the inclusion of the self as one among the objects of the icon. We notice in this passage that the self seen in the state of consciousness that precedes total loss of self-consciousness is an image, an image rendered preternaturally beautiful. That icon of the self must be iconoclastically dismissed before union with the ground of the empirical self is achieved.

In fact, Plotinus does not accord to dreaming the positive role that Bréhier's use of it might suggest. He does use dreaming to illustrate the relationship between our ordinary waking consciousness, as a dream, and noetic awareness, which is an awakening.<sup>5</sup> Nevertheless, when we make the necessary equation, our thought experiment about dreaming has its uses for our understanding of noetic consciousness in Plotinus.<sup>6</sup>

In the above passage, surely the god who helps the contemplative to self-knowledge is that contemplative's own higher self.<sup>7</sup> Yet that self has, as it were, an objective presence among the Forms (I shrink from introducing the subject-object distinction into this context, but wish only to suggest the absence of aesthetic awareness). Plotinus suggests that when we enter into union with that god, we have no awareness of the god as other. Indeed our consciousness transcends all duality, just as a healthy person need have no awareness of health, while a sick person will have an acute awareness of health (or its absence) (5.8.11.24-33).

Where the experience of waking consciousness can, in Plotinus' description in 5.8.11, resemble what we would think of as a dream experience, what is for Plotinus a lapse into the dream world of sense might seem to us like waking up:

Many times it has happened: lifted out of [awakened out of (ἐγείρομενος)] the body into myself; becoming external to all other things and self-centred; beholding a marvellous beauty; then, more than ever, assured of community with the loftiest order; enacting the noblest life, acquiring identity with the divine; stationing within It by having attained that activity; poised above whatsoever within the Intellectual is less than the Supreme; yet, there comes the moment of descent from intellection to reasoning, and after that sojourn in the divine, I ask myself how it happens that I can now be descending, and how did the Soul ever enter into my body, the Soul which, even within the body, is the high thing it has shown itself to be (4.8.1.1-11).<sup>8</sup>

Here Plotinus describes his waking consciousness of the world of Platonic Forms and his fall from that vigil into the sleep or dream of the world of sense.

Plotinus applies to wakefulness language that would apply well to the dream experience as we have explored it in our thought experiment:

If then he [the One] did not come into being, but his activity was always and a something like being awake, when the waker was not someone else, a wakefulness and a thought transcending thought which exists always, then he is as he woke himself to be (ἔστιν οὕτως, ὥς ἐγρηγόρησεν). But his waking transcends substance and intellect and intelligent life; but these are himself. (6.8.16.30-35).

Here the awakener and the awakened are one and the same, the self does not exist apart from the experience of waking. There is a total absence of distraction. The vigil of the One, of course, would be the summit of wakefulness.

Plotinus encounters a difficulty in explaining how the soul, which is by nature impassive, can be affected by passions (3.6.5). The source of the affections is not in the external world, but in the soul itself. If the soul turns from the world of sense to the higher world of Forms, it will be free of affections just from this new orientation. The process is compared to an awakening in which the soul realizes that it is itself that generates the images in its dreams and at that moment is awakened:

It is as if someone who wanted to take away the mental pictures seen in dreams (τὰς τῶν ὀνειράτων φαντασίας ἀναιρῆναι) were to bring the soul which was picturing them to wakefulness (ἐν ἐγρηγόρσει), if he said that the soul had caused the affections, meaning that the visions as if from outside were the affections of the soul (3.6.5.10-13).

In the experience of awakening, the dream images are abolished. This awakening of the soul demands a purification. However, the purification is not simply a freedom from the body, but a fundamental change in the soul's attitude:

The purification would be leaving it alone (καταλιπεῖν μόνην), and not with others, or not looking at something else or, again, having opinions which do not belong to it—whatever is the character of the opinions, or the affections, as has been said—and not seeing the images (μήτε ὁρᾶν τὰ εἰδωλά) nor constructing affections out of them (3.6.5.15-19).

We should notice here, for the sake of the rest of our argument, the association of the word "alone" (μόνην) with the dismissal of images. For the soul to be "alone" is to be free of images.

### Background in Plotinus' Rhetorical use of Imagery

Everyone knows that Plotinus makes an abundant and compelling use of images. Let us consider a rhetorical (as opposed to philosophical) use of imagination.<sup>9</sup> Marcus Aurelius makes a use of imagery designed to overcome passion (*Meditations* 4.32). The disciple is invited to an act of imagination in which he summons before his mind the court of Vespasian and all of its intrigues. He then is further invited to reflect that Vespasian and all of his court are now dead. The effect of this meditation is to create an affective displacement. As he returns to his own world, the objects of his hatred or envy will no longer arouse his passions. Engagement with one's own passions is replaced by engagement of the mind and soul with the image of Vespasian and his court. That engagement induces a detachment from one's own passions. Plotinus makes a similar use of imagery in ethical contexts.<sup>10</sup> He makes use of a rhetorical, as opposed to a philosophical, use of imagination.<sup>11</sup>

Observing the conventions of negative theology, Plotinus will advance an image of intelligible reality, only to subtract from it those features which would suggest that it is corporeal. Thus in 6.4.7, Plotinus, to demonstrate the omnipresence of Soul, advances the image of a transparent sphere containing a luminous centre. The centre of the sphere illumines the circumference without itself being divided over the surface that it illumines. Then Plotinus asks us to subtract the corporeal nature of the luminous source to avoid the associations of corporeality.

Then Plotinus, having generated the image of the sphere, puts it to another use:

Suppose that someone took away the bulk of the body but kept the power of the light, would you still say that the light was somewhere, or would it be equally present over the whole outer sphere? You will no longer rest in your thought on the place where it was before, and you will not any more say where it comes from or where it is going, but you will be puzzled and put in amazement when, fixing your gaze now here and now there in the spherical body, you yourself perceive the light (6.4.7.32-9).

Now we are seeing the omnipresence of the Soul, not as objective observers, from without, but from within. The image, which was meant to serve the purposes of discursive thought, has now become a contemplative instrument. It has something of the character of a Iamblicean *sunthêma*.<sup>12</sup> What was intended to serve the purposes of negative theology has become a means of purification and affective displacement as the image is advanced and withdrawn.

Plotinus argues against the sceptical position that self-knowledge must lead to infinite regress (5.3.6). If mind consists of a knowing part and a known part, then the knowing part must know itself as knowing part and subdivide again. This process leads to infinite regress. Yet discursive thought (διάνοια) means to think through or by means of Intellect (διὰ νοῦ) and in Intellect there is no division between knower and known. Now apodeictic argument will have necessity (ἀνάγκη), but it will lack persuasion (πειθώ). Yet if we become truly conscious of the iconic nature of our own thought, we will transcend discursive thought and enter into union with Intellect. By bringing the operations of the discursive mind to awareness and gaining detachment from them, we become engaged in noetic awareness. In that state, since we no longer think discursively, but noetically, we will be persuaded of the truth of a discursive argument no longer even part of our awareness. Persuasion and necessity will have joined hands. The image of our own intellection has served as a vehicle of transcendence and union. This persuasion is verbal. Yet it consists in an *ekphrasis* of an image already advanced by reason.

### Imagination, Perspective, and Iconoclasm

In 5.8.9 Plotinus asks us first to imagine<sup>13</sup> that the universe is set inside a transparent sphere and then to subtract from the sphere its corporeal mass and

all sense of place. Plotinus urges us to invoke the god who created that of which we have a mental picture:

And may he come, bringing his own universe with him, with all the gods within him, he who is one and all, and each god is all the gods coming together into one; they are different in their powers, but by that one manifold power they are all one; or rather, the one god is all; for he does not fail if all become what he is; they are all together and each one again apart in a position without separation, possessing no perceptible shape—for if they did, one would be in one place and one in another, and each would be no longer be all in himself—nor does each god have parts different from himself, nor is each whole like a power cut up which is as large as the measure of its parts. (5.8.9.14-24).

In late antique and early medieval art, the vanishing point is located behind the spectator, rather than in the painting itself, so that perspective is measured, not from the viewer, but from the central figure in the piece. The picture provides an aerial view of the scene in which all the objects are encompassed within their own world. The effect of this is to include or enclose the spectator within the horizon of the painting and among its objects. By contrast, in the art of the Renaissance, the vanishing point is located in the painting, so that the spectator has an "objective" view of the scene and stands outside it. The late antique and early medieval perspective is known to art historians as the natural perspective, the perspective of Renaissance art as the artificial perspective.<sup>14</sup>

Grabar argues that the natural perspective represents Plotinus' view of visual perception.<sup>15</sup> Gurtler finds a text that better supports Grabar's position than the ones that he advances:

But as it is, the whole object is seen, and all those who are in the air see it, from the front and sideways, from far and near, and from the back, as long as their line of sight is not blocked; so that each part of the air contains the whole seen object, the face for instance; but this is not a bodily affection, but is brought about by higher necessities of the soul belonging to a single living being in sympathy with itself (4.5.3.32-38).

Gurtler remarks:

Plotinus is actually arguing that sight is not some affection in the air that presents us with an image that is like a picture in the classical renaissance perspective, with everything plotted out in a geometric grid to indicate relative distance

and size. Rather, sight sees the whole object, but from the object's point of view. That is, as wholly visible from any vantage point. Or, more precisely, both object and observer are seen or seen from any possible perspective because they are both involved in a living being much greater, the universe as a whole. Thus, one cannot have the situation of classical renaissance perspective with subject and object frozen in time and space as if in a photograph. For Plotinus, the subject cannot be a mere observer, but must be involved in their very environment he perceives, and the object, on the other hand, cannot be a mere datum of perception, but must constitute with the subject the perceivable world.<sup>16</sup>

In the image of the sphere in 5.8.9, Plotinus is presenting us with a noetic universe in which there is no fixed point of observation: all is transparent to all. In another passage, Plotinus shows the theurgic purpose of art:

And I think that the wise men of old, who made temples and statues in the wish that the gods should be present to them, looking to the nature of the All, had in mind that the nature of soul is everywhere easy to attract, but that if someone were to construct something sympathetic to it and able to receive a part of it, it would of all things receive soul most easily. That which is sympathetic to it is what imitates it in some way, like a mirror able to catch [the reflection of] a form. (4.3.11.1-8).

Gurtler remarks on "the explicit character of the complex of temple and statues as a microcosm, a miniature of the sensible world that focuses the presence of the divine."<sup>17</sup> We can only think that it is a sensible image of the noetic sphere of 5.8.9. In this passage, as in 5.8.9, the image contains the seeds of its own destruction, even as it realizes its anagogical purpose. Both the temple and the human mind reflect intelligible beauty, *i.e.*, the relationship is vertical as well as horizontal (if we must use spatial metaphors). Thus the end of the temple is to make the human mind reflect the intelligible beauty that it itself reflects, thus introducing its own obsolescence. The very presence of the divine that the sensible beauty of the temple summons induces the absence or vanishing of the image. That the temple and statue complex forms, together with the human observer, a community effects the transition to the world of noetic awareness in which there is no fixed point of observation and the community is created by the continual establishment of the vanishing point behind the spectator. In another passage, 4.3.9.29-38, Plotinus compares Soul in its creation of the sensible world to an architect:

There came into being something like a beautiful and richly various house which was not cut off from its builder, but he did not give it a share in himself either; he considered it all, everywhere, worth a care which conduces to its very being and excellence (as far as it can participate in being) but does him no harm in his presiding over it, for he rules it while abiding (μένων) above. It is in this sort of way that it is ensouled: it has a soul which does not belong to it, but is present to it; it is mastered, not the master, possessed, not possessor. The universe lies in soul which bears it up, and nothing is without a share of soul.

The house, then, is in the architect and the world is in the Soul that creates it. If we interpret 4.3.11 in the light of this passage, we may see that, while Plotinus says that the gods are present to the complex of temples and statues, it is really they that are in the gods, i.e., the gods are their place. The divine is the place which contains both the art and ourselves and our experience of the art is one in which the angle of vision and distance are measured from the divine and not ourselves. If I may return to the dream image with which I began, our presence in the visionary landscape is, not that of a sentient subject, but of an objective dream figure contained by the landscape itself.

Plotinus always uses art in metaphor and never addresses the subject directly. The reason is that the object of art has its place in the divine and vanishes into the luminosity that contains it. Plotinus illustrates the soul's vision of the One:

Like a man who enters into the sanctuary and leaves behind the statues in the outer shrine; these become again the first things he looks at when he comes out of the sanctuary, after his contemplation within and intercourse there, not with a statue or image but with the Divine itself (οὐκ ἄγαλμα οὐδὲ εἰκόνα, ἀλλὰ αὐτό); they are secondary objects of contemplation. But that other, perhaps, was not a contemplation, but another kind of seeing (οὐ θέαμα, ἀλλὰ ἄλλος τρόπος τοῦ ἰδεῖν) (6.9.11.17-23).

I have argued elsewhere<sup>18</sup> that by the phrase ἄλλος τρόπος τοῦ ἰδεῖν Plotinus means, not that our way of looking at things is altered by our experience of the One, but that perspective is measured from the One. The One is not one among the things that we see. Rather, it is the source of perspective for all the images of itself including ourselves. It is in the iconoclastic moment of abandoning all images that we may achieve *henôsis*.

Armstrong's translation of ἀρπάζειν at 4.3.11.7 as "catch" ("like a mirror able to catch [the reflection] of a form") is too mild and the supply of the

words "the reflection" attenuate the sense of the passage. The mirror is rather able to "rape form."<sup>19</sup> In the following chapter (4.3.12), the souls of men who see their images in the mirror of Dionysus are violently severed and plunged into the world of sense, presumably as the body of Dionysus is severed by the Titans in the Orphic myth. It is the genius of a mirror to be something other than what it is, water, silver, glass and mercury, etc. It is also its ability to receive colour and shape in real presence, rather than merely to be a representation. So the moments of presence and self-transcendence are, in the mirror, one and the same. For this reason, the mirror is a suitable symbol for the sacramental character of Plotinian art in its generation of the vanishing image.

Art then is for Plotinus sacramental. Now sacrament may function as a memorial, as exercising a symbolism appropriated to the uses of philosophical *paideia*, to educate intellect and emotion and lead them anagogically toward their proper objects. Yet it may also work *ex opere operato*, or objectively. It is in this latter sense that Plotinian art is sacrament. Why? Because the absence of aesthetic consciousness, of awareness of the other, is precisely the end of Plotinian contemplation.

### The Spiritual Director as Artist

It is crucial to understand that, while the natural perspective is to be found in Plotinus' theory of perception, he is not putting himself forward as a theorist of art, nor indeed is his primary interest in perception as such. The use that he makes of natural perspective is to overcome the distortions of sense perception so that we may learn the ways of noetic intuition. Art is of importance for Plotinus because of its anagogical character. The beauty of nature has the same transcendent purpose. The artist is both a producer and a breaker of images. So is nature. They both produce images of intelligible beauty that must dissolve if the soul is to transcend them.

I wish here to contend that that image and its withdrawal, in the grand analogy of art, nature, and spiritual direction, has a contemplative purpose apart from its demonstrative value in negative theology. In his own creation and destruction of images, Plotinus is every bit as much the artist as the sculptor, the painter, or the architect. The artist and nature are both dependent upon the vision of Form for their creations. So is it also with the spiritual director who by a rhetorical advancement and withdrawal of images leads his disciples from their engagement with sense, discursive reason, and passion to the fath-

omless beauty of the intelligible world. Plotinus states that the artist "goes back again to the wisdom of nature, according to which he has come into existence, a wisdom which is no longer composed of theorems, but is one thing as a whole." (5.8.5.4-6) Perhaps, we may surmise, the spiritual director is also the child of nature and our guidance back to the intelligible world a part of universal cosmic rhythm.

### Formless Form

In the *Treatise on Virtue*, Plotinus argues that the relationship of imitation that prevails between Form and particular is asymmetrical. The relation of similarity between two particulars is symmetrical. However, virtue in this world (civic virtue) imitates virtue in the intelligible world that is not virtue (1.2.2). When sensible reality imitates Form, it imitates that which is formless (καθ' ὅσον δὲ μεταλαμβάνει εἶδους, κατὰ τοσοῦτον ὁμοιοῦται ἀνειδέω ἐκείνῳ ὄντι, 21-2).<sup>20</sup>

When we think of the anagogical, mimetic, and erotic ascent recommended by Diotima in Plato's *Symposium*, we might imagine that we advance from one object of contemplation to another, until finally we come to the Form of Beauty as the final object of our ascent. We would be ever more conformed to something which is itself the perfect and defined version of the beautiful. However, for Plotinus the Form of Beauty is formless, while beautiful things are formed (6.7.32.6-9).<sup>21</sup> What this must mean is that, as we approach Beauty, we must ourselves become free of forms and images. The approach to Beauty is through a breaking of images and an iconoclasm. Thus in 5.8.11 the route to the intelligible world lies first in constructing, then in destroying, an image of oneself. We are familiar with that passage in Plato's *Republic* 509b9, so basic to the spirit of Neoplatonism, that declares that the Good is "beyond substance" (ἐπέκεινα τῆς οὐσίας). For Plotinus, the human soul must itself become "beyond substance" if it is to know the first principle (6.9.11.42).

### The Nocturne of the Soul and the Vigil of the One

The very formlessness of the One informs the restless eros of the soul. The soul cannot stay with the One, because of its very formlessness, of a lack of a place to stand:

What then could the One be, and what nature could it have? There is nothing surprising in its being difficult to say, when it is not even easy to say what Being or Form is; but we do have a knowledge based upon the Forms. But in proportion as the soul goes toward the formless, since it is utterly unable to comprehend it because it is not delimited and, so to speak, stamped by a richly varied stamp, it slides away and is afraid that it may have nothing at all (6.9.3.1-6).

The advent of the One is a mystery:

But one should not enquire whence it comes, for there is no "whence": for it does not really come or go away anywhere, but appears or does not appear. So, one must not chase after it, but wait quietly (ἡσυχῇ μένειν) till it appears, preparing oneself to contemplate it, as the eye awaits the rising of the sun; and the sun rising over the horizon (τοῦ ὀρίζοντος) ("from Ocean", the poets say) gives itself to the eyes to see (5.5.8.1-7).

When the nocturne of the soul is ended, to participate in the vigil of the One, to know its sunrise, is to dismiss all that would limit or define it. The horizon here is anything that would define or delimit (ὀρίζειν). As the One is the abyss of formlessness, it is only in this freedom from definition that we may know it.

The One creates while remaining what it is (μένοντος αὐτοῦ) (5.4.2.21-2) and Intellect, which proceeds from it, is an image (μίμημα καὶ εἶδωλον) of it (26). It is precisely a problem of this chapter how such an image can derive from the One while it remains what it is above all images (26-27).

We have seen earlier (3.6.5) that, in a discussion of purification, the word "alone" (μόνος) is associated with the soul's freedom from images. In a discussion of purification, Plotinus associates μόνος, "alone," with μένειν, "remain":

This is the soul's ugliness, not being pure and unmixed, like gold, but full of earthiness; if anyone takes the earthy stuff away the gold is left, and is beautiful, when it is singled out from (μονούμενος) other things and is alone by itself (συνῶν μόνῳ). In the same way the soul too, when it is separated from (μονούμενος) the lusts which it has through the body with which it consorted too much, and freed from its other affections, purged of what it gets from being embodied, when it abides alone (μείνασα μόνῃ) has put away all the ugliness which came from the other nature (1.6.5.50-58).

In its "remaining" or "waiting" the soul rehearses the creative activity of the One and thus returns to its source (as in 5.5.8.1-7 above). For the soul to re-

main alone is for it it dismiss all images so that it might become one with its source, itself free of all images and forms.<sup>22</sup>

The One, when it manifests itself, will not brook any limit we might impose upon it. It is this resistance to definitive argument or legitimized images which arouses the hatred of all positivists, dogmatists, or enemies of artistic abstraction to the vision of Neoplatonism. For the rest of us, the sense of undisclosed and continuing mystery, of the surplus of meaning, is what attracts us again and again to the pages of Plotinus and to art inspired by his philosophy.

## NOTES

1. By "iconoclasm" here I do not mean that Plotinus advocates the destruction of religious images. On the contrary, he finds them of the greatest value for the spiritual life. By "iconoclasm" I am referring simply to Plotinus' dismissal of intelligible images of his own creation.
2. With the exception of the passage from 4.8.1, all translations of Plotinus shall be from A. H. Armstrong, *Plotinus*, 7 vols. (London and Cambridge: Heinemann, 1966-88). Reference is to P. Henry and H.-R. Schwyzler, *Plotini Opera*, 3 vols. (Oxford: Oxford University Press, 1964-82).
3. E. Bréhier, *Plotin Ennéades*, vol. 5 (Paris: Les Belles Lettres, 1956) 123. Bréhier also notes that in lines 33-39, Plotinus offers a more rationalistic account of why we do not perceive ourselves.
4. G. M. Gurtler, "Plotinus and Byzantine Aesthetics," *The Modern Schoolman* 66 (1989) 275-283 at pp. 282-3.
5. 5.5.11.19-22; 3.6.5.1-13.
6. I am most grateful to Gregory Shaw who has permitted me to read his paper, "Dreamwork as Theurgy," who makes a similar use of dream imagery to understand Iamblichean theurgy.
7. In 5.8.10.43 the exercise is described as seeking the vision of the god in oneself.
8. Trans. Stephen MacKenna, *Plotinus, The Enneads*, third edition revised by B. S. Page (London: Faber and Faber, 1962). I have favoured this translation over Armstrong's because MacKenna brings out the sense implicit in Plotinus' use of participles that the soul is in a state of contemplation which is interrupted by the descent: Armstrong sees the moment of contemplation as an interruption of normal waking consciousness, cf. D. J. O'Meara, "A propos d'un témoignage sur l'expérience mystique chez Plotin," *Mnemosyne* 27, series 4 (1975) 238-44.
9. I pursue this theme in "Contemplation and the Contemplative Image in Plotinus," *Mediterranean Perspectives* (1998), 7-19.
10. Cf. 3.2.15.43-47; 3.2.15.56-62.

19. The verb has this violent sense unequivocally in 3.1.2.5; 3.2.8.19; 3.2.15.41. In 6.9.11.12 the soul, in its experience of the One, is ἀρπασθεῖς, arguably "carried off" (like Ganymede?). J. H. Sleeman and G. Poller, *Lexicon Plotinianum* (Leiden: Brill, 1980), col. 151 translate "plunder, carry away, catch." The translation as "catch" may be Armstrong's source.
20. Cf. C. D'Ancona Costa, "ΑΜΟΡΦΟΝ ΚΑΙ ΑΝΕΙΔΕΟΝ. Causalité des Formes et causalité de L'Un chez Plotin," *Revue de Philosophie Ancienne* 9 (1992), 69-113 and F. Regen, *Formlose Formen. Plotins Philosophie als Versuch, die Regressprobleme des Platonischen Parmenides zu lösen* (Göttingen: Vandenhoeck and Ruprecht in Göttingen, 1998) for the view that the formlessness of form responds to the introductory arguments of Plato's *Parmenides* by rendering Form unlike the particulars so that it is not confused with them.
21. Cf. D'Ancona Costa, 98.
22. In 1.6.7.9, the soul in its purification sees itself alone with the principle which is alone and freed from everything alien to itself (αὐτῶ μόνῳ μόνον); the soul which is free from form (μορφῇ) can receive the One, which is formless, 6.7.34.7-8) μόνῃ μόνον. Of course, we may also think of the famous words at the end of the *Enneads* as arranged by Porphyry: φυγὴ μόνου πρὸς μόνον (6.9.11.51).

## Neoplatonic Influences on Eastern Iconography: A Greek-rooted Tradition

Aphrodite Alexandrakis

In this short study, I will examine the tradition of Greek aesthetics in relation to religious iconography. I will begin by discussing some Platonic and Plotinian concepts, and proceed with a selection of certain early Christian theologians, who as iconophiles, had been influenced by Plotinus and Neoplatonism. I will not deal with Photius' theory for it is well known that he defended icons from an aesthetic point of view. I will defend the position that the iconophiles appealed to aesthetics and concepts that were rooted in the classical Greek tradition. Contrary to the iconophiles, however, the iconoclasts rejected icons by appealing to conservative religious beliefs.

Scholars have taken two opposing views regarding Plotinus: one side places him outside the Greek tradition, while the other identifies him as the mediator between Christianity and the classical world. I will side with, and attempt to provide evidence for, the latter view. My position will be based on Plotinus' own writings on images, which date back to Plato and the art of his time.

Throughout time, people have felt the desire and emotional need to be close to God, and this has led to the practice of creating images of deities. The practice of praying before a god's statue, for example, is an old custom which frequently appears in Herodotus, Euripides, and other Greek authors, and extends to the Greek novelist Heliodorus, third century A.D.<sup>1</sup> The Greco-Roman world tended to fuse the god and its image as if they were one, a tradition that formed the basis of image worship for Christianity. The Greeks, however, as lovers of beauty in addition to an emotional need for a god, possessed the need

of, and a special feeling for creating *beautiful* statues of their gods. Quintilian, for example, comments on Pheidias' statue of Zeus by saying that the majesty of this figure "is thought to have added something to the impressiveness of received religion; so exactly did the nobleness of that work represent the god."<sup>2</sup> Lucian also pointed out to the "overall beauty" of the same statue.

There are several examples in classical Greek sculpture in which "the visual qualities inherent in the concept of the God—lifting become manifest, and where the notion of pagan theology is applied to real works of art."<sup>3</sup> What was important in classical Greek sculpture was the rendering of (*morphe*:shape) *form*: the *form* of the gods was crucial to the making of a particular statue, although a few critics, like Xenophanes (sixth century B.C.) and later Heraclitus, were opposed to giving the gods any form at all. For example, in his *Elegy*, Xenophanes, admits that "it is proper for men who are enjoying themselves first of all to praise God," but he added that human beings shape god in their own image.<sup>4</sup> Thus, the gods appear with characteristic features of their human counterparts' races such as Aethiopian gods having snub noses and black hair, while Thracian gods have gray eyes and red hair.

With the exception of the above two criticisms, the Greco-Roman view of images remained dominant. There was almost an identification of the image with the god. But even during that time, there were some Iconoclasts. Xenophanes and Heraclitus have already been mentioned. In *The Battle of the Frogs and the Mice*, which is an ancient parody of the *Iliad* (178-87), but composed in the third century B.C., Athena complains to Saturn that mice have nibbled away her mantle...<sup>5</sup> This same mental picture of mice destroying the statue of a god from within, is also reflected in the Christian literature of the third century A.D. in which Arnobius says: "...do you not see the newts, mice, and cockroaches, which shun the light, build their nests and live under the hollow parts of these statues?..."<sup>6</sup> Thus, both Christianity and Paganism reacted to the same stimulus, but in a different way. The response, however, was the same: the creation of images. While for Paganism the causes of the natural images are the forms (shape), in Christianity the causes are concepts in the artist's mind.

These views in turn, lead to the question of how the Greeks approached the sacred image. M. Barasch suggests that two attitudes pertained to the statues of gods: "One tends to identify the image with the god, and the other denies any kind of relation between the two."<sup>7</sup> As for the concept of "image," it always existed in Greek culture, and there are various aspects to it. One is that the image (*eidolon*) can be seen, but cannot be touched, for it has no material

substance, but it does have form (shape), and its shape is an imitation of the person represented. Along these lines, Odysseus speaks to the "image" of his mother. Plato in the *Sophist* 236 a-c, refers to the artist who produces images (*teidola*), and that images are seen in the mirror, while reflections are seen in water (239c - 240a). Thus, Homer's and Plato's *eidola* are visible, they show the original figure, but lack material substance of their own. Hence, image had an existence of its own. Following Homer's idea of *eidola*, that images are visible, Plato enhanced the concept by adding the physical objects and phenomena. He does, however, make the distinction between a likeness (*eidolon*) which is a copy of the original, and a semblance (*fantastiki*) far removed from the original. And in the *Timaeus* (52c) he says that the image is like the real thing, but its existence is separate.

One tradition in Greek art and religion was the clothing of the god's statue. It appears in several places in Greek literature (*Iliad* VI, 311), and in the Parthenon's frieze of the great Panathenean procession. The Greek Orthodox parallelism to this is the Saint's clothing used as protection against evil. Another classical Greek religious tradition that was carried over to Christianity was the bathing of the god's statue. Plutarch informs us that the statue of Athena was bathed on the special days of *Plynteria*.<sup>8</sup> We learn from Pausanias that Aphrodite's statue was bathed in Sykion. We see the god's image being treated as if it were a living being, and the statues treated as animated. The Greek believer couldn't tell his god apart from the image (statue) he saw in the temple. As Barasch says: "Dion Chrysostomus, in the 12th Olympic Oration, takes it as a matter of course that we imagine the gods in the shape of the cult images we see around us . . . the artist determines how we will imagine the gods in our minds."<sup>9</sup> Thus, the statues and images were reminders of the gods, very much in the way that sensual objects are the copies and reminders of the Platonic Forms. The Platonic notion of "participation" therefore prevailed in the theory of images: the image "participates" in the figure it portrays. As known, the Platonic notion of "participation" (*methexis*) is used to describe the relationship between *eide* and sensible particulars (Phaedo 100d, Parm. 130c-131a). Later on, Proclus, in his "Elements of Theology," used the *methexis* metaphor in the Platonic sense.

The Platonic notion of *methexis* was also used as a defensive argument by the Iconophiles, maintaining the icon's *methexis* in the original Christ. On the other hand, the Iconoclasts saw "participation" solely as a metaphysical problem which was outside of sensual experience. For them, the viewing of an icon was not similar to seeing the original. Apart from the notion of "participa-

tion," when works of art, ■ sculpture for example, were involved in Greek religion, the idea of beauty was the most important standard, for it brought about the viewer's inspiration, guiding it towards religious and aesthetic contemplation. Thus aesthetic contemplation goes hand in hand with religious feeling. The sense of beauty that was deeply planted in Greek culture was therefore used as a means to inspire people with religious feelings. This deeply Greek-rooted tradition continued throughout the centuries and can even be experienced in the Byzantine icons of the Greek Orthodox church.

Naturally, a number of serious questions were raised by the Iconoclasts. Their criticism focused on the god and its image, stressing the impossibility of creating an image of god because God, they say, is imageless. But what does this mean? Does it mean that God cannot be seen, or that God doesn't have a human form? They also pointed to the issue of idol worship, as well as the material origin of the gods' statues, meaning that from the same material the artist can create other objects, making the image of the god a material (physical) object.

It is interesting to note that some of the classical era's criticisms of statues are similar to that of the Byzantine era. I tend to agree with L.W. Barnard that the Christian tradition was united with paganism and that Byzantium became "the bridge linking the Graeco-Roman world to the Europe of the Middle Ages."<sup>10</sup> There was no sharp distinction between the two worlds. The Christian Orthodox followers did not have to relinquish their classical learnings. Consequently, Iconoclasm was a challenge to this sense of continuity with the Graeco-Roman past. But did the worshippers of the pagan world think of the statues and images as being the gods themselves? To this question, an answer that represents the world of that time was given by the Emperor Julian who apostasised from Christianity and inaugurated the fourth century pagan revival: "...when we look at the images of the gods, let us not indeed think that they are stones or wood, but neither let us think that they are gods themselves...world."<sup>11</sup> The Christian Iconophiles' idea that the divine is present in the material image, and therefore the material nature is penetrated by the divine, is a belief supported in the use of icons.

Actually, this is an ancient idea found in Plutarch and Pythagoras,<sup>12</sup> and continued by Plotinus and the Neoplatonists. In fact, the Neoplatonist Iamblichus attributed to statues a miraculous origin, while for Proclus the statues were fit to receive divine illumination like gods.<sup>13</sup> Images (icons) were extensively used during the early centuries of Christendom, particularly in Constantinople. The images of Christ and of the Virgin were used to instill

courage in the troops during a battle. Also, images of Christ and the Virgin were carried around the walls of the city. Like the goddess Athena for the Athenians, the image of the Virgin Mary acquired a special position in Constantinople. As the city of classical Athens had become the center of culture and beauty, Constantinople was "the eye of the faith of the Christians."<sup>14</sup> Just as the Greeks believed in Athena's intervention for winning a particular war, so did the Greek Orthodox salvation from the Slavs, Persians, Arabs, and other invaders come from the icon of the Virgin. The Virgin's presence became magical in material objects and the icons were holy. Just like with Athena, "the icon became the visible expression of the invisible bond that linked the community with the intercession of its patron saint..."<sup>15</sup>

P.L.R. Brown's explanation of the rise of image culture on the basis of social and psychological reasons, in my opinion, is incomplete.<sup>16</sup> It leaves out the theological and aesthetic points of view. Brown points out that Iconoclastic debates did not happen for the sake of aesthetic experience or clarification of theological concepts. Rather, he says, they occurred because of political and social orders between radicals and conservatives.<sup>17</sup> While this may be true, one cannot ignore the classical Greek culture's influence, that is, the influence of the classical ancestors of Greek Christians. As mentioned, and as Hegel points out, the Greeks' religion was "a religion of beauty." Additionally, the notion of mimesis that Plato introduced was continued by Plotinus and the Neoplatonist Christians. In classical Greek culture it was important that objects, artistic or not, were rendered with an "aesthetic" approach, for they were conscious of the influence of beauty on the beholder, and consequently, beauty enhanced their religious belief through the making of the gods' statues. This Greek-rooted tradition is reflected in all Greek works of art, particularly in those of the fifth century B.C. idealistic sculptures. It is an "aesthetic" tradition that was inherited by the Byzantine Christians and was applied on the icon - making, thereby creating the aesthetic experience of icons. This means that certain qualities, or elements that make up the form (shape) of the image, have been used and painted in a certain way or style, so that they determine the character of the aesthetic experience. Some of these qualities are lines, shapes, colors, symmetry, harmony, and rhythm.

If one interprets aesthetic experience as a pure contemplation that leads nowhere beyond itself, then that kind of contemplation would not have influenced the icon viewer. Barasch notes that in the aesthetic approach the work of art must be considered in isolation from anything else and all by itself; this is called the "autonomy of art" and it follows that "to ask what essential features

the work of art has in common with what is outside it is to undermine its autonomy."<sup>18</sup> However true this may be, it does not affect the icon's impact on the spectator or believer, especially the person who could not read or write, but who could be inspired from a beautifully painted icon of the Virgin or Christ. It is certain aesthetic qualities within the design that will enhance the viewer's religious feeling. To the question of how does communication between the image and the worshipper take place, it has been suggested that this is done through "affinity."<sup>19</sup> The idea of "affinity" was explored by Plotinus in his treatise on "Problems of the Soul," but was first introduced by Plato's *Cratylus*. A "perfect" picture, Socrates says, will produce good communication. According to Plato, in contemplation there always exists an affinity to visual experience. This idea was enhanced by Neoplatonism, and visual experience was seen in a new light, and images were considered "the main roads to cognition." Affinity also explains the establishment of shrines and images. On this, Plotinus says:

...the wise men of old, who made temples and statues in the wish that the gods should be present to them, looking to the nature of the All, had in mind that the nature of soul is everywhere easy to attract, but that if someone were to construct something sympathetic to it and able to receive a part of it, it would of all things receive soul most easily. That which is sympathetic to it is what imitates it in some way, like a mirror able to catch [the reflection of] a form. ...For it was certainly not possible for the thing made to be without a share in the god, not again for the god to come down to the thing made.<sup>20</sup>

Plotinus therefore suggests visual similarity, *i.e.*, resemblance between the prototype and the copy. His followers believed that it was the statue's similarity to the god that makes the god inhabit it, and the god in turn animates the image, thereby building the affinity between the god and the artistic image. But affinity for Plotinus depends on the artist's giving a "sympathetic" feeling to the god's form. "Sympathy" is therefore Plotinus' answer to the god's dwelling in the image. We see then that for Plotinus, in order for a statue to fit the attraction of God, it must be a *good semblance*. Naturally, what is meant by a good semblance is also a beautiful semblance for gods were visualized as such. For Plotinus, human beings feel the need to be close to the god, and they achieve this through the creation of the divine image. This tradition of course continued in the making of icons in Byzantium.

Plotinus' use of many metaphors and images in his *Enneads* leads him to

use the term *icon* (image) repeatedly whenever he refers to a work of art. He distinguishes between mental images (dwell in soul) and a work of art, although both share common characteristics.<sup>21</sup> Images, he says, manifest "the non-discursiveness of the intelligible world."<sup>22</sup> We first think in images, and then we develop discursive thinking and knowledge. As a result, Plotinus perceives the chain of being or emanations as a chain of images. Thus the image of the Soul is Matter (*hyle*),<sup>23</sup> and the image of Intelligible Matter is Sensible matter. This "fusion" of god and its image into one form suggests that they are one. One feels close to god when one is near its image. Iamblichus, later followed Plotinus' teachings and added that images of gods can be filled with divine power and perform miracles. Images and names of gods share their "symbolic resemblance" to the gods;<sup>24</sup> icon, is a "likeness" or "reflection" of the god and the name and icon of the god are united in an "ineffable way" with the god itself. This concept of *eidolon* must have influenced the Greek artists in the carving and painting of their gods.

Since images were of concern to Plotinus, the aesthetic appearance of those images was also important to him. He spends a great deal of time on the notion of beauty in the universe, the soul, and of objects. He begins his *Ennead* 1.6 on *Beauty* by saying: "Beauty is mostly in sight, but it is to be found too in things we hear, in combinations of words and also in music..." Thus, we learn, contrary to Plato, that Plotinus appreciates the sense of sight. It is through sight that human beings come to appreciate the material universe which, for him, is good, beautiful, and was made by a divine power. The reason the world of sense is good and beautiful is because it is "a clear and noble image of the intelligible gods." And he adds:

But it is false to say that the image is unlike the original for an image of soul would have no sort of use for darkness or matter, but when it had come into being, if it did come into being, would correspond to its maker remain in close connection with it.<sup>25</sup>

Plotinus emphasizes that those who despise and hate the beauty of this world cannot know and love the beauty of the intelligible beauty.

While Plotinus recognizes, in a Platonic fashion, the inferiority of human arts' process against the divine, he, however says:

But if anyone despises the arts because they produce their works by imitating nature...natural things are imitations too. Then we must know that the arts do

not simply imitate what they see, but they run backup to the forming principles from where nature derives and since, they possess beauty, they make up what is defective in things."<sup>26</sup>

This Plotinian approach to art and imitation is reflected in the Christian making of the icon, for as mentioned, for Plotinus the material nature is penetrated and transformed by the divine in the images of gods.<sup>27</sup> Plotinus filled the gap between the celestial and terrestrial worlds with emanations, or the overflowing of light from the celestial source to the terrestrial through hierarchy. This opened the road for the Neoplatonists. Among the early defenders of the icons was the Neoplatonist John Damascus, whose defense was based on a theological formation combined with his interest in the arts. He defined *image*, icon, as grasped in reaction to its prototype. Image, he says,

is of like character with its prototype but with a certain difference. It is not like the archetype in every way... the original is the thing imaged from which the copy is made.<sup>28</sup>

And like a real Plotinian follower, he held that the image "is a likeness, or a model, or a figure of something, showing in itself what it depicts."<sup>29</sup>

The ancient view that the icon is identical to the prototype in form but not in substance was also inherited by the Greek church Fathers. In his book "Against the Arians" St Athanasius says:

If we use the example of the emperor's image we will find this (the deity of the Son who resembles the Father) easier to understand. This image bears his form and appearance...<sup>30</sup>

Like Damascus, and according to the Greek tradition, Athanasius' quotation implies the detachment of form from the matter into which it is imprinted. This of course is consistent with Plotinus saying: "The more matter loses its form, the closer it resembles its original model, the idea..." The image therefore imitates the prototype, and the essence of the icon is the portrayal of the prototype. Like Plato, Damascus suggests that the reality of the image is less authentic than the prototype. Consequently, Athanasius' image is the equivalent of the Platonic "appearance."<sup>31</sup>

All three (Plato, Plotinus and Damascus) stress the image's lack of reality and the notion of image as a copy, and this is consistent with the making of Byzantine icons. Damascus' denial of the image's full reality is of course a

reflection of Plato's theory of *mimesis*. The image (icon) created by the artist is an illusion and an appearance of the object devoid of the prototype's physical reality. Hence, the image for Damascus possesses less reality than what it portrays. His statement that "an image is a likeness showing in itself what it depicts," has occupied several scholars' minds. Did he mean that the image is an autonomous object? He knew that the model preceded the image and therefore it could not be autonomous. But as has been pointed out by Barash, "in the process of our grasping what is represented in the image, the image comes to enjoy an autonomy of sorts." In other words, in order for the viewer to understand what the image shows, he does not have to rely on something else, for the picture shows that "in itself." This is what we call in the 20th century "aesthetic experience" that is, the viewer's pure contemplation and absorption by the image. However, in the case of icons, contemplation is achieved through the *form* of the image which points to the prototype: the spiritual *form*. The icon therefore resembles the prototype in terms of *form* only.

Since the distinction between *icon* and *prototype* could lead to idolatry, Damascus insisted on this and said: "For the image is one thing and the thing depicted is another. One can always notice differences between them, since one is not the other, and vice versa."<sup>32</sup> Naturally, crucial questions of an ontological nature are involved here though they are beyond the scope of this paper.

As mentioned earlier, while Damascus and Athanasius' theories reflect Plato's theory of Forms they are also consistent with the ideas involved in the making of fifth century classical sculptures such as the Zeus of Artemision and the Charioteer of Delphi. These works represent idealized beauty and perfection of *form* (shape), reflecting its inner understanding and contemplation through elements such as shapes, lines, rhythm, harmony, symmetry, and a sense of grandeur.

According to Damascus, the image (icon) "reaches farther than the perception of the human eye in natural experience, it shows what lies beyond the realm of visual experience."<sup>33</sup> The icon reveals more than what can be seen in nature; it makes us "see" the invisible. And since it represents the invisible, its purpose is to attain this goal: "...when the Invisible One becomes visible to flesh, you may then draw a likeness of its form..."<sup>34</sup> Naturally, this involves the worshiper and the icon's impact on him or her, and this formed one of Plato's bases for rejecting art works. Consequently, while Damascus follows Plato on the definition of image, he simultaneously accepts divine images for the same reason that Plato rejects them: for while the imitation of the proto-

type, is an unnecessary act for Plato, for Damascus, and the Orthodox Fathers, it was absolutely necessary. And while icons in the eastern church were accepted for their effects on the worshiper, the western church rejected them on the claim that icons do not have an autonomous value. The Orthodox fathers held steadfastly that icons attain value because of their effect on the believers. These effects seem to be primarily aesthetic. The aesthetic effects were the result of the way the "form" was treated; particular lines, shapes, color, and a detached, aloof expression suggesting immateriality and "otherness." Even the sixth century Pope Gregory the Great's notion of icons as didactic implements must have some aesthetic qualities in order to be able to function as such, that is, to teach people something through the inspiration of their aesthetic qualities.

It has been pointed out that the concept of images as embellishments of sacred objects is absent from Damascus, and that although he defended painted images, he had no appreciation for artistic imagination and workmanship.<sup>35</sup> In my opinion, the fact that Damascus did not use images as an embellishment of sacred objects, does not necessarily mean or support the claim that he had no appreciation for artistic imagination and workmanship. Let us not forget the political danger involved in this issue. Moreover, just because in his *Hymn to the Icon*, he does not mention any aspect or feature of the icon or make a reference to workmanship, does not necessarily support the claim that he was not interested in the icon from the artistic point of view. In his *Hymn* he says:

The icon is a hymn to triumph, a manifestation, a memorial inscribed for those who have fought and conquered, humbling the demons and putting them to flight.<sup>36</sup>

The absence of a reference by Damascus to any artistic (aesthetic) qualities is not in disagreement with his saying that the icon is "a hymn of triumph." Such a hymn does not have to necessarily state any particular aesthetic qualities; but does this mean their exclusion? It is important to remember that Damascus made the distinction between an idol and an icon. Confusion of the two would have led to accusations of idolatry. Finally, Damascus' defense of the icon was based on the incarnation of Christ. Even though he asks questions that remind us of the physical portrayal of the Infinite, he supports the idea of icon and never answers these questions.<sup>37</sup>

Whether Damascus admitted that the artistic (aesthetic) component of the icon strengthened the believers' faith is up to his readers to decide. There

may have been political, theological, and or social reasons for not doing so, but as we saw, his emphasis was on the icon's impression and influence on the worshiper. There are other theologians, not to mention Photius, who were also openly defending the icon's artistic influence on the believers. One such was Theodore of Stoudion. Consistent with the Greek tradition, Theodore, like Damascus, used Homeric and Platonic terms such as *eidos* meaning "appearance," implying *eidos* is not an idea in the artist's imagination, but a completed visible image. Another term he uses is *morphe*, meaning "form."<sup>38</sup> The Platonic *schema* appears again in Theodore's discussion of images as well as the term "character" referring to the icon as being a faithful rendering of the prototype. On this he says: "Is not every image a kind of seal and impression bearing itself the proper appearance of that after which it is named?"<sup>39</sup>

On the basis of the above, the icon and the prototype can be said to have several real elements in common. One of these is "form." According to Theodore, and the Iconophiles generally, "form" is present in both the mental image and the painted icon. For Theodore, the distinction between these two was the separation between "pure form" and a work of vision; that is, the shape, form, has an ideal existence only. Shape can be materialized by being painted or carved. Hence, the existence of "pure form" detached from any specific matter. Like Plotinus, Aristotle,<sup>40</sup> and Damascus, Theodore emphasizes the importance of the sense of sight. Even the Patriarch of Constantinople Nicephorus held that sight is above all other senses.

To sum up, the Greeks' "religion of beauty, and superb understanding of the "aesthetic" rooted back in the archaic period (sixth century B.C.), and reaching its peak in the first quarter of the fifth century idealized classical period, continued its tradition through Plotinus and the Neoplatonists in the Greek Orthodox church of Byzantium. The icons convey the Lord's message just like bells convey it with sound. The more aesthetically the icon is rendered, the stronger its impact on the believer (spectator). And, again, as Plotinus said: "...the arts...run back to the forming principles...they possess beauty..." (*Enn.* IV.3.11).

## The Neoplatonic Tradition in the Art of El Greco

Robert Meredith Helm

Dominikos Theotokopoulos was a native of Candia, the capital of the island of Crete, which since 1204 had been a possession of the Serene Republic of Venice and which accommodated a substantial number of Venetians among its inhabitants. Virtually nothing is known of his early years, and even the date of his birth, probably in the year 1542, is uncertain. From the apparent depth and scope of his education, it appears that he was a member of a family of some standing, but the earliest documented reference to him that survived is an instrument signed before a notary public in 1561 by Maistro Menegos Theotokopoulos Sgourafos (Toledo Museum 15). Toward the end of that year, he offered one of his paintings for sale in a lottery. This sketchy information is all we know of his life in his native Crete.

We next hear of him in Venice, where there was a sizeable colony of Cretans. On August 18, 1658, he was making arrangements to dispatch drawings to a Candian cartographer. Two years later, he had moved on southward. A letter from John Clovis, a miniaturist, to Alessandro Farnese, written on November 15, 1570, says, "There has arrived in Rome a young man from Candia, a pupil of Titian, who, I think, is a painter of rare talent. ... He has painted a portrait of himself which is admired by all the painters in Rome. I should like him to be under the patronage of your reverend lordship without any other contribution towards his living than a room in the Farnese Palace" (*Encyclopaedia Britannica*, v. 22, 69).

Venice was a cultural link between East and West, and the art of that city at the time of the young Greek's residence there incorporated something of the spirit that would characterize the Greek's developing style. Titian, at that time

in his nineties, and the grand old man of Venetian art, was a principal source of the style of painting that Theotokopoulos was to follow throughout the years of his residence in Italy. He was also strongly influenced by Tintoretto, Veronese, and Giacompo Bassano.

Non-Venetian sources of his Italian style are evident as well. Raphael's *The Healing of the Lame Man in the Temple*, also known as *Peter and John at the Beautiful Gate*, clearly provided some material for Theotokopoulos' small painting, *The Purification of the Temple*. Executed in tempera and staged in an architectural setting representing a hodgepodge of the tricks of perspective popular at that time, it shows Raphael's influence on some of the figures in the young Greek's painting, notably those of a woman and a little naked boy bringing their offering to the temple.

More significant for an understanding of El Greco is the fact that his works of the Venetian and Roman period, conforming in many respects to the prevailing Italian Renaissance style, nevertheless give hints of an earlier influence one that was later to reassert itself powerfully in the masterpieces that would establish the unique place he occupies in the history of art.

At about the age of thirty, having already attained some fame as an artist, Theotokopoulos left Rome. The reasons for his departure are somewhat obscure, but a story told by a seventeenth-century writer, G. Mancini, may shed some light on the matter. According to Mancini, the Greek was given the opportunity of becoming the breeches maker for the figures that Pope Pius considered indecent in Michelangelo's *Last Judgment* in the Sistine Chapel. Theotokopoulos suggested that it might have been better if the whole painting had been cast to the ground so that he himself might have done it with sincerity, decency, and artistic integrity. There seems little reason to doubt that such an insult to the foremost artist of the age may have raised the temperature of Rome to a point where he thought it advisable to find another place to live and practice his art.

Why he chose Spain is not known. It may have been because Philip II was building the Escorial and looking for artists to decorate it. At any rate, his choice turned out to be a felicitous one. He was obviously struck by the stark Spanish landscapes and he promptly began to incorporate in his paintings the clean and dramatic colors he found there, which must have reminded him more of those of his native Crete than of the lasher hues of Italy.

We find him in Toledo in 1577, completing a set of paintings for the rebuilt Church of Santo Domingo el Antiguo. Those works enhanced his already great reputation, and he was commissioned by the Chapter of Toledo

Cathedral to paint a picture for the Sacristy. The result was *The Stripping of Christ before the Crucifixion*, in which the essential elements of the altered style that would ultimately be dominant in his work were clearly evident.

Controversy about certain aspects of the painting and a dispute over his compensation entangled him for some time after its completion, but it must have impressed King Philip, for he asked Theotokopoulos to paint an altarpiece for his church in the Escorial.

El Greco, to use the name by which he must have been generally known by that time, responded to the monarch's request with the painting of *St. Maurice and the Theban Legion*, depicting the mass martyrdom of a body of third-century Roman soldiers who refused to obey orders to persecute their fellow Christians. He portrayed the event, not in the expected Spanish mode, with emphasis on the horror of the beheading, but in a way that demonstrated that he was not entirely hostile to the style known as *Maniera*, or High Mannerism, based on the paintings of Raphael and Michelangelo, but emphasizing artistic form over dramatic content. El Greco chose to place at the center of his painting an elegant Maurice, with members of his staff and a little armor-bearer, conferring courteously with an official about their impending execution and that of their comrades of the legion, who are seen in the distance lining up to have their heads cut off, a procedure which is already under way in matter-of-fact fashion, with no indication of ill feeling on either side. Meanwhile, the heavens above are an integral part of the scene, filled with a host of celestial beings preparing a reception for the prospective arrivals. Despite the religious propriety of the theme, the style so irritated Philip that he refused to have the painting installed over the altar, though it remained at the Escorial.

Quite undeterred by royal disapproval, the Greek went on with his painting, gradually developing a mode of artistic expression that eschewed earthly realism in favor of an embodiment of a philosophical and religious outlook that regarded the material world not as something ultimate in its own right, but rather as an expression of a transcendent spiritual reality.

The juxtaposition of the earthly and the heavenly became a frequent theme in El Greco's paintings. His colors, were borrowed less and less from the Venetian and Roman masters, taking on colder blues, greens, and steely grays, with accents of white, yellow, green, and wine red. All the time, his figures were becoming increasingly more sinuous and elongated, possibly owing something to such Italian painters as Tintoretto and Parmigianino, but clearly expressing something so significant for El Greco that it subordinated the influence of painterly convention to religious and philosophical influences more

important to him than the more mundane concerns money, high living, romance, controversy, and the like that had their place in the other side of the balance of his complex nature. Those more spiritual and scholarly aspects of his character were fueled by a way of life marked by a thirst for books and an appreciation of good conversation with the *intelligentsia* of Toledo, with whom he was on the best of terms. One of those companions wrote of him, He was a great philosopher (Byron and Rice 183).

A thoroughly typical expression of the sort of art that ultimately became such a powerful vehicle for his philosophy is the Opening of the Fifth Seal, one of three works executed late in the artist's life for the Tavera Hospital in Toledo. The work was inspired by a passage in the Apocalypse of St. John:

And when he had opened the fifth seal, I saw under the altar the souls of them that were slain for the word of God, and for the testimony which they held: And they cried with a loud voice, saying, How long, O Lord, holy and true, dost thou not judge and avenge our blood on them that dwell on the earth? And white robes were given unto every one of them: and it was said unto them that they should rest yet for a little season, until their fellow-servants also and their brethren, that should be killed as they were, should be fulfilled (*Revelation*, 6: 9-11).

Other painters of the High Renaissance had put on canvas their vision of heaven and earth, with descending angels, aspiring souls, and rejected sinners. They too had bathed their scenes in a celestial brightness that endowed the vivid, earth-based colors they employed a radiance that spoke of the presence of God in nature.

But these colors are different. They hardly seem to derive from earthly substances at all. The areas of red and yellow are muted and completely dominated by the cool and curiously other-worldly hues of the remainder of the painting. The gigantic figure of St. John on the left is enveloped in a gray-blue robe highlighted by a pure white light that must have its source in the celestial realm glimpsed behind the swirling clouds that seem to move in a line parallel to the saint's outstretched arm and of the body of the little angel floating at the upper right of the painting.

That same radiance robs the naked figures of the risen dead of any semblance of the human flesh tones with which Michelangelo in some degree and Memling in an even greater measure endowed their resuscitated saints and sinners in their depictions of the Last Judgment. In El Greco's space, the highlighted portions of the bodies gleam with the pure white illumination that

streams through breaks in the dark storm clouds overhead, and the shadowed area tend toward the violet end of the spectrum.

And what are we to make of the figures themselves? Painted with consummate skill, they nevertheless defy the unwritten canon that set boundaries for even the most radical Italian masters who taught the Greek his craft. To be sure, it was not uncommon for Renaissance painters to make heads less long and bodies longer than they are generally seen in real life. Denys of Fourny, in his *Guide to Painting*, had written, Learn O my pupil that the body of a man is nine heads in height (Byron and Rice 94). This exaggerated proportion is especially evident in Michelangelo's frescoes on the ceiling of the Sistine Chapel. But El Greco's sinuous and elongated figures of his later Spanish period are quite unlike Michelangelo's idealized human forms. They are attenuated, fluid, unearthly, hardly seeming to be bodies at all.

How are we to account for this astounding climactic development in Renaissance art? A great deal of insightful criticism and a fair amount of nonsense have been written about El Greco in attempts to explain the characteristics that set his paintings apart from others of the era. He has been seen as a Mannerist, a reviver of Byzantine art, a madman, a proto-modernist, and, most curiously, a painter whose distinctive style can be attributed to astigmatism.

This latter theory, which enjoyed surprising popularity during the early years of the twentieth century, was presented as a plausible explanation for the figures that fill the Greek's later paintings. It is difficult to understand why it was not apparent to the critics who espoused the ophthalmic hypothesis that even if El Greco had indeed suffered from such a condition, he himself would inevitably have seen his exaggerated figures as abnormal in comparison with those who served as his models. The real explanation must lie elsewhere, and if we want to divine the reason, we must attend less to some possible visual pathology or to personal eccentricity than to the intellectual orientation that governed his artistic activity during the last years of his career. This latter theory, which enjoyed surprising popularity during the early years of the twentieth century, was presented as a plausible explanation for the figures that fill the Greek's later paintings. It is difficult to understand why it was not apparent to the critics who espoused the ophthalmic hypothesis that even if El Greco had indeed suffered from such a condition, he himself would inevitably have seen his exaggerated figures as abnormal in comparison with those who served as his models.

It is astonishing that even the modern critics who defended El Greco against the charge of visual aberration were for the most part oblivious to a

ground of art in which his roots were so deeply embedded. Meier-Graefe, who, unswayed by a turn-of-the-century characterization of the Greek as a painter of horrors, asked, Where does he come from? replied simply, We do not know (Byron and Rice, 6).

That same critic, to be sure, later found a clue to some of the mystery of El Greco's art in the mosaics of Daphne near Athens. He was not the first of the modern commentators to see Greek and Byzantine influence in Theotokopoulos paintings, but the organic continuity between Byzantine painting and the art of El Greco was clearly recognized only when critics began to discover an affinity between Byzantine and modern art and it became apparent to some of them that El Greco was a sort of missing link. The painting and sculpture that had emerged in the Eastern empire as a consequence of its struggles against iconoclasm turned away from the naturalism of earlier centuries in favor of a mystical aspiration to express in finite works the mysteries of the eternal and immutable. The felicitous result was the great tradition of Byzantine iconography, coexisting with the sort of Aristotelian philosophy espoused by St. John Damascene, whose writings were later to have a profound influence on Eastern Scholastics (Byron and Rice, 91). In the ninth century, the Patriarch Photius sparked a revival of Platonism in Byzantium (Byron and Rice, 17). Though it did not result in a revival of the naturalistic Greek and Hellenistic art, it did humanize the iconographic representation of the Byzantine painters and breathed into the art of Christendom a spirit that would ultimately move westward and transform European art.

Two centuries after Photius, Michael Pselles, a fundamentally Neoplatonic scholar, put an indelible stamp on Byzantine culture. Psellos had an encyclopedic range of knowledge, combined with a Platonic rational mysticism. One result of his enormous influence was a form of art characterized by a warmer sort of representation of the divine, which, without sacrificing anything of the mystery, nevertheless brought a still more humanistic element to iconographic art and produced its full flowering.

In a very real sense, Psellos may be considered the progenitor not only of a revitalized Byzantine and Greek culture, but of the Italian Renaissance, though centuries were to elapse after his death before the Neoplatonic spirit of humanistic mysticism would come into full flower in the West.

The relation of that spirit to art is no accident. An understanding of the relationship between philosophy and the arts permeates the *Enneads* of Plotinus in a somewhat less ambiguous fashion than is the case with Plato's writings. Works of art, Plotinus said, go back to the Reason-Principles from which Na-

ture derives and ... are holders of beauty and add where nature is lacking (Plotinus *Enneads* IV. 8. 1. McKenna 422-423).

There is a real sense in which the World Soul is for the Neoplatonists an artist, acting on the bare potentiality of matter to express something of the ineffable beauty shining through *Nous* from the One. Human bodies are expressions of soul, and the individual soul shares in the nature of the ultimately real. It too can shape its own nature as an artist shapes his work.

Withdraw into yourself and look. And if you do not find yourself beautiful yet, act as does the creator of a statue that is to be made beautiful: he cuts away here, he smooths there, he makes this line lighter, this other purer, until a lovely face has grown upon his work. So do you also: cut away all that is excessive, straighten all that is crooked, bring light to all that is overcast, labour to make all one glow of beauty until there shall shine out on you from it the godlike splendour of virtue, until you shall see the perfect goodness established in the stainless shrine (Plotinus, *Enneads* I.6.9. MacKenna 63).

None of this is to deny that not only has the Platonic tradition in its entirety been a fountainhead of inspiration for great art, but that Plato himself was not insensitive to the proper role of the arts in human life. It is true that in the *Republic* he expressed doubts not only about drama but about *all* works of representative art as simulations twice removed from reality faulty copies of particular objects that are themselves flawed reproductions of Ideas.

His criticism of the arts, however, was far less sweeping than his *penchant* for hyperbole would make it appear, for he never condemned them on the grounds of their impotence, but rather on his conviction that they are too powerful to be trusted in the hands of those not versed in philosophy. He proposed to harness that power for good by challenging the artists to prove that they could elevate their work to a sufficient height to convey to those who contemplated it the essence of the truths that lie behind the world of phenomena. This is precisely the role that Plotinus assigned to works of art. We do not so much contemplate *them* as employ them as focusing glasses through which we see with greater understanding the more real world of *Noeta*.

In the Byzantine world, the victors in the war against the iconoclasts claimed a precisely similar function for art. This was the chief iconodule contention, art historians Byron and Rice say, that pictures, like statues to Plotinus, were an effective means of communication with the extra-terrestrial universe.

This was the way iconographic painting was viewed in Crete when young

Domenikos Theokotopoulos was a boy there. The spirit of those vivid representations of spiritual truths followed him to Venice, where it was again alive in an uniquely Adriatic mode, and then to Rome, where it had found expression in the colossal work of Michelangelo, whom the boy from Crete first studied and then emulated and at last rejected. Michelangelo was a good man, he was later to remark, but he could not paint (Byron and Rice 78).

It was not until he got to Spain and became El Greco that he gradually became able to draw his nourishment from the very roots of that spirit, incorporating in his work all the skills he had learned from the Italian masters, but purifying and spiritualizing his art from sources that sprang from the rich soil of the Eastern Platonic and Neoplatonic tradition. This is not to say that at some point he discovered that he was a Platonist or Neoplatonist and decided to paint according to the canon. He was, to be sure, interested in philosophy and enjoyed talking with philosophers. He had a substantial library, though it is not known whether he ever read the writings of Plato or Plotinus. He never lectured or wrote essays on metaphysics.

Rather, his philosophy, as an expression of his soul, is in his paintings, and it is clear that he intended them to be his way of stating his profoundest convictions about the world. Like Plotinus and the Christian Neoplatonists, he saw the natural world not as inert matter, but as animate and fluid. Material objects are created and sustained by soul, and even a relatively horizontal city, in his View of Toledo seems to be straining upward, seeking to regain its identity with some celestial city from which it derives its nature.

As for human bodies, they are unlike even the most spiritually inspiring bodies of the Italian painters. Whatever incarnation of *Nous* and Soul is celebrated in the figures of El Greco's later works is an incarnation that has passed the point at which the Word initially becomes Flesh and revels in bone and muscle and sinew. The bodies of his saints and sometimes even of the infant Jesus are bathed in a white radiance that seems to draw them upward toward the One. Reality that typically makes its presence known only through rifts in the storm clouds that must be penetrated before the aspiring souls can achieve the destiny that awaits them in the celestial realm. That realm, as seen through El Greco's painting, has a reality that transcends that of the ephemeral world beneath it, imparts to it whatever life it is capable of receiving, and draws it back toward itself. Even souls in danger of damnation in these paintings never wholly lose that touch of derivative radiance, suggesting Plotinus conviction that in the very nature of a soul, it can never be entirely lost.

In 1577, the year El Greco moved to Toledo, St. John of the Cross was

imprisoned there. Whether or not he and El Greco ever knew each other is uncertain, but much of St. John's poetry embodies the qualities that the Greek achieved in his painting, as evidenced in these lines about the ascent of the soul:

The dreadful force of dazzling light  
Blinded me as aloft I flew,  
The greatest gain that ere I knew  
Was made in blackness of the night.  
But love it was that won the day,  
Blindly, obscurely did I fly;  
I soared aloft and soared so high  
That in the end I reached my prey (Myers and Copplestone 85).

The recognition of El Greco as a painter whose works embody a whole philosophy is well expressed by Byron and Price:

... for us, and in relation to us, he is always relevant and always great, great not only as a painter but as a man, one to whom the vision of his World's reality was vouchsafed and who pursued it independently of mental fashion, a cosmic figure, sustained in his own life by a profound conviction of his own magnitude. On his canvasses, the whole gamut of emotions provoked by landscape, allegory, or sitter, are co-ordinated in the expression of a grand philosophy, of the intrinsic, mystical seed of perfection contained in all terrestrial phenomena and the artist's debt thereto in his communing (Byron and Rice 3).

The grand philosophy that invested the paintings of the Greek with their enduring power to move and inspire us can have been none other in essence than the philosophy of Plotinus and the Christian Neoplatonists.

## Giorgio Vasari's *The Toilet of Venus*: Neoplatonic Notion of Female Beauty

Liana De Girolami Cheney

In *Emblematum libellus cum commentarii*, Andrea Alciato states that "the universe is a forest of symbols," that is to say, "things that are visible are the mirror of those things which are invisible (and) all the world objects have a signification." His theory of the emblem conveys a Neoplatonic view concerning the meaning of an idea or conceit (*concetto*) which was eloquently explained by Marsilio Ficino in *De vita celitus comparanda*. In this book he discusses the use and the magic potency of images by deliberating on the virtue of imagery, what power pertains to the figure in the sky and on earth, which of the heavenly configurations were impressed on images by the ancients, and how the images were employed in antiquity.

Giorgio Vasari's understanding of Neoplatonic philosophy and interest in and use of emblemata derived, as he recounts in his autobiography, from his education in the classics with Pollastra, his tutoring with the mythographer Piero Valeriano during his formative years, and his contact with the emblemist Andrea Alciato in Bologna in 1530s. Vasari assimilated specific meanings from emblem books such as Andrea Alciato's *Emblematum libellus cum commentarii* (1536), Piero Valeriano's *Hieroglyphicae* (1556), and Vincenzo Cartari's *Imagines de I Dei degli Antichi* (1547), to name but a few. These sources provided him with an extensive repertoire of images which he collected and used in the iconography for his paintings.

Under these humanistic influences, Giorgio Vasari (1511-1574) considered himself to be not merely a painter but an aesthete as well.<sup>1</sup> His ambitions culminated in his writing of *The Lives of the Most Excellent Painters*,

*Sculptors, and Architects* (*Le vite dei più eccellenti pittori, scultori e architetti*), the first edition of which appeared in 1550; a second, enlarged and revised, containing woodcut portraits of the artists, appeared in 1568.<sup>2</sup> Vasari's *Lives* consists of two components: biographies and prefaces. In writing the biographies, Vasari discusses stylistic qualities and techniques of art.<sup>3</sup> In the Prefaces (*Proemi*) he establishes not only the historical scheme for his writing of the biographies but also his aesthetics by defining the criteria by which he selects the "most excellent" artists and the standards by which their works were judged (Preface I, 7).

Vasari's criteria for assessing art accorded with conventional standards in sixteenth-century Neoplatonic philosophy. He embodies the aesthetic judgment of his time in the criteria he uses to evaluate individual works of art. Qualities he applauded were: technical proficiency especially in drawing; good composition; imitation of nature; variety and invention; and adherence to the classical art of ancient Rome. He felt that such qualities must be attained with beauty and grace of style, which meant that the work must appear to have been executed with masterful ease. He emphasized that a magical, godlike quality (genius) is the essential quality of great art. He assumed that artists' individual achievements were essentially manifestations of their own peculiar genius. But genius itself - and with it, major changes in style and technique - could be explained only by invoking the intervention of divine forces: "To save us from such great errors...the Most Benign Ruler of Heaven turned his eyes clemently to earth...and consented to send down a Spirit..."<sup>4</sup> Vasari's theory of genius or divine intervention to explain the execution of works of exemplary merit can be seen particularly applies to the artist's perception of feminine beauty and its function in the integrity of artistic expression.

Within this framework, this study considers the following: Vasari's concept of beauty as advanced in the Prefaces of the *Lives*; its Renaissance literary and philosophical sources for his concept of beauty; and its artistic embodiment in his painting *The Toilet of Venus* of 1558 (Fig. 1; Staatsgalerie, Stuttgart, Germany) and the pendant painting of *The Bacchanal* of 1558 (Fig. 2; Radiscev Museum of Fine Arts, Saratov, Russia).<sup>5</sup>

In his Third Preface of the *Lives*, Vasari defines his theory of beauty in terms of the laws of design as consisting of "*regola, ordine, misura, disegno e maniera*" (rule, order, proportion, design, and manner).<sup>6</sup> He further states:

Design is the imitation of the most beautiful things in nature, used for the creation of all figures whether in sculpture or painting; and this quality depends

Fig. 2. Giorgio Vasari, *The Bacchanal*, 1558  
Saratov, Russia, Radiscev Museum of Fine Arts

Fig. 1. Giorgio Vasari, *The Toilet of Venus*, 1558  
Stuttgart, Germany, Staatsgalerie

on the ability of the artist's hand and mind to reproduce what he sees with his eyes accurately and correctly onto paper or a panel or whatever flat surface he may be using. The same applies to works of relief in sculpture. And then the artist achieves the highest perfection of style or *maniera* by copying the most beautiful things in nature and combining the most perfect members, hands, head, torso, and legs, to produce the finest possible figure as a model for use in all his works; this is how he achieves what we know as fine style or *maniera*. (Preface III, 35).

Vasari's aesthetics (the word aesthetic derives from the Greek *aisthesis* - sensation) are concerned with the nature of the beautiful as it exists in art or in nature as well as with the physicality and spirituality of beauty.<sup>7</sup> For Vasari, physicality of beauty is perceived in the painted image and the spirituality of beauty is reflected in the evocation of the visual experience. His philosophy of art depends upon the philosophical and poetical tradition of the Renaissance, in short the Marsilio Ficino's restatement of Neoplatonism. In accordance with the Neoplatonic theory of beauty, Vasari understands beauty to be a divine creation. "He (God) fashioned the first forms of painting and sculpture in the sublime grace of created things."<sup>8</sup> Consequently, he refers to beauty as the mirror of the human soul reflecting metaphysical light and associates the beautiful with Ficino's light of the sole principle of the universe (*De Amore*) and with Plotinus's concept of "heavely Aphrodite" (*kalon* and *kaloni*) radiance or splendor, an element that results from the quality of unity inherent in the object (*Enneads*, 5- 8, 13).<sup>9</sup> Correspondingly, Vasari absorbs from Ficino's *Commentary on Plato's "Symposium" about Love*, the ancient Greek philosopher's definition of beauty "as the splendor of *divine goodness* present everywhere, personal beauty expresses an interior moral goodness," as well as, Ficino's explanation of beauty as "a process of ascent from sensual cognition of earthly beauty to the apprehension of the immortal ideal of beauty itself."<sup>10</sup> By appropriating from Ficino the interconnection between love and beauty, Vasari also embraces his notion on the essence of beauty that consists in proportion, that is, the ancient doctrine of symmetric and pleasant relationship of individual parts. According to Vasari, the origin of beauty derives from order and proportion (*la bellezza nasce da ordine e proporzione*), and at times he relates the concept of beauty with goodness (*bellezza e bontà*).<sup>11</sup> Obviously, Vasari is following Marsilio Ficino; in the *Symposium*, Ficino discusses how many things are required to create a beautiful body, such as arrangement (means the distance between parts), proportion (means quantity), and aspect

(means shape and color). He further analyzes how the proportioning of the parts have their natural position: "that the ears be in their place, and the eyes and nose, etc., and that the eyes be at equal distances near the nose...proportion of the parts...preserve the proper portion of the whole body."<sup>12</sup>

For Vasari, when artists returned to consider nature, in imitation or emulation of their ancient forbears, a rebirth occurred in the arts. Renaissance artists first imitated nature, then equalizing nature, and finally surpassed nature. Fidelity to nature meant artists mastering "naturalism" in the rational representation of perspective, foreshortening, chiaroscuro, and the knowledge of anatomy," pleasing both the eye and the mind, creating a beautiful form."<sup>13</sup>

By improving on nature, Vasari suggests, Italian Renaissance artists corrected nature's imperfections by working with the canons of proportion, by selecting the best aspects of nature, and, by achieving graceful or idealized beauty. When artists surpassed nature, according to Vasari, they responded to their *concetto* (conceit), an idea, or image of beauty, partly innate in the mind of the artist art (*invenzione*) and partly derived from previous study of nature and art (*imitazione*). Therefore, Vasari's concept of beauty derives from two principles: the ideational a *concetto* to create an image of beauty, and the realistic, a current idea about how an image of beauty can be conceived. Vasari's *The Toilet of Venus* visually represents his theory of beauty.<sup>14</sup>

Furthermore, Renaissance poets such as Baldesar Castiglione, Angelo Poliziano and Pietro Bembo adhere to Petrarch's and Dante's models of female beauty, such as Laura and Beatrice, and assimilated the poets' Neoplatonic aesthetics.<sup>15</sup> For them, a beautiful female image reflected a "celestial beauty which leads the poet or philosopher upward to the experience of divine or heavenly beauty."<sup>16</sup> Correspondingly, Agnolo Firenzuola, in his book on *On the Beauty of Women* (1548) declares:

A beautiful woman, is the most beautiful object one can admire, and beauty is the greatest gift God bestowed on His human creatures. And so, through her virtue we direct our souls to contemplation, and through contemplation to the desire for heavenly things.<sup>17</sup>

Thus, Vasari's aesthetics derives from the philosophical and poetical Renaissance Neoplatonic notion of spiritual beauty. For Vasari Neoplatonic spiritual beauty meant the manifestation of vivacity, radiance, and grace in the image perceived through reason and sight in order to move the human soul and delight the spirit, as illustrated in his *Toilette of Venus* (1558; Fig. 1).<sup>18</sup>

Moreover, Vasari deliberately selects the image of Venus as the manifestation of his theory of beauty following not only the Neoplatonic philosophy but also the literary tradition of sixteenth-century treatises on love and beauty such as Mario Equicola in *Libro di natura d'amore* (Venice, 1525), Leone Ebreo in *Dialoghi d'amore* (Rome, 1535), Benedetto Varchi in *Lezioni sull'Amore* (1540), and Agostino Nifo in *Del bello. Il bello è nella natura* (Lugduni, 1549). These Cinquecento treatises on love were inspired, in turn, on the philosophical discourse on love by Marsilio Ficino, such as his *De amore* or *Sopra l'amore* (On Love, 1474) and *Commentary on Plato's Symposium on Love*.<sup>19</sup>

Fascinated with the subject of beauty and love embodied in the image of Venus, Vasari depicted her in the theme of the Toilet of Venus in several media: in a large cartoon, in a stained glass window, and in three paintings. The large cartoon is presently lost but an elaborate description of its imagery is recorded in a letter from Vasari to Nicolo Vespucci:

A seated, nude Venus surrounded by the Three Graces: one while kneeling holds a mirror; the other with artistry braids her hair with pearls and corals in order to beautify Venus, another pours, with an emerald crystal vase, perfumed clear water in a mother-of-pearl conch for her bath. Eros, holding a bow and arrows, sleeps, reclining on Venus' garment. Other Cupids encircle the group while covering them and the landscape with roses and flowers. The ground is filled with stones; through their cracks flow water. Doves and swans taste this water. Hidden in the trees and bushes a satyr contemplates the beautiful Venus with the three Graces. His lascivious attitude, expressed by his open, wild eyes, and implied lust gesture was highly praised by Pope Clement who suggested that I paint a picture based on this drawing.<sup>20</sup>

The stained glass window was executed by Gaultieri d'Anversa in 1558 probably after Vasari's cartoon design for the Study Room in the Chamber of Caliope at the Palazzo Vecchio in Florence. The paintings were commissioned by Cardinal Ippolito de' Medici (1532), by Jacopo Capponi (1559, both paintings are now lost) and by Luca Torrigiani (1558, Staatsgalerie in Stuttgart, Germany, Fig. 1).<sup>21</sup> (The stained glass window has a similar composition to the Luca Torrigiani's painting, probably because both versions draw from the cartoon design).

In Torrigiani's painting of *The Toilet of Venus*, Vasari portrays Venus being dressed and adorned by the Three Graces (*Charites* in Greek or *Gratae* in

Latin) with numerous attributes of roses, myrtle, and a pair of doves, alluding to spiritual as well as erotic love.<sup>22</sup>

By selecting and depicting the classical subject of Venus beautifying herself, admiring herself in the mirror, and posing for the viewer's gaze and arousal, Vasari has addressed the physicality of an image embodying his aesthetic of female beauty. By suggesting she personifies both Love and Lust he alludes to astrological traditions and by including emblematic references to both Vanity and Prudence he adds Christian qualities.<sup>23</sup> Thus he manifests his assimilation of Renaissance Neoplatonism - the Christianization of pagan myths or the secularization of Christian religion.

Since antiquity the image of Venus has been defined in terms of physical beauty. In ancient Latin, the word Venus (*phosphorous*) means *the luminous one*. This appellation alludes to Venus as both planet and a goddess.<sup>24</sup> Therefore, the classical representations depict her holding a mirror (*speculum*) for reflecting her beauty, alluding to Venus magically linked to her reflection or life source, as in the Roman mosaic of third century, AD. at the Musée National du Bardo in Tunisia.

For the Platonist philosophers (Plato, Plotinus and Ficino) the planetary gods and goddesses represented poetic analogies of celestial and psychological functions. They described the operational principles of action, heart, and mind, that is to say, the psyche in which emotions, instincts and thought orbit the luminaries of the self and ego. Therefore, as a female symbol, Venus assumes the female planetary aspects associated with Luna (Moon), sensualism. For example, Venus as a planet or sphere expresses the active instinctual desire for pleasure and love, because "Love was born on the birthday of Venus."<sup>25</sup> It rules the arts, as illustrated in the *De Sphaera*, an Italian illuminated manuscript of the fifteenth-century, at the Biblioteca Estense in Modena, where Venus is depicted holding a mirror, nude, with flowers and jewelry; controlling the heavens with the zodiac signs of Libra and Taurus, and ruling on earth the aspects related to the arts and love.<sup>26</sup> Vasari endows his Venus in *The Toilet of Venus* with these ancient cosmological, philosophical and psychological implications.

In Vasari's *The Toilet of Venus*, the accompaniment of the Three Graces, as handmaidens to Venus, accords with the writings of Horace, *Odes*, I, 3 and Seneca, *De beneficiis*, I.3. Accordingly, for Horace, The Graces are usually depicted as semi-clothed because they are "free of deceit," and for Seneca, the Graces were partially clothed with exposed breasts because "benefits want to be seen." The Graces's dual character is associated with Venus's cosmic na-

ture - planet and goddess - and derives from their personification in antiquity. In the Greek period the Charities personified grace, charm and beauty and were named Aglaia (meaning Splendor), Euphrosynem (Mirth), and Thalia (Abundance) and during the Roman era the Gratiae were a symbol of gratitude - Castitas (Chastity), Voluptas (Pleasure), and Pulchritudo (Beauty). Vasari's inclusion of the Graces adds yet another dimension to the symbolism of Venus, providing a moral basis for her actions such as decorum.

In Vasari's painting Venus gazes at her reflection in the mirror. The mirror, for Christian symbolism, represents the conventional attribute for truth and is traditionally carried by a personification of Prudence. Venus' action takes place at the same time as one of the Graces pours water, an action alluding to another virtue, the personification of Temperance. The other two Graces who assist Venus in her beautification, connote through their actions yet another virtue - Charity, which is inherent in their name "Charites." Thus the visual bond that exists between Venus and the Graces in the painting alludes and reinforces the spiritual aspects of Christian or Neoplatonic "sacred love." For Vasari, then, the Graces represent Beauty, Love, Pleasure as well as Giving, Receiving, and Requiring.

In acknowledging the complex signification of the image of Venus, one realizes that Vasari's rendition of Venus does not adhere to a specific meaning. The Vasarian goddess may be viewed as a cosmological power such as the pagan planetary Venus or as a natural element such as one of the five senses, Venus might symbolize Sight. Another Vasarian's interpretation can be associated with Christian personifications of virtue such as Chaste Love, Truth (*Veritas*) or Prudence (*Prudentia*) or vice such as Vanitas or Luxuria. Furthermore, Vasari's *oeuvre* may also aesthetically reflect his eclectic nature in perceiving and conceiving art; therefore, even though paradoxically, Vasari's conceit for the image of Venus combines a mixture of significations alluding to symbols of virtue as well as vice. In addition, the use of the mirror as an attribute of the sense of Sight can imply two perceptions: the viewer's perception of Venus as young and beautiful, and Venus's intimation of her future age and ugliness reflected in the mirror. The eye of the viewer becomes the mirror of present life whereas Venus's mirror becomes the mirror of her past. Although viewers see in the painting the present beauty and future ugliness of Venus, they are seduced by the now, the narcissistic exhibition of her body (*Luxuria* and *Vanitas*). Conversely, Venus is reminded by the mirror's reflection of the transience of life and truth of her nature: "I am who I am" (Exodus 3:14). Vasari elaborates on the signification of vanitas in depicting a

narcissistic action of the part of the sacred birds of Venus—the doves—who are fascinated with viewing their image in the basin of water placed at the feet of Venus. Purposefully, Vasari creates with a diagonal movement for the viewer a symbolic and visual connection between the dove's water reflection and Venus' mirror image.

With the recent discovery of *The Bacchanal* (Fig 2), the pendant painting to *The Toilet of Venus* (Fig. 1), a voyeuristic interpretation maybe further suggested. For the Luca Torrigiani commission, perhaps, Vasari decided to represent two paintings based on his cartoon designs - *The Toilet of Venus* and *The Bacchanal*. In the drawing studies for the Bacchanal painting and in the painting itself, the "lascivious" satyr is included, assisting the intoxicated Silenus or stealing grapes and libations for himself. In the painting of *The Bacchanal*, the Three Graces, who attended and completed the toilet of Venus, can be seen, now, as Maenads dancing at the music performed with tambourines and recorders by the nymphs, fauns, and satyrs in the Dionysiac forest. Unlike Venus's beautiful attendants, Bacchus's escorts can be seen as wild beasts from the forest, such as wild horses, lions, tigers, or panthers, rams, and as symbols of fertility, since they were held sacred to him. Bacchus's companions and worshippers, intoxicated with the nectar of grapes provided by Bacchus during a drinking contest, crown and decorate their god with wreaths of laurel, ivy, and grape leaves.

The young, effeminate, idealized body of Bacchus contrasts with the aging, coarse and muscular body of Silenus and the satyrs. Vasari in representing Bacchus as an image of male beauty relies on Pliny and Vitruvius' theory of human proportions<sup>27</sup> as well as on Ficino's description *On a painting of Love* according to the poet Agathon where Love is personified by a young, tender, agile, well-proportionate and glowing man.<sup>28</sup> From Vasari's perspective, then, the beautiful depiction of Bacchus expands his theory of beauty to include the male body as well as the female body (Venus) and both images of beauty reflect a conceit of love.

These pendant paintings portray parallelism of poses, gestures, coloration, and movement. However, although Venus and Bacchus are facing each other, they do not gaze at each other: they are both self-absorbed with their individual preparation for their thirst, as Venus actively adorns herself and Bacchus passively indulges in his revelry.<sup>29</sup> Familiar with the legend of the liaison between Venus and Bacchus, which resulted in Priapus, Vasari creates with these two paintings a theatrical scene where the viewer, with humor, vi-

sually connects their actions and with pleasure anticipates a passionate conclusion.

In contrast to the cartoon's description, the painting of *The Toilet of Venus* excludes the voyeuristic satyr; however, Vasari has cleverly replaced him with the pendant painting or the viewer. This maniera conceit or teasing technique fits in well with the maniera spirit of joviality and self-absorption. On the one level the gazing action may appear to be fortuitous and puerile, with the viewer or satyr ogling the beautiful naked woman; or, on another level, the narcissistic behavior of Venus regarding herself in the mirror can be seen as an allusion to her vanity, thereby manifesting the temporal world. Obviously, the reflected image in the mirror ought to be of a beautiful, voluptuous, and ageless woman. However, on careful observation, the reflection reveals an aging and sexless woman. Is Vasari tantalizing the viewer again? Is he conveying the paradox of the Neoplatonic aesthetic, as well as his own? Does he as the Renaissance Neoplatonist attempt the reconciliation of pagan myths and attitudes reinforced by Christian religion and beliefs? Can feminine beauty be both sensual and spiritual? Vasari, again, allows the viewer to speculate and adjudicate!

Mannerist painters such as Vasari choose the image of Venus because she symbolizes both intellectual and physical powers. As a planet she rules the arts. In turn he, Vasari, as an artist and creator is ruled by her planetary force. As a female the goddess displays her beauty, and the artist, as man, is bewitched by her physical beauty.

## Notes

- \* I want to express my gratitude to Professors Aphrodite Alexandrakis of Barry University, Florida, Christopher Evangelou of Towson University, John Anton of University of South Florida, and architect John Hendrix of Cornell University, for their stimulating comments. A version of this study was presented at the Neoplatonism and Western Aesthetics Conference, University of Crete, August, 1998.

## Neoplatonism in the Design of Baroque Architecture

John Hendrix

Certain elements of seventeenth-century Roman Baroque architecture, especially in the work of Pietro da Cortona and Francesco Borromini, can be shown to be an enactment and representation of conceptual systems and epistemic structures of Neoplatonic philosophy. Neoplatonism played a role in the expression of Renaissance architects such as Leon Battista Alberti and Andrea Palladio. Neoplatonic writings by Plotinus, Pseudo-Dionysius, Nicolas Cusanus, Marcilio Ficino and Giovanni Pico della Mirandola were available to architects in seventeenth-century Rome in libraries such as the Biblioteca Casanatense, Angelica, Vallicelliana, and the Accademia dei Lincei. The ideas of those writers were also expressed in archaeological and scientific treatises by Athanasius Kircher, Giuseppe Rosaccio, Alessandro Piccolomini, Giovanni Agucchi and Ristoro d'Arezzo, and artistic treatises by Gian Lomazzo, Federico Zuccaro, and Pietro da Cortona. The writings were known by the architects and collected by their patrons. They contributed to a climate in seventeenth-century Rome which combined philosophical development, artistic theory, scientific discovery and theological tenets into a unique intellectual culture which was expressed and reflected by the architecture along with the other arts of painting, sculpture, music and drama.

The most significant elements of Neoplatonic philosophy which were translated into architectural form were the representation of the structure of the cosmos; the relationship between the universe as macrocosm and man as microcosm; the hierarchy of being, including corporeal, mental, and spiritual levels, or nature, mind and God; and the passage from multiplicity to unity.

Artistic theory addressed the imperative to connect the human mind with the mystery of the natural world in the visual arts, involving the Neoplatonic Idea, which connected the creative process of the artist with the process of creation in nature. Neoplatonic conceptual formulations were borrowed by architects and translated into architectural designs. The formulations provided the architects with a way of thinking, a way of seeing the world which they applied to the architecture. Architecture became a visual model of philosophical systems that had been developed in the Neoplatonic tradition, a tradition combining Platonism and Aristotelianism, and philosophy and theology. Elements of Baroque architecture can be shown to be an artistic expression of those systems, and a culmination of the conceptual development from the early Middle Ages through the Renaissance. Such intentions would be inherited in the late Baroque architecture of Guarino Guarini and Bernardo Vittone in Piedmont.

### The Structure of the Cosmos

In Book IX of *On Architecture*, Vitruvius described the universe as an architectural design, and the laws of architecture were identical to the laws of the cosmos. God was seen as *deus architectus mundi*, or architect of the world, and the architect was seen as *architectus secundus deus*, a second God.<sup>1</sup> In *La Sfera del Mondo*, published in 1566 in Venice, Alessandro Piccolomini wrote: "We must first know that this huge machine which we call our world was made by an extremely wise and powerful architect."<sup>2</sup> In reconstructions of the Vitruvian theater, Giovanni Giocondo and Cesare Cesariano, among others, inscribed four equilateral triangles in a circle to create twelve points along the circumference of the theater, to "define the twelve locations of the zodiac described by astrologers as harmonious music derived from computations based on the stars."<sup>3</sup> Giulio Camillo wrote of his *theatro*, where information was categorized by location in the plan of a theater to aid memory, published in *Tutte le opere* in 1552: "When these signs have been gathered together according to an organic order and impressed on the memory by their images and symbols, the mind can move away from this middle celestial world...towards the supercelestial world of the Ideas...in harmony with astral influences."<sup>4</sup> The links between levels of reality in the *theatro*, between the signs and what they signified, are occult forces and astral influences.

The purpose of the *theatro* was to allow the soul to be harmonized with the celestial machine of the universe through the symbols. Frances Yates has

written, "The theater is a vision of the world and of the nature of things seen from a height, from the stars and the super-celestial founts of wisdom." Renaissance cosmology was the meeting ground between the rational and mathematic order of Greek science and the mythology and magic of the East.<sup>5</sup> In the Pythagorean musical theory revived by Nicolaus Cusanus and the Florentine Platonic Academy, music is divided between the inner (*humana*) and the cosmic (*mundana*).<sup>6</sup> The *musica humana* was seen as the movement of the macrocosm, the planetary rhythms, reflected in the soul. Similar intervals would be found between musical tones as between planets, and between aspects of thought and aspects of external reality. As Ficino wrote in the *Commentary*, "In all these things the internal perfection produces the external."<sup>7</sup> Pythagorean ratios of numeric harmony were enacted by Alberti in the facade of Santa Maria Novella.<sup>8</sup>

In seventeenth-century Rome, Pietro da Cortona's painting *Allegoria del Tempio della Sapienza*, and his preliminary design for the church of the Accademia di San Luca, Santi Luca e Martina, can be read as "allegorical representations of a cosmological idea."<sup>9</sup> Numerology and symbolic geometry were incorporated into the design of many Renaissance and Baroque churches. In *Allegoria del Tempio della Sapienza*, the *Sapienza Minerva*, *Magna mater* and also allegory of Rome, appears seated in a temple surrounded by columns in a circle, with a statue of Mercury in a niche. The Allegories of Virtue stand between the columns, while female figures representing the cosmological sciences enter the temple carrying a globe with stars, a model of the planets, and geographical maps. The architect, with a table on which the orders of columns are depicted, gestures to the cosmological sciences as the origin of the orders.<sup>10</sup> In the plan for Santi Luca e Martina, circles of columns, twelve on the exterior and eight on the interior, are references to a cosmological system, as is a circle inscribed in a square. The twelve columns on the circumference of the round plan refer to the twelve locations of the zodiac; the number eight is a universal symbol of resurrection, combining pagan numerical symbolism and Christian theology. In *The Celestial Hierarchies*, in the sixth century, Pseudo-Dionysius ascribed angelic hierarchies to the zodiac. Cortona's circle represents God as well, while the square represents the squaring of the four elements of the physical world - earth, air, water, and fire - from Plato, and the conception of man, from Neoplatonism. In the *Teatro del Cielo e della terra*, a book owned by Cortona,<sup>11</sup> Giuseppe Rosaccio stated that the elementary or incorruptible part of the cosmos is divided into the four elements,<sup>12</sup> an idea derived from Alessandro Piccolomini's *La Sfera del Mondo*.

The circle inscribed in the square can be read as both a Platonic symbol of universal harmony and the *Christos-Logos* of Christ.<sup>13</sup> In Neoplatonism the symbolic representation of cosmic harmony and the intellectual "Idea of the Beautiful" are combined with Christian theology. As described by Plotinus in *The Enneads*, "One who has attained to the vision of the Intellectual beauty and grasped the beauty of the Authentic Intellect will be able also to come to understand the Father and Transcendent of that Divine Being."<sup>14</sup> A papal brief issued by Gregory XV in 1623 and owned by Cortona read "No faculty can compete with the three arts from antiquity (architecture, sculpture and painting), as God himself participated in the construction of the world...where he was an admirable painter drawing the perspective of the earth and an amazing sculptor shaping clay with his hands in the creation of man, and he was the greatest architect in the great construction of the universe."<sup>15</sup> God, who had created Man in his image, consented to allow man to form a new intelligible cosmos through the work of art, a second cosmos as a reflection of the original divine creation. From the *Enneads*, "Artists do not simply reproduce the visible, but they go back to the principles in which nature itself had found its origin."<sup>16</sup> Such an intention can be related to Alberti's conception of *concinntas*, where Pythagorean ratios of numeric harmony, or eurythmia, were enacted with the intention to represent the laws by which nature produces works so as to transfer them to architecture, in order that architecture embody the ideational formation of an abstract beauty according to those laws, as at Santa Maria Novella.<sup>17</sup> In such a way the structure of the universe and the structure of the mind are enacted and related simultaneously.

In the treatises on the Vitruvian theater by Giocondo and Cesariano, an exterior semi-circle is inscribed in a square to form the proscenium area of the theater, and a square is placed on the interior. In Renaissance art, the square is associated with the Four Virtues, and the four personifications of the arts. A catafalque constructed for Michelangelo in the church of San Lorenzo in Florence includes paintings representing the Four Virtues as Spirit, Mercy, Knowledge, and Industriousness,<sup>18</sup> and the four personifications of the arts, Architecture, Painting, Sculpture and Poetry. In Neoplatonic thought, the square represents the earth as a manifestation of God. It also corresponds to human form, and the materialization of the Idea, or the design in the mind of the Creator.<sup>19</sup> From Ficino, "The form of all things conceived in the celestial Mind are the Ideas."<sup>20</sup>

Cortona described the relation between intuition and cosmic structures in the *Traatto della pittura, e scultura*:

One benefits from [intellectual] delight, while in images the soul knows through discourse the reason of various things, without apprehension and sensual knowledge; as in a painting of a serene and nocturnal sky, the intellect understands the great speed of celestial motion, the many revolutions of the heavens, and the motions of the planets, which indicate the magnitude of the sun, the moon, and the stars; with this knowledge intellectual delight is received.<sup>21</sup>

The mind is connected with the mysteries of the cosmos through the visual arts. Images communicate intellectual ideas, which are signs of God in nature. "Divine and eternal Ideas are images made by God...of the entire machine of the universe."<sup>22</sup> In his *Discourse* of 1611, Giovanni Agucchi, with the help of Galileo Galilei, developed a metaphorical system of the universe in which the central immobile motor is the seat of the eternal and divine Idea, the seat of absolute unity, goodness, and beauty. The center is the divine sun, "which as the beginning brings back and unites all things." It is the source of all beauty and "true form and idea," the beginning and end of all movement, and the center of the revolving cosmos.<sup>23</sup> Agucchi said that this theory "conformed to Christian truth."<sup>24</sup> Gian Paolo Lomazzo, in his *Idea del Tempio della Pittura* of 1590, which was inventoried in the library of the Accademia di San Luca in 1624,<sup>25</sup> sought to apply the "order, measure and appearance"<sup>26</sup> of the mathematical system of the structural harmony of the cosmos to the design arts. Ristoro d'Arezzo wrote in *Composizione del mondo* that the cosmos is "a well organized house, or a solemn temple, with a sky with points of stars like a historiated stained-glass window with holy images, which bears the sign of God which rises from a chorus of angels."<sup>27</sup> The role of the artist was to observe nature in order to discover "the forces which agitate the conscience of beings and spirits which circulate in the middle of things,"<sup>28</sup> and then to read and represent them. In a design for the Villa Pamphili, Borromini intended to construct an architecture based on the observation of celestial movements, as he wrote in a letter preserved in the Vatican Library.

In Neoplatonic philosophy, the human being is a microcosm of the universe, interior relations and movements are connected to cosmic relations and movements, and the individual soul participates in the Divine mind. Ficino described man as a microcosm organized and functioning according to the same principles as the macrocosm of the universe, given coherence by the "dynamic principle of Platonic love, so that the soul in its own way will become the whole universe."<sup>29</sup> For Cusanus, "Human nature contains in itself the intellectual and the sensible natures, and therefore, embracing within itself

all things, has been called the microcosm or world in miniature."<sup>30</sup> Renaissance architects saw the church as being a microcosmic recreation of the universe as temple of God, as for Palladio "The little temples we make ought to resemble this very great one, which, by his immense goodness was perfectly completed."<sup>31</sup> Alberti expressed an intention to impart the presence of God in the architecture of the church: "I would deck it out in every part so that anyone who entered it would start with awe for his admiration at all the noble things, and could scarcely restrain himself from exclaiming that what he saw was a place undoubtedly worthy of God."<sup>32</sup>

### The Hierarchy of Being

In the design of many Renaissance and Baroque churches, the ascension of forms from the ground floor to the cupola and lantern can be read as a passage which the worshipper experiences from the corporeal world to the world of God, represented by the pure light shining through the lantern. The light shining through the oculus at the end of the nave of Alberti's Sant' Andrea can be read as the attainment of the absolute oneness of God, resulting from a passage through a multiplicity of forms in the elevations of the nave, where geometrical shapes and architectural elements appear in a complex variety of sizes, positions, and inter-relationships. "Relations among the multiplicity of forms manifest the one Final Cause of Harmony,"<sup>33</sup> creating the impression of unity through diversity and harmony through multiplicity, as a microcosm of the order of the universe, as the singularity of the soul relates to the universality of the cosmos in Neoplatonic thought. The interior of the church in seventeenth-century Rome often accommodates the procession down a long barrel-vaulted nave of a Latin Cross plan, lined with columns and architraves representing classical temple fronts, toward a vanishing point which is the altar and the sight of transubstantiation, the culmination of the spiritual journey represented by the procession. Such a construction can be seen in designs for apparatus for church festivals, combining church interior and stage construction, such as Cortona's design for the *Quarantore in San Lorenzo e Damaso* in 1633. The finite representation of the infinite is achieved through the mechanism of perspectival construction.

As Alberti expressed his intention to impart the presence of the ineffable God through architecture, so that "anyone who entered it would start with awe for his admiration at all the noble things," the incitement of such awe would be

accomplished through *concinntas*, involving the composition of "parts that are quite separate from each other by their nature, according to some precise rule, so that they correspond to one another in appearance,"<sup>34</sup> in the attainment of the absolute through the multiple, enacting the relationship of the human mind to the external world through underlying principles unknowable to reason or sensual experience alone, as enacted at Santa Maria Novella. Alberti's conception of *concinntas* can be related to Marsilio Ficino's ideal of a mystical property as an organizing element. As for Alberti, where *concinntas* is an ideational object beyond sense experience, "conjoined to the spirit and reason,"<sup>35</sup> so for Ficino in the Commentary,

Since the single parts of the soul have been reorganized into one mind, the soul is now made a single whole out of many...when the soul has been made one which is in itself the very nature and essence of soul, it remains that immediately it recovers itself into the One which is above essence, that is, God.<sup>36</sup>

*Concinntas* is for Alberti the law of that ideational One which is above essence. For both Ficino and Alberti, God is both exterior to and producing the finite universe, and identical with the infinite universe, reconciling Platonism and Aristotelianism, as in Neoplatonism.<sup>37</sup>

In seventeenth-century Rome, Francesco Borromini inherited certain intentions to relate architectural structure to philosophical ideas, interweaving theological traditions, Platonic hierarchies of being and Aristotelian development into his architecture. Aspects of Neoplatonism which can be read in Borromini's architecture, especially the church of San Carlo alle Quattro Fontane, were a syncretic coincidence or reconciliation of opposites, a structuring of the conceptual process as a microcosm of the order of the universe, the representation of the absolute being inaccessible to reason, the transition from multiplicity to singularity, and the hybridization of form.

Cusanus wrote, "In the providence of God contradictions are reconciled."<sup>38</sup> The design of San Carlo contains the reconciliation of contradictions: alternating balustrades, convex and concave elevations enclosing a space, and simultaneous enclosure and expansion through the illusion of extended barrel vaults from the central space. The building may have been conceived as a conceptual microcosm, a metaphysical system, based in the hierarchies of Neoplatonic philosophy. Borromini may have been associated with Athanasius Kircher, who taught Neoplatonic philosophy at the Università dei Marmorari, which met at the church of Santi Quattro Coronati al Celio in Rome in the early Seventeenth

Century. Borromini is recorded as having been a student there at the same time in the Book of the Carmelengo in the *Archivio dell'Università*.<sup>39</sup> He was a friend of Virgilio Spada and was employed at the Palazzo Spada. His uncle and mentor, Carlo Maderno, was a member of the Accademia di San Luca.

San Carlo can be read, like many Italian Renaissance and Baroque churches, as an analogue to an ascending movement through levels of being in the structure of the universe, where the ascension through the forms of the interior space to the cupola and to the lantern corresponded to Neoplatonic elements of the corporeal, mental, and spiritual levels of being. In the *Platonic Theology* and the *Commentary on Plato's Symposium*, Ficino classified the elements in the hierarchy of being in ascending order as Body, Nature, Soul, and Mind, corresponding to the four elements of the physical world. "Just as a single ray of the sun lights up four bodies, fire, air, water, and earth, so a single ray of God illuminates the Mind, the Soul, Nature and Matter."<sup>40</sup> Those elements were characteristics of both man and the universe, so that the building as structural conception of being was a microcosm of the universe. Mind is the first level emanating from God, "turned toward God, illuminated by his ray...God, who is omnipotent, imprints on the Mind, reaching out toward him, the natures of all things which are to be created. On the Angelic Mind are painted all the things which we perceive in these bodies."<sup>41</sup> The lower level of Mind is the Soul, self-moving, originating from chaos and receiving forms from the Mind. "Although the World Soul is at first formless and a chaos, when it is directed by love toward the mind, having received from it the forms, it becomes a world."<sup>42</sup> The soul is divided into higher and lower, or reason and perception. The Higher Soul is divided into two faculties. Reason and Mind, Reason being directed toward corporeal perception, while Mind is directed toward the *intellectus divinus*, or contemplation. The Lower Soul is biologically predetermined, by fate. It is composed of functions relating to physiology, external perception and internal perception. The physiological functions are propagation, nourishment and growth. "If we say that man procreates, grows, and nourishes, then the soul, as father and creator of the body, begets, feeds, and nourishes."<sup>43</sup> External perception incorporates the five senses while interior perception is an imaginative faculty which translates physical signals into mental images. "Men possess both reason and sensation. Reason by itself grasps the incorporeal Reasons of all things. Sensation, through the five instruments of its body, perceives the images and qualities of bodies."<sup>44</sup>

The design of San Carlo contains the use of three basic geometries, the octagon, cross, and circle or oval, repeated in different combinations in the

plan and elevations of the worship space, and the cupola and lantern.<sup>45</sup> The interwoven, inter-penetrating geometries which define the plan and elevations correspond to the sublunary, corporeal world of nature and the body, the realm of procreation and growth, where divine light has become corrupted and diffused, resulting in imperfect beauty and obscured knowledge in the world of images. The ordering and juxtaposition of the geometries in the pattern of the cupola correspond to the Soul or Intellect, the lower part of the Mind, mediating between the corporeal and spiritual, rationalizing the forms found in the chaotic realm of matter. The resolution of the same geometries in the emblem in the lantern, as they became a single unified image, expresses the absolute, unified and pure form of the Divine spirit and Mind, the source and point of emanation of light and form, illuminating the congregational space. The forms of the lantern are uncorrupted and inaccessible, "containing the prototypes of all that which exists in the lower zone."<sup>46</sup> The church can be seen as a representation of the Neoplatonic *circuitus spiritualis* of the universe where the static ideas of the Cosmic Mind are converted into "dynamic causes moving and fertilizing the sublunary world," in the words of Erwin Panofsky.

The interweaving of the three geometries, the circle, cross and octagon, in the plan of San Carlo is an elaboration of the Pythagorean juxtapositions begun by Alberti. It is a geometric construction based in numeric proportions. For Nicolas Cusanus, the transmutation of geometries was the transcendence of boundaries of thought, and thought was defined as the imperceptible movement from the universal to the particular.<sup>47</sup> A logical geometric progression, a transmutation of geometries by Borromini, is disguised in the unrecognizable form of the plan of San Carlo, an inexplicable "lozenge" shape, as the underlying reason of nature is unrecognizable in its forms, as resulting from *concinntas*, in the projection of logic onto nature. In the tradition of medieval guilds and occult knowledge, the hidden or secret, the underlying geometry of the architecture was not to be revealed.

The conception of the structure of thought in the hierarchies of Ficino's *Teologica Platonica*, or *Platonic Theology*, the architectonic, can be characterized as a combination of hierarchy and motion, or dynamic passage, as a microcosm of the structure of the universe, as elaborated in *Five Questions Concerning the Mind*:

First, whether or not the motion of the mind is directed toward some definite end; second, whether the end of this motion of the mind is motion or rest; third, whether this end is something particular or universal; fourth, whether the mind

is ever able to attain its desired end; fifth, whether, after it has obtained the end, it ever loses it...We cannot reach the highest summit of things unless, first, taking less account of the inferior parts of the soul, we ascend to the highest part, the mind. If we have concentrated our powers in this most fruitful part of the soul, then without doubt by means of the highest part itself, that is, by means of mind, we shall ourselves have the power of creating mind...The motion of each of all the natural species proceeds according to a certain principle...the limits of motion are two, namely, that from which it flows and that to which it flows. From these limits motion obtains its order.<sup>48</sup>

The power of the creating mind is enacted in the architecture of the Baroque church, by an ascension through the soul to its highest part, the mind. Each of the five questions is in turn enacted: the teleology of the ascension, the juxtaposition and interweaving of movement and repose in architectural forms, and of particular and universal, the possibility or impossibility of absolute knowledge, and the teleology of that knowledge. Movement is directed both towards and away from the divine source of emanation, the light from the lantern, so it can be inferred that the teleology of the ascension and of the absolute knowledge are the same. From the *Commentary*, "As they flow from Him so they flow back to Him...Mind, Soul, Nature, and Matter, proceeding from God, strive to return to the same."<sup>49</sup> In the tradition of Cusanus, the architectonic is constructed on the knowledge rather than the existence of God or universal intelligence. Such would be a structural analogy between the conceptual process and the structure of the universe, imaged in terms of structure and motion, generation, procreation, fragmentation and dissemination in both thought and physical reality. Erwin Panofsky described the motion of the hierarchies in Ficino's *Teologica Platonica*:

This whole universe is a *divinum animal*; it is enlivened and its various hierarchies are interconnected with each other by a "divine influence emanating from God, penetrating the heavens, descending through the elements, and coming to an end in matter." An uninterrupted current of supernatural energy flows from above to below and reverts from below to above, thus forming a *circuitus spiritualis*, to quote Ficino's favorite expression. The Cosmic Mind continually contemplates and loves God, while at the same time caring for the Cosmic Soul beneath it. The Cosmic Soul in turn converts the static ideas and intelligences comprised in the Cosmic Mind into dynamic causes moving and fertilizing the sublunary world, and thus stimulates nature to produce visible things...With all its corruptibility the sublunary world participates in the eter-

nal life and beauty of God imparted to it by the "divine influence." But on its way through the celestial realm the "splendor of divine goodness," as beauty is defined by the Neoplatonists, has been broken up into as many rays as there are spheres or heavens. There is therefore no perfect beauty on earth.<sup>50</sup>

Such is the aesthetic of the Baroque, the contrast between the purity of the ineffable Cosmic Mind as "that which is denied to words," and the signification of the "dynamic causes moving and fertilizing the sublunary world," an "infinite materiality of images and bodies"<sup>51</sup> in architectural forms which "proliferate beyond everything signified, placing language in excess of corporeality." The proliferation and fragmentation of rays is best represented in Bernini's *Ecstasy of Saint Theresa* and *Chair of Saint Peter* in Rome.

The dynamic passage through the hierarchy of being, interwoven physical matter and proliferation of bodies, toward a resolution of forms in the purity and transcendent light of the lantern displayed in the structure of San Carlo can be read as well in ceiling frescoes in Baroque Rome such as the *Glorification of the Reign of Urban VIII* by Pietro da Cortona in the Gran Salone of the Palazzo Barberini, and the *Missionary Work of the Jesuits* by Andrea Pozzo in the church of Sant' Ignazio and the *Triumph of the Sacred Name of Jesus* by Baciccio in the church of Il Gesù at the end of the century. In the Renaissance, the passage could be read in the *Assumption of the Virgin* in the Cathedral of Parma by Correggio from 1526, where entangled, gesturing bodies encircle and give way to a blinding ineffable light, the light of the sun and Divine wisdom. For Ficino "God is the center of all things, completely single, simple, and motionless. But all things produced from Him are many, composite, and in some way movable."<sup>52</sup>

The void at the center of a circle is an element of Neoplatonic thought and Dionysian Negative Theology, where God is unknowable and inaccessible. Cusanus's version of negative theology is the *via negativa*, where God can only be perceived in His absence and cognitive knowledge is rejected to achieve mystical union in the 'cloud of unknowing', later manifest as the Baroque *stupefazione*. The circle is the perfect manifestation of God, and at the same time absolute unknowing, or learned ignorance. In Renaissance treatises on theater design, Alberti described the stage of the theater as the void at the center,<sup>53</sup> and Cesariano wrote that "the formation of a theater begins with the base perimeter circling around the central void in a rotating line."<sup>54</sup> In the void at the center of Roman Baroque ceiling frescoes, the blank space of a blinding

divine light can be understood to represent the inaccessible and unknowable God, as can the source of light in the lantern of the Baroque church.

### Late Baroque Architecture

Intentions to represent philosophical systems in architecture, including Neoplatonic ones, were inherited by Guarino Guarini and Bernardo Vittone in Piedmont. The exterior of Vittone's Cappella della Visitazione in Vallinotto, for example, reveals a three-tiered hierarchy of the worship space, cupola and lantern, as at San Carlo. Vittone wrote about the church in his *Istruzioni diverse*, that "The visitor's glance travels through the spaces created by the vaults and enjoys, supported by the concealed light, the variety of the hierarchy which gradually increases."<sup>55</sup> Vittone's architecture incorporates conceptual systems, as can be seen in the architecture and passages from his *Istruzioni elementari*, published in Lugano in 1760. The laws of nature continue to inform the laws of architecture for Vittone. Mathematics and geometry, the keys to the universe, as in the *visio intellectualis*, are related to movement and variation in time and continuums, and drawn from celestial observations, as knowledge was given for Lomazzo and Cortona. Guarini described geometry as the "mirror of the world." Vittone wrote in *Istruzioni elementari*, "If a glance is raised to the sky, one watches to see in its movements the order of the many luminous bodies, constant and exact in correct division, and inalterable measure in time...demonstrating according to the science of numbers revolutions around variable centers, and the value of force."<sup>56</sup>

The law of numbers and proportion, translated and displayed in architecture, is innate in organic bodies and natural phenomena, as in *concinnitas*. "Were not the rays of the sun demonstrated to be reflections, refractions and influences with immutable orders of numbers, with changing and well-regulated vicissitudes, and with intervals of space and divisions of musical grades?"<sup>57</sup> All mathematical and numerological relations and proportions found in the natural universe are manifestations of the instrument of God, of the universal and divine intellect. "God created in the Holy Spirit, which was seen, counted and measured...This among the human sciences is that in which God wishes, in a singular manner more than in any other, to deposit and conceal its mysteries."<sup>58</sup>

### Conclusion

There is ample evidence to indicate that Neoplatonic philosophy played a role in the conception of the design of seventeenth-century Roman Baroque architecture, and that there is a philosophical or conceptual basis underlying Baroque architectural forms. The forms of the architecture can be understood in relation to their cultural context - the epistemological structures, philosophical and scientific beliefs, and artistic theories of the seventeenth century. This architecture can be seen to express and reflect the complexity of the epistemology of the culture, the foundations of its knowledge, unique in its combination of theological tenets, philosophical understanding and scientific knowledge and practice. Architecture can enact the relation between thought and physical reality. As Ficino wrote in the *Commentary*, "If anyone asked in what way the form of the body can be like the Form and Reason of the Soul and Mind, let them consider the building of the architect."<sup>59</sup>

## Poetic Hierarchies in the Works of Nikos Kazantzakis

John P. Anton

### 1. Introduction

Much has been written on the varieties of hierarchies of values and beings. The model *par excellence* that has influenced art and literature, in particular, is Plato's *Symposium*. The topic of my paper takes me back to the Platonic ladder of Eros and the Plotinian ascent to the One as models for poetic hierarchies, including Kazantzakis' own, but for one difference, as I hope to show, namely that Kazantzakis' concept of the ladder is closer to the Neoplatonic vision of ontic hypostases and the religious deontology of the Byzantine philosophers and theologians than it is to Plato. It was Plotinus who for the first time assigned to the poet and the artist in general the task of stratifying the ontic values of the emanations of the One in accordance with their degree of beauty and goodness. He showed the way to the Christian theologians on how to adjust their salvational teachings to their alternative systems of religious virtues. The ensuing movement, reflected in the writings of Pseudo-Dionysius, reached its apex in the deontic hierarchies of Ioannis of Klimakos in the sixth century.

As far as I know no one of Kazantzakis' commentators has referred to a possible connection to Plotinus or Ioannis of Klimakos, probably on account of the absence of conspicuous signs indicating direct influence. Nevertheless, his indebtedness to Plotinus' aesthetics is there. The Renaissance and modern formulations of the role of the artist have their origins in the Neoplatonic philosophy of art, despite what the manifestoes of modern art say about the nature of that role after turning away from all ties to Platonic and Plotinian ontologies, with much help from the rising tide of subjectivism and of psychoanalysis.

Kazantzakis, as creative artist, is part new and part old. In his reflections on the role and mission of the artist-poet he still uses the idea of the ladder though not that of Eros in Plato's *Symposium* or of the hierarchy of the Plotinian hypostases, but with an important difference. As I mentioned before, he replaces their conceptions of duty with a deontology of his own hierarchies, that is, a ladder of duties in accordance with his special understanding of religious consciousness. As a result, the artistic act takes on the character of a new type of *hubris*, one that heralds the salvation of God. In fact, the act stems from a duty to be performed by the estranged human being who must span the abyss of human existence between birth and death. To make this point clear, I must first discuss briefly the Platonic and Plotinian models.

## 2. Diotima's message and the Ladder of Eros.

When Socrates' turn came in the *Symposium* to praise Eros on the evening of the celebration of Agathon's victory in 416 B.C., instead of following the pattern of the previous speakers, he proved faithful to his avowal of ignorance and limited his peroration to the lessons he learned from the priestess Diotima.

I will not try to offer yet another account of the Platonic grading of the desirable erotic objects. My remarks address only the main points. To begin with, eros is the desire for fulfillment, and more precisely, for immortal things, the "everlasting goods." There is more to be said about the identity of eros as "the desire for the perpetual possession of the good" (206a). Diotima taught Socrates the mysteries of eros but not without some doubt whether he could grasp the perfect revelation. It was right after this admission that Socrates proceeded with the narrative about the path the pilgrim must follow to climb the ladder of eros, the upward way of the *anabathmoi*: (1) falling in love with one beautiful person and together beget noble thoughts; (2) loving all beautiful bodies and learning how to control the passion for the one person; (3) loving the soul as more worthy and of greater honor than the beauty of the body, content "to make the young people better;" (4) loving the beauty that exists in actions, institutions and the laws; (5) loving and preparing to turn to the beauty of the sciences and especially the science of beauty once the person has matured and become inexhaustible in spirit; (6) finally, at the end of the journey, when loving is for beauty itself, marvelous, perfect, unique and eternal. And at the opening of her summary Diotima states:

This is the right way of approaching or being initiated into the mysteries of love, to begin with examples of beauty in this world, and using them as steps to ascend continually with that absolute beauty as one's aim, from one instance of physical beauty to two and from two to all, then from physical beauty to moral beauty, and from moral beauty to the beauty of knowledge, until from knowledge of various kinds one arrives at the supreme knowledge whose sole object is that absolute beauty, and know at last what absolute beauty is.<sup>1</sup>

The person who reaches the heights of the last rung of eros, she concludes,

will be able to bring forth not mere reflected images of goodness but true goodness, because he will be in contact not with a reflection but with the truth. And having brought forth and nurtured true goodness will have the privilege of being beloved of God, and becoming, if ever a man can, immortal himself."<sup>2</sup>

The levels of beautiful objects in the Platonic hierarchy of Eros, forming as they do, an ascending order, have exerted a long and interesting influence in the history of Western aesthetics and poetry. As a model of hierarchies it found a special place in the philosophies of the Neoplatonists. Two things stand out here: (1) the priority assigned to beauty in the unfolding of Eros, and (b) the pursuit of virtue as an imperative to quicken the awakening of Eros.

The ascending order of the objects of eros, forming an unbreakable continuum of aesthetic, ethical and epistemic values, eventually was absorbed into the doctrines of subsequent philosophical speculations. Many of the systems that assimilated the Platonic hierarchy of love, although themselves different in structure and objectives, e.g. the various Neoplatonist schools, did so to bolster their ontologies or enrich their ethical and religious visions. What interests us mainly is the influence the Platonic model exerted by assigning to Beauty the highest place in the erotic pyramid of values.

Speaking of influences, it is interesting to note that Kazantzakis published an article titled "The Sickness of the Century" in 1906, when he was only twenty-four years of age, and stated the following: "I never get tired of reading Plato's *Symposium*. In my view it is the great, the holy revelation of the Hellenic world."<sup>3</sup> The fervor subsided as he grew older and he found other mentors and new teachers with different messages and novel concerns. I will return to this side of his development later in my paper. I must now move on to Neoplatonism to show how its conception of the role of the artist-poet anticipates and resembles closely certain modern views of the artistic self-image, including that of Kazantzakis.

### 3. Beauty and the Ontic Hierarchies in Plotinus

Plotinus' views on the role of the artist-poet are surprisingly close to certain dominant currents and concepts regarding the modern artistic self.<sup>4</sup> I will limit my comments only to those aspects that pertain to the hierarchy of duties in Kazantzakis's *Spiritual Exercises (Salvatores Dei)*, specifically to Plotinus' views on the origin of Beauty, artistic creativity, and the role of the artist in the pursuit of the union with the absolute One.

For Plotinus, absolute Beauty is of divine origin. Being one of the eternal Ideas, it resides in the hypostasis of *Nous*. In lesser grades it is also present in descending order in the hypostases of the World Soul and Nature. The human soul, although it partakes of the higher hypostases, never ceases to desire the unity with the source of its being. Thus Eros for Plotinus has a cosmic mission, to bend the human will to its ultimate purpose while following the course on the path of Beauty. If so, the model for a fulfilled life is not rooted in social, not even in religious experiences, but in the universe itself, the origin of which is the One, the highest good and ultimate purpose of the soul. The absolute One is therefore the womb of all values and the target of the soul's voyage, the Return. Human life is an Odyssey with a transcendent Ithaka: the One.

The ascending path guides the traveler through the Ideas of *Nous*: the Forms of Truth and Beauty and of the Good. There remains then only the ultimate move, the last step beyond all beings: the mystical union with the absolute One. On the way to pursuing this end, the soul discovers how the Beauty of art converges with the truth of philosophy to attain the Good of the ethical life.

Artistic creation, when aiming at Beauty, is at once ethical and cognitive action. Art, for Plotinus, is both imitation and creation. It must imitate only the Idea of Beauty and create things that cannot be found in the sensible world. As imitation, genuine art is not beholding for content to themes that lie lower than the soul's own essence, and therefore it neither copies nor describes the sensible objects in nature, plants and animals, not even the passions and sufferings of human beings. Art as imitation must pursue the higher values residing in the World Soul and in the Ideas of *Nous*. From its own stance, art treats the world as a symbol of the ideal. To succeed in his mission the artist must assign a new role to the imagination: to create symbols representative of the higher realms of Beauty. The initial duty of the artist is to save the beauty of nature and at the same time transcend it. Whereas nature makes beautiful things un-

consciously, the human agent as authentic artist adds to the natural matter of the sensible entities the beauty of the spirit.

Hence, the true artist can only turn within the soul to elevate nature to spiritual heights. In consequence, the value of art works flows only from the artist's soul, not from any moral, political or religious beliefs. Such is the tradition that forms much of the background of Kazantzakis as an artist-poet. Thus, since Beauty pervades nature in all its variety, the artist's duty is to save the divine through acts of superior creativity.

According to Plotinus, the two creative agencies, nature and the human soul, are also causal principles and both have a common ultimate source: the absolute One: "Every prime cause must be, within itself, more powerful than its effect can be: the musical does not derive from an unmusical source but from music" (*Enn.* V.5.1, 30-31). None of the artist's creations expresses the Prime Cause fully. Even the best works of art fall short of the Idea of Beauty that resides in the soul, or rather in the mind (*nous*) of the poet who has attained knowledge of the higher hypostases. For Plotinus, the artist expresses the beauty that resides in the imagination exclusively with the aid of symbols and the imaginative imitation of the higher grade of being. The artist has the ability and the duty to reveal or decipher the ideal face of aesthetic perfection and can do so only through the return to the hypostasis of *Nous*. The artist hence saves and humanizes nature. The aesthetic worth of his creations results from his own assertive act, not from external customs, rules, beliefs.

The theory that art springs mainly from the aesthetic wealth of the cognizing imagination is found in Plotinus its first defender. In his ontology of Beauty, art, despite its divine origin, does not embody the highest good. Beyond art lies the wisdom that is needed to train the human soul to master the method of the hierarchical ascendancy to Being. More importantly, wisdom alone can foreshadow the vision that accompanies the last leap. Only thus can the soul gain full understanding of its descent and ascent, its fall from and return to the One:

If one goes on from oneself, as image to original, one has reached 'the end of the journey'. And when one falls from the vision, he wakes again the virtue in himself, and considering himself set in order and beautiful by these virtues he will again be lightened and come through virtue to Intellect and wisdom and through wisdom to that Good. This is the life of gods and of godlike and blessed men, deliverance from the things of this world, a life which takes no delight in

the things of this world, escape in solitude to the solitary." (*Enn.* VI. 9. 11, tr. A. H. Armstrong, in Loeb).

#### 4. Kazantzakis and the Hierarchies of Action

By the time the Neoplatonic tradition reached Kazantzakis, the cosmic hierarchies had withered but not the role of the artist. The duty to respond to the inner beauty of the soul had lost none of its force. It called for new and different hierarchies.

Early in his career as poet-artist, Kazantzakis was responding to a world he believed had lost faith in the eternal vigilance of the living God and had shifted its attention to a culture without permanent values. In a world where God is dead, the human spirit has a duty to save the divine. Such is the motif of Kazantzakis's *Spiritual Exercises* and his *Odyssey*. Both works, the first as theoretical vision, the second as epic action, stress the command that man in despair must heed the call to resurrect the divine. Both works herald the new imperative: Man must save God. Since God can no longer save man, creative action must follow a new chain of duties, a new deontological hierarchy. The rungs on the poetic ladder of duty become clear as soon as the imperative is put into action. But what is the meaning of the imperative and how can man save God if God does not exist?

Substituting the term 'religion' for the term 'God' makes it easier to understand how Kazantzakis follows a Nietzschean model to enlist art in the service of a revitalized sense of religiosity beyond and above the Christian salvational goal. But preserving the initial expression engenders a thorny problem. The term 'divine' in its traditional sense and if no longer in force could be taken to elicit the projection of exaltation or generate deep fears and submission to the emptiness that the rejection of a supreme power creates. If so, insistence on a substitute sense of 'God' as such signifies nothing specific except perhaps the great nothing, lacking the power its original referent once had to serve as savior of man. To fill the vacuum in religion, given that Kazantzakis is himself profoundly religious, the idea of God had to be transformed. The poet's new responsibility became a mission to assign meaning to "Nothing," to humanize it and grant it a place in a new poetic hierarchy of values on the ladder of duty.

For Kazantzakis, the poetic gradations of duty emerge through the struggle of creativity but only after the requisite theoretical work has done its part. And now comes the question. What precisely does Kazantzakis, working in the hierarchic manner of the Neoplatonic tradition, hope to save through the process of the new pursuit? The arrow of the Plotinian voyage is targeted to the hypostases of Being, whereas Kazantzakis' own is meant to show the way to the gradations of the soul's discoverable objects: Ego, Ancestor, Humanity, Earth, Universe, and finally God. Throughout the voyage, man and God engage in mutual salvation. Since the concept of God, as Prevelakis once remarked, "implies a new ethic," Kazantzakis came to believe that man conquers death through death and that immortality, properly redefined, requires a different view of God.

The *Spiritual Exercises* opens with a counter-Plotinian statement: "We come from a dark abyss, we end in a dark abyss, and we call the luminous interval life. As we are born the return begins."<sup>5</sup> And further down comes the quasi Platonic note: "Because of this many have cried out: The goal of ephemeral life is immortality."<sup>6</sup>

The salvational process in pursuit of immortality demands climbing the ladder of duty. The first step is for ruling Reason to recognize its limitations, since all it can grasp is ephemeral things, never things of essence. The supreme virtue of Reason is Discipline. Next comes the second duty: to renounce the limits of Reason and accept the ensuing agony. The Heart must do what Reason cannot and heed the duty "to bend down and dig!" The third duty commands the ship of soul to sail towards the abyss. Next comes the gradation of the voyage: Ego, Ancestor, Humanity, Earth. The preparation is now complete for the vision of the divine to follow. Expectedly, the needed virtue is Courage. With the vision of the divine attained, the time is ripe for *praxis*. The action required for the Return is threefold: human to human, human to nature, human to God. The *Spiritual Exercises* (*Salvatores Dei*), ends on a shrill note of two cries and several incantations, the last of which is a blessing: "thrice blessed be those who bear on their shoulders and do not buckle under the great, sublime and terrifying secret that even this ["Lord, you and I are one"] does not exist."

Even if God does not exist, it is man's duty to discover, encounter, reveal and save God through the creative actions conceived as the poetic hierarchies of duty as outlined. The vision was given a poetic form of action in his epic *Odyssey: a Modern Sequel*. At the end of the voyage Odysseus dies on the

iceberg alone in the absolute silence of nothingness. Suddenly, all hierarchies of action vanish in the abyss of inaction. Why, then, the voyage?

### 5. Possible Neoplatonic sources?

The ideas and list of duties in *Spiritual Exercises* are rooted partly in Nietzsche and partly in the socialist messianic vision. However, the undercurrents that feed and support the gradation of values in Kazantzakis' literary text and express his *credo* as a religious poet, have another origin, very old and with a career of its own: Hellenic, Hellenistic, Byzantine. The flight of steps on the Platonic ladder of Eros, the ontological hypostases of Plotinus and the other Neoplatonists, were eventually transformed and selectively assimilated into the body of Christian dogma and given a place in the canon of monastic virtues. They are part of the intellectual background of Ioannis of Klimakos and the thirty-one rungs of his conception of religious duties, if we include the "Logos of the Shepherd," the last rung that links together the dominant virtues of the trinity of faith, hope, and *agape*. There is a similarity between Kazantzakis and Ioannis of Klimakos regarding a negative feature, namely that both share the subordinate role of the logical faculty in the ascending process to the higher hierarchies.

There is no direct evidence that Kazantzakis was intimately acquainted with the moral theology of Ioannis of Klimakos. Additional research will be needed before any questions of influence can be settled. Nevertheless there are certain unmistakable signs of familiarity in the similarities of their corresponding hierarchical conceptions. Both think in terms of religion; Kazantzakis moves in the direction of a ladder of duties while Ioannis of Klimakos has his eyes set on the ascending order of virtues. In Kazantzakis the *askesis* reverses the goal of the Christian saint and instead of the salvation of man the goal becomes the salvation of the divine. Hence the only positive correlation between the two ladders can be seen as a common interest in the religious deontology of strati-fying a mixture of duties and virtues. It is no accident that the structure of the *Spiritual Exercises* makes one think of Ioannis of Klimakos, especially the duty that runs through the thirty-one rungs of virtue in the agonistic process of religious devotion. It is well known that Kazantzakis had shown a strong, even apostolic, interest in a revitalized religious life. His *Spiritual Exercises* testifies to his engaged use of literature combining poetic sensitivity with missionary intensity. While being swept by the currents of his visionary mission to

save the world, he wrote to his friend the Rev. Manolis Papastephanou, in Boston, a letter that foreshadows the idea behind the *Spiritual Exercises*. In the letter, dated September 5, 1922, he stated the following:

The world is rot... We must plant a new one. Never before was the earth more painfully ploughed as it is today. Everything is ready. What is missing? The seed! I feel that I hold the Seed in my hands as though a hand-grenade. Oh, that I could, by jumping over the barrier of logic, throw it on the human fields.<sup>7</sup>

Many readers have found Kazantzakis' poetic inspiration attractive as it shoots its arrow skyward and marks the trail of the hierarchy of duties. Its aesthetic quality remains unalloyed but the substance it contains owes its force to the religious bent of its deontology. And it is so intense, so engaged, that it bears no resemblance to the features of the Platonic Eros; and, if anything, it creates the suspicion that it intentionally runs counter to Ioannis of Klimakos and his virtues of obedience, repentance, memory, death and the joy of mourning. By way of education and early studies Kazantzakis became quite familiar with the literature of Christian ethics. His messianic religiosity shows him determined later to deliver the new gospel of salvation and move the world beyond the horizons of Hellenism and Christianity.

The path that led Kazantzakis to the deontology of the *Spiritual Exercises* winds through many signposts, particularly the ones the Neoplatonists left behind, from Ammonius Sakkas, Plotinus, the Apologetic Fathers, the Athenian School of Proclus down to the theologizing philosophers of Byzantium and all the others who sifted the teachings of the Ancients in order to build the new virtues of Christianity and promote asceticism as the true model of life. At one point the path makes a stop at the doorstep of Ioannis of Klimakos. It takes no leap of the imagination to understand why centuries later Kazantzakis chose the word *askētikē* as the title for his text and projected it as the symbol for his *credo*. It is intended to convey the meaning of a new and different spiritual exercise. Suddenly the teleological theory of virtue the Greeks held in high esteem is pushed aside and replaced with a new deontology demanding the salvation of the divine, where 'God,' to use Kazantzakis expressions, stands for a *diffused, muted, yet omnipresent* divine, awaiting its fulfillment to come as the product of the agonistic human will.

Admittedly, the signs of any direct presence of Neoplatonic ideas in Kazantzakis are not readily detectable; the same holds for Ioannis of Klimakos. This feature makes the tracing of parallel influences in their writings an ardu-

ous if not tenuous task. Regardless of these difficulties and the meandering course of the successive phases of Neoplatonism through the centuries, by the time we come to Kazantzakis' gradations of duties, the issue of influence is hardly less inviting. Comparably, in the case of Ioannis of Klimakos the difficulties remain but not to the point of making us reject all possible historical affinities.<sup>8</sup> It seems rather unlikely that Ioannis of Klimakos' moral theology was not affected by the Neoplatonic religious currents still in force during the sixth century. The language and the terminology alone would suffice to alert us to the conceptual continuities from the Apologetic writers down to the era of monastic theology, i.e., from Alexandria to Mt. Sina. It is a tradition that became firmly established and remained unbroken in the affairs of the Eastern Church. That Kazantzakis was exposed to the monastic ideals and teachings early in his life, just like all Greek intellectuals of the period, makes it feasible to surmise that this is the tradition of religious asceticism with which he was destined to work. As such, it is a tradition that inevitably and quietly touched anyone who tried to fuse together a moral deontology and a vision of poetic gradations, as is the case of Kazantzakis' *Spiritual Exercises*.

While we should not exclude an affinity with the tradition of religious deontology of Ioannis of Klimakos, we must also look elsewhere to explain the originality of Kazantzakis' *Spiritual Exercises*. More specifically, it could be found in the restless mind of modern Europe that had already read into the Greek marbles a questionable purity and disputed the ontic foundations of religious orthodoxy. It is there, in the same modern trends that we must look for the starting point of the other, the novel branch of Neoplatonism that reached Kazantzakis as a radical and worldly poet. The critic who will try to unravel the strands in Kazantzakis' works that have their roots in the diverse shapes that modern Neoplatonism took in the hands of German idealists from Hegel to Nietzsche, and from the latter to Bergson's creative evolution, faces a formidable and complex, though not impossible task.

The paradox of the two paths, as it weaves its way into Kazantzakis' works, allows one to read his texts as contemporary intimations of Plotinus' "flight of the alone to the alone." With this in mind, the interested reader of Kazantzakis' *Report to Greco* (1965) might wish to pay closer attention to two special chapters, both covering an early phase of his life, when he was visiting Mt. Athos and Mt. Sina. Notably, in chapter 18 (on Mt. Athos) Kazantzakis recalls a conversation he once had with a certain Father Ignatius and ended with a question and a query. The question was: "What conclusion must we draw, Father, now that it seems that both [Reason and Heart] are right?" And

the query followed: "I was talking and thinking to myself but didn't say it: New Ten Commandments! New Commandments! But how would this new decalogue arrange the virtues and the vices. I could not think. I would only say and repeat to myself: New decalogue. Great need! Who will give it to us?" Did Kazantzakis, one may ask, ever read carefully and seek the answer in the texts of Ioannis of Klimakos? Is it possible that the theme of the *Spiritual Exercises* was conceived during his stay at Mt. Sina? One can only guess.

I should like to end this address with a comment on the confluence of the two currents of Neoplatonism. By the time the currents reached him as a modern European poet and messianic Cretan there was little left in them to remind him of the Platonic Eros. Beauty as the end of the journey was replaced with the Nothing of the Abyss. Whether unwillingly or acting in innocence of the tradition, Kazantzakis pushed the European consciousness to the edge of the abyss of nihilism, where Nietzsche himself did not dare to look, forcing it to face the implications of the new *hubris*. It took the sharpness of the Cretan Glance, itself hubristic, to indict before the court of Europe's intelligentsia the impasse to which Western Civilization had come: its nihilism. He understood the futility of the modern salvational schemes, including the grandiose promise of Marxism. Absorbed as he was in his cultural and aesthetic stratagem, he turned his back to the prospect of learning from Diotima the duty that Eros had recommended.

The *hubris* is noticeably prevalent and, in a more general way, beyond the refusal to return to the erotic rungs on Diotima's ladder. If the highest duty is to meet the challenge that the spiritual confusion of our times imposes in the face of a multi-faceted cultural impasse and to find a way to end the contemporary crisis, it would be sheer folly to overlook the possibility that the creative renaissance of the Hellenic heritage, the life of reason, might provide a desired starting point. But adopting such a stance would call for more than yet another deontology of an apostolic vision. It would also demand the critical assessment of the Neoplatonic elements that have survived under the guise of poetic hierarchies and gradations projected as salvational devices designed to help humanity overcome the crisis of nihilism. Only thus we may be able to decide whether, in trying to find a solution to the persisting crisis, the Platonic model of Eros or something like it still holds the key to restoring cultural sanity.

Τί λείπει; Ο σπόρος! Νοιώθω στα χέρια μου να κρατώ το Σπόρο έτσι σα χειροβομβίδα. Αχ να μπορούσα πηδώντας το φράχτη της λογικής να τότε ρίξω στ' ανθρώπινα χωράφια.
8. In his article on Ioannis of Klimakos, published in the *Εγκυκλοπαίδεια* *Ήλιος*, vol. Έλλάς, K. Georgoulis has argued that there is no conceivable connection between Neoplatonic ideas and the moral theology of Ioannis of Klimakos.

## Neoplatonic Elements in the Spiritual Life

John Lachs

At a time when the history of philosophy receives less than respectful and conscientious attention from those who consider themselves constructive philosophers, it is good to remember that some of the great thinkers of the past were also masters of the great thoughts or systems of others. George Santayana, in particular, spent countless hours studying the classical works of philosophy.

He studied Plato in exquisite detail and was an avid reader of Aristotle, all of course in Greek. Story has it that, late in his life, an earnest priest tried to bring him back to the Catholic faith of his youth. The priest attempted to quote St. Thomas to show Santayana the error of his ways, but did not quite get the passage right. Santayana helped him out by giving a precise rendition of the text in Latin.

Santayana was no less familiar with the works of the moderns. He read everyone from Descartes to Hegel in the original language of the author and his library contained annotated copies of the works of Bergson, Heidegger and Bertrand Russell, among many others.<sup>1</sup> He read Plotinus and was thoroughly familiar with both major and minor figures in the Neoplatonic tradition. Similarities between his thought and selected elements of Neoplatonism are due not to historical accident but to elective affinity on his part.

I must add at once that, though it is important to see Santayana as in some central respects a Neoplatonic thinker, we cannot rightly say that his complex philosophical views come simply to a repetition of some prior position. In *Platonism and the Spiritual Life*, his most explicit discussion of Plotinus and Plotinian themes in contemporary thought, he specifically limits the scope of his agreement with Neoplatonism. He has two fundamental quarrels with the tradition. He is deeply suspicious of metaphysics, particularly a metaphysics that operates with such dialectical ideas as those of Being, the One, and Mind.

And he charges that the Neoplatonic conception of spirituality is not spiritual enough. I shall discuss the first disagreement immediately, the second only near the end of this essay.

In one sense, of course, Santayana has a metaphysics, or at least an ontology, himself. But his is a characteristically modern, almost postmodern, ironic metaphysics—one that does not claim access to the hidden structures of reality. He thinks that metaphysics of the traditional sort cannot yield results. The nature of reality is best explored by science; philosophy has no alternative to offer to careful empirical investigation. Instead of engaging in metaphysical speculations, he wishes to concentrate on explicating the view of the world tacitly contained in the active life, in the undeniable fact that we act in a multi-centered cosmos deployed in space and time.

He views his ontology as nothing more than a systematic account of the beliefs implicated in what he calls "animal faith," the confidence of the human animal in the independent existence of enduring but manipulable objects. Philosophy can do no more, he thinks, than follow the outlines of common sense. Speculations beyond that amount to "dialectical physics," which is the attempt to gain insight into the real or into what matters by means of the play of words. I wish more of our postmodern colleagues shared his caution about such an enterprise.

Here is the way he puts it himself. "Metaphysics, in the proper sense of the word, is dialectical physics, or an attempt to determine matters of fact by means of logical or moral or rhetorical constructions."<sup>2</sup> Such an enterprise is "neither physical speculation nor pure logic nor honest literature, but...a hybrid of the three, materialising ideal entities, turning harmonies into forces, and dissolving natural things into terms of discourse."<sup>3</sup>

By contrast, Santayana views his own ontology as consisting of categories that capture the features of the world he finds "conspicuously different and worth distinguishing." The ontology is modest, constituting his attempt "to think straight in such terms as are offered to me," in order "to obviate occasions for sophistry by giving to everyday beliefs ■ more accurate and circumspect form."<sup>4</sup> It is, therefore, nothing new: as "a feast of what everybody knows,"<sup>5</sup> it expresses "a certain shrewd orthodoxy which the sentiment and practice of laymen maintain everywhere."<sup>6</sup>

This means that in adopting and adapting the insights of the Neoplatonic tradition, Santayana strips them of their straightforward metaphysical bearing. He takes Plotinus' account of cascading emanations to be a story pointing to potential salvation for humans, rather than as a description of the structure of

existence. But even if the story reveals no facts, it discloses profoundly significant aspects of the human condition, especially the condition of the human spirit or consciousness in a moving and dying world.

In *Platonism and the Spiritual Life*,<sup>7</sup> he criticizes the Neoplatonist William Ralph Inge, Dean of St. Paul's, by arguing that, if we take it literally, Plotinus' view of our distance from the source is severely misleading. Yet he also demonstrates that the same idea, used as a symbol, offers deep insights into our spiritual condition. The rejection of literal and the embrace of symbolic truth is typical of Santayana's approach to the work of philosophy.

We need to distinguish two distinct moments in the development of Santayana's aesthetics. His reflections on the technical problems of aesthetics are contained in his first book, entitled *The Sense of Beauty*.<sup>8</sup> Although Hobbes and other British empiricists lurk in the background, the primary influence on this work is German philosophy. Santayana draws on Schopenhauer's aesthetics and responds to Kant's view of the nature of beauty. A thorough search of the text could perhaps reveal some connections to Neoplatonic sources, but it would be difficult to see these as more than incidental.

His later, ontologically explicit work, which began to see the light of day in 1923 with the publication of *Scepticism and Animal Faith* and continued to develop until the appearance of the fourth volume of *Realms of Being* in 1941,<sup>9</sup> presents an altogether different picture of aesthetics. *The Sense of Beauty* dealt with aesthetics as a set of philosophical problems; the system articulated in *Realms of Being*, by contrast, incorporates the disinterested intuition of beauty as a structuring feature of ultimately satisfying human lives.

That system depicts aesthetic immediacy as the central character of what Santayana calls "the spiritual life," and establishes spirituality as the only way of escaping the concerns, pains and tragedies of the world of change. At this stage of Santayana's work, Neoplatonic influence is ubiquitous. This is the aesthetics I shall discuss.

There is no better place to begin the study of anything Neoplatonic than the contrast between the temporal and the eternal. Santayana finds himself in wholehearted agreement with drawing a sharp distinction between the two and assigns important prerogatives to the eternal. The temporal world, of course, is our home as human animals. Santayana is uncompromising in viewing biological existence as the foundation of all life, including the spirituality that in a special and limited sense takes us beyond it.

Existence as an animal, however, is fraught with frustration and danger; not even momentary victory lifts fear and worry from organisms that must

fight to survive. The insecurity of existence permeates all aspects of life, and the imperfection of time, doling out only passing moments of satisfaction, makes it impossible for us to rest. No animal can thus elude disappointment, aging, and eventual death. None of us, as he puts it, is "too good for extinction,"<sup>10</sup> and in the meantime none can experience more than momentary joy.

Morality cannot help us overcome the structural inadequacy of the processes of life. Good and evil are categories attaching to things and actions as a result of the interest our living psyches, which are physical organisms, take in them. Such assessments are the outcome of caring, and caring is an expression of the vulnerability of animals. "The whole psyche is a burden to herself, a terrible inner compulsion to care, to watch, to pursue, and to possess."<sup>11</sup> Frustration and death are the certain fate of a creature as much in need as this.

So no repose or ultimate satisfaction can come from the tortured life of pursuing the good. Our only hope is to transcend the world of means, of unmeaning processes, and embrace something timeless and perfect. Yet actual transcendence, implying departure from our ambushed bodies, is impossible. Since taking leave of our spatial and temporal stations would mean instant death, not eternal life, we must find the moment of peace within the one life we have been granted.

Transcendence of animal life within the confines of that life is made possible by Santayana's Platonism. Organisms fighting one another in a treacherous world are endowed with consciousness. This sentience, "the total inner difference between being asleep and awake,"<sup>12</sup> serves as an indispensable condition of knowledge.

Santayana adopts Plato's idea that the objects of mind are eternal forms; these forms, which he calls "essences," constitute the realm that appears to consciousness. Each moment of awareness reveals an essence or set of essences and thereby opens immediate access to the eternal. The eternal thus surrounds us, or at least stretches in all directions before the mind, in such a fashion that we can partake of it without effort. We sink into the eternal simply by waking up or by focusing our minds.

Santayana's view of universals differs in three centrally important ways from Plato's. First, although they are objects of thought, essences do not function, for Santayana, as objects of knowledge. Cognition connects the animal to its world, making it possible for it to identify the forces that affect its life.

Knowledge, therefore, is discovery of realities that bear hidden potential, that is, true belief about what exists in the flux. It is "belief in a world of events, and especially of those parts of it which are near the self, tempting or

threatening it."<sup>13</sup> Awareness, by contrast, presents crystalline pictures of eternal actualities that lack potential. The object of knowledge is the dynamic substance of the world, the object of mind is essence in its lifeless and hence indestructible eternity. Santayana summarizes this point by his oft-repeated motto that "nothing given exists," which amounts to the claim that only inexistent forms can be present to consciousness.

Second, essences are, for Santayana, forms of definiteness unlimited in number. Plato found it difficult to decide whether or not hair and dirt had forms corresponding to them. Santayana, by contrast, maintains that every identifiable specificity is an essence. He holds that numbers, the generic forms that define natural kinds, such moral ideas as goodness and justice, all colors and relationships, and even the forms of events are essences.<sup>14</sup> This makes the realm of essence a nested infinity, that is, an infinity consisting of such infinities as the number of numbers and the number and diversity of motions that have, will have and could have taken place during the unending history of the world.

The infinity of essences strips them of power. In its native element, no form has sufficient claim on existence to instantiate itself. In the great Western tradition, the ontological proof of God's reality was supposed to have identified the one and only essence that required or entailed its own existence. As usual, Spinoza held a stronger view, maintaining that all essences containing no contradiction automatically exist.

Santayana rejects the ontological proof and notes that Spinoza can sustain his belief only by refusing to allow the distinction between essence and existence, or by denying that in the final analysis anything touched by time is real at all. In sharp contrast, Santayana thinks that the temporal world is the only existent reality; the realm of essence serves only as an infinite reservoir of passive forms or, as he puts it in a striking image, a costumer's gallery of the clothes in which existence may garb itself.<sup>15</sup>

Third, the infinity of essences removes their moral prerogatives. No essence is any better than another and hence the realm does not constitute a hierarchy cascading down from the Good or the One. The value of essences is extraneous to them, as is their meaning. They are characterized by the principle of self-identity and consist of all and only the features they display.<sup>16</sup>

The essence of a black lab that includes the character of friendliness or trustworthiness is not a better, only a different, essence from that of the same dog characterized by viciousness. Since we can focus on them, there are such essences as Being, the Good, and the One, but there is nothing special about

them, except perhaps their excessive emptiness or generality. Trees create their own structure and animals generate other animals, but generic essences do not construct themselves or beget specific beings. In Santayana's language, they do not belong to "the generative order" of nature.

A consciousness confronted with an infinity of essences has no basis on which to choose among them. Choice is a hallmark of animal life: love and revulsion express the values of organisms. This leads to the shocking, and redeeming, realization that selectivity is of no significance to essence or to pure consciousness. Since essences are inactive, eternal forms, nothing matters to them. And consciousness, or "spirit" as Santayana calls it, is "an impartial readiness"<sup>17</sup> to intuit any universal; it is as happy to contemplate one form as another.

This consideration reveals that inexistent essence and spirit in its purity are for each other; they constitute a natural pair. When essence is instantiated, it becomes a part of the physical world and acquires significance to the struggling animal. And so long as spirit is harnessed to the service of the organism, it cannot take joy in all that comes its way; it suffers the loves and pains of the organic psyche that gives it birth. But spirit set free from servitude to the demands of the body can delight in whatever form it finds. When spirit is permitted to be spiritual and intuition to be pure intuition, the concerns of animality fall away and we taste the peace that passes all understanding. The reward is eternal joy.

This joy is eternal but not everlasting.<sup>18</sup> Animal life is limited: the moment passes and soon we are no more. But eternity is not a quantity to measure. It is activity (*energeia*) in Aristotle's sense, requiring no duration in time.<sup>19</sup> How long the bliss lasts is thus irrelevant. Only its quality matters, and that is unsullied so long as consciousness remains unperurbed by care and retains a clear view of its object. What counts is the moment in which, as Santayana puts it, the ultimate becomes immediate<sup>20</sup> and we rest, if not in the bosom of Abraham, at least in the Elysian fields of transcendent delight.

Spirituality becomes, in this way, the aesthetics of blessedness. The relation between spirit and its objects is clearly aesthetic. It is immediate apprehension that carries joy in the beautiful. The mind leaves its cares behind as it focuses attention on the play of forms. The joy experienced is, as Kant correctly believed, disinterested: as means to nothing further, contemplation and enjoyment constitute an ethereal song.

Since consciousness is involved and forms are apprehended, such mo-

ments display a cognitive, or what Santayana sometimes calls a "synthetic" element. But they do not constitute knowledge in the full sense of the word. They have no external objects and they are not intelligently adaptive to surrounding substances or facts. On the contrary, what makes them special is that they are freed from the demand to adapt to anything—they are unconnected or superfluous to the needs of animal life.

Pure intuitions or moments of liberated, unconcerned consciousness move in this way beyond all preference and valuation. The distinction between good and evil and the drive for perfection express "the subterranean" activities of the animal psyche,<sup>21</sup> its desperate need to distinguish what fosters from what inhibits its life. There is, therefore, nothing spiritual about moral judgments. The latter constitute testimony of the work of selectivity essential for continued life; the former is the selfless—and, dare I say, indiscriminate—embrace of whatever essence may come our way. The latter wants victory over time; the former is content to disappear into the eternal.

This is the source of the second major criticism Santayana levels against the Neoplatonic tradition. In *Platonism and the Spiritual Life*, he repeatedly characterizes the Neoplatonic adherence to exalted values, including the value of spirituality, as "political." He says, for example:

The friends of spirit, in their political capacity, will of course defend those forms of society in which, given their particular race and traditions, spirit may best exist: they will protect it in whatever organs and instruments it may already have appeared, and will take care that it pursues its contemplative life undisturbed in its ancient sanctuaries.<sup>22</sup>

This is an understandable interest in safeguarding what are normally seen as the conditions of spirituality. They are, however, moral and not spiritual concerns about the human good; they express the desires of our psyches to live long and to live well. Such "political zeal, even in the true friends of spirit is not spiritual,"<sup>23</sup> for much as the life of the spirit in us presupposes a flourishing or at least a relatively intact organism, it cannot adopt the aims of that animal without losing its soul.

Santayana's critique of the Neoplatonic tradition comes, then, to the claim that it presents an impure conception of spirituality, mixing true devotion to the eternal with the moral or political desire to protect its sources and to extend its dominion indefinitely into the future. The lesson Santayana wants to teach, instead, is that "spiritual life is not a worship of 'values'," but "a disintoxication

from their influence."<sup>24</sup> This means that the pure intuitions constituting spirituality take no interest even in their own continuance; they are absorbed in a satisfaction that is "free from care, selfless, wholly actual and, in that inward sense, eternal."<sup>25</sup>

Evidently, Santayana does not wish to deny that, as living creatures, we can have a legitimate desire to extend our moments of spirituality for as long as possible. But from the standpoint of the spiritual life, such desires have no standing. Considered from the outside of such experiences, we may well wish for the moments of rapturous union to continue. But from the inside, that is, in those moments when we find ourselves absorbed in a landscape of eternal forms, no desire for anything temporal is possible or proper. If a desire arises, the magic of eternity is shattered; if, amazingly, the magic is sustained, the desire loses its urgency and becomes but another eternal object to contemplate.

We may characterize such all-encompassing absorption in the immediate in a variety of ways. We can speak of it in secular terms as joy in the beauty of all things. But we can also say that it involves the concentration of mind that constitutes the heart of prayer. Santayana refers to it as liberation, as well:<sup>26</sup> it gives us the feeling that we have been set free of the incubus of material existence so we may dwell in eternity.

In *Realm of Spirit*, Santayana also uses the language of union with God, with the One, with the Absolute and with Brahma.<sup>27</sup> Phenomenologically, absorption in the object feels like return to the source or reunification with primordial reality. The outcome is a profound sense of selflessness or a oneness whose vibrant reality cannot be expressed in words.

That the experience Santayana calls to our attention can be captured in the language of metaphysics, aesthetics, religion and poetry suggests that these disciplines converge on key elements in the life of spirit. For Santayana, at least, none of these discourses can be taken as literally true, though all of them constitute useful languages in which we can express vital insights, and remarkably the same ones, into the human condition.

Spirituality does not constitute a life that can serve as an alternative to the one requiring food and air. It does not liberate us in any permanent way from the burdens of existence, nor does it return us to Being or its Source. The experience may feel as though that were happening, and the languages we use to convey or explicate it are marvelous symbolic tools for fixating it. But when all is said and done, what happens is simply that in these moments of calm

consciousness the mind touches the eternal. It does not embrace the One or achieve union with God, though saying so can be a splendid poetic way of describing the event.

These last few comments can be used to measure the true distance between Santayana and Neoplatonists. Although he is in full agreement with the great tradition of Neoplatonism concerning the central significance of eternity for achieving the measure of perfection possible for our finite frame, he cannot accept the metaphysics of Neoplatonism at face value.

Emanation schemes, talk of a unitary source of Being, hierarchical conceptions of reality and the idea that determination is negation strike him as dialectical moves out of touch with the physical reality in which we operate. When it comes to existence, he says again and again, all substance is material, meaning that it is "the physical substance...found in things or between them."<sup>28</sup> If we ever discover the structure of the real world, we will have physics and not metaphysics to thank.

This means that in Santayana's view Neoplatonism as a philosophy of existence or nature will always be wide of the mark. As a philosophy that points the way to salvation, however, it is right on the money. "The Greek naturalists," he says in one place, and in others specifically adds Plotinus,<sup>29</sup> "have been right on the chief issue, the relation of man and of his spirit to the universe."<sup>30</sup> And when we look past the heat of desire and the fierce partialities of animal life, that alone is what truly matters.

Accordingly, it is no small achievement to have developed an understanding of our relation to eternity. None but Plato and his followers were able to do this in the West. Even if we reject their metaphysics, we must accept its spiritual significance for the human race. The enduring worth of Neoplatonism resides not in what it says about the world, but in how it shows us the boundless play of eternity in our lives.

## Notes

## Martin Heidegger on *Mimesis* in Plato and Platonism

Constantinos Proimos

In recent decades we have often heard the complaint that the innumerable aesthetic considerations of and investigations into art and the beautiful have achieved nothing, that they have not helped anyone to gain access to art, that they have contributed virtually nothing to artistic creativity and to a sound appreciation of art. That is certainly true, especially with regard to the kind of thing bandied about today under the name "aesthetics."<sup>1</sup>

These provocative words by Martin Heidegger were pronounced between the years 1936-1940 during his university lectures on Nietzsche. Even today, more than fifty years later, they remind to many of us, similar experiences of complaints against aesthetics, particularly from the part of artists.

The task of this paper is to propose and analyze some of the reasons why Heidegger was prompted to such a fierce condemnation of aesthetics. Through his detailed, long and critical account of Nietzsche and under the shadows of Hegel and Kant, Heidegger attempts in his university lectures, a definite clearing of accounts with Plato and Platonism. This is certainly no small task. For he clearly sees Platonic philosophy as well as Platonism to be endemic to the entire history of Western philosophy. Even if one disagrees with Heidegger's rejection of aesthetics, there can hardly be any disagreement on the fact that Plato by his thought and via his many epigones has set the standards for all discussion of art.

However, Heidegger's problem with aesthetics does not merely reside in the fact that he wants to propose a different understanding of art, beyond the ones proposed by the history of aesthetics. Heidegger's problem is greater

than this: it concerns Plato's basic assumptions about thinking and in particular about truth and its production. Therefore Heidegger's condemnation of aesthetics goes hand in hand with his criticism of truth as representation, whether this is understood as correspondence, *ὁμοίωσις*, imitation, *μίμησις*, or as adequation, *adequatio*. Understanding his problem with aesthetics provides the best access to one of the most fundamental tenets of Heidegger's thinking, namely his notion of truth.

For, according to Heidegger, truth is neither representation of something that exists outside thinking, nor correspondence of the concept to reality. Likewise, truth cannot be measured through adequation or *ὁμοίωσις* between the concept and the real. According to my interpretation of Heidegger, all these traditional models of truth which he rejects, and found in his days not only incorrect but also gravely misleading and ill-fated, depend on *μίμησις*. *Μίμησις*, this major Platonic notion that we may abusively translate as imitation or representation, has the key role in the Platonic theory of ideal forms. Schematically speaking and according to most of the traditional interpretations of Platonism, all reality in Plato and in Neoplatonism strives to imitate or represent the reality of the ideal forms, always unsuccessfully and yet always necessarily. Again schematically speaking, according to Platonism, only the reality of ideal forms is genuinely true, good and beautiful. Now translated to our modern times this thought means that through logic, ethics and aesthetics, humans strive to reach this reality and to imitate it, in the best way they can. Humans set the rules for this imitation via logic, ethics and aesthetics. According to Heidegger's interpretation of the history of metaphysics, logic is "knowledge of *logos*, that is the doctrine of assertion or judgement as the basic form of thought. Logic is knowledge of thinking, of the forms and rules of thought."<sup>2</sup> Ethics is "knowledge of *ethos*, of the inner character of man and of the way it determines his behavior."<sup>3</sup> Aesthetics is *episteme aisthetike*, "knowledge of human behavior with regard to sense, sensation, and feeling, and knowledge of how these are determined."<sup>4</sup> Now it is better understood what metaphysicians mean when they teach that humans strive to imitate the true, good and beautiful reality of ideal forms through logic, ethics and aesthetics. The knowledge which these domains of thinking produce, via their rules and standards, orients the action and comportment of humankind. According to Platonism however, this knowledge is ultimately and permanently determined by the ideal forms and this has of course numerous consequences for thinking and philosophy, which Heidegger attempts to analyze and criticize.

It is easy to infer from our presentation so far, that Heidegger's problem with aesthetics hides in fact a problem with Platonism, in general. For if Platonism accepts as the only valuable reality the reality of the ideal forms, most Platonists despise beings for what they are "on the basis of what (they) should or ought to be."<sup>5</sup> For if truth, goodness and beauty are ultimately placed in the supersensuous realm, all that is grounded in the sensuous is, in the final analysis, opposed or excluded. If art is affirmation of the sensuous<sup>6</sup> then it can be understood why art has traditionally been interpreted to have an inferior role in Plato's *Republic*, in his ideal state. It is also easy to understand why according to Heidegger, Nietzsche became Plato's most notorious and fierce opponent. As he famously put it himself, Nietzsche struggled to overturn Platonism by maintaining in his *Will to Power* that art which espouses the sensuous is worth more than truth which espouses the supersensuous. Nevertheless, overturning the tyranny of Platonism, is not such an easy task as it may seem. For by espousing the sensuous and declaring this reality in which we live as the only possible one, by celebrating the senses and art, we may easily end up in positivism, something of which Nietzsche also, was aware. Positivism, according to Heidegger, accepts as the only standard "what lies before us from the outset, what is constantly placed before us, the *positum*. The latter is what is given in sensation, the sensuous."<sup>7</sup> However, it would be at best naive to limit the scope of reality in what is given to sensation, in what is constantly placed before us. For in such a case, Heidegger argues, we develop a dangerous blindness to all that is nonsensuous, therefore to all tradition, culture and history, whose courses Platonism has so much contributed to shaping.

Thus, truth, according to Heidegger, is neither in Platonism, nor in positivism, at least in these crude versions of them, so far presented.

What is needed is neither abolition of the sensuous nor abolition of the nonsensuous. On the contrary, what must be cast aside is the misinterpretation, the deprecation, of the sensuous, as well as the extravagant elevation of the supersensuous. A path must be cleared for a new interpretation of the sensuous on the basis of a new hierarchy of the sensuous and nonsensuous. The new hierarchy does not simply wish to reverse matters within the old structural order, now reverencing the sensuous and scorning the nonsensuous. It does not wish to put what was at the very bottom on the very top. A new hierarchy and new valuation mean that the ordering *structure* must be changed. To that extent, overturning Platonism must become a twisting free of it.<sup>8</sup>

Ironically, the path that Heidegger himself chooses, in order to twist free of Platonism is a reinterpretation of *mimesis* on the basis of Plato's book X of the *Republic* but also with reference to *Phaedrus* and the *Symposium*. For to twist free of Platonism does not at all mean the impossible and ill-fated wish to dispense with Platonist thinking, writing or heritage. Quite on the contrary, according to Heidegger, twisting free of Platonism means a strong reinterpretation of Platonism. The itinerary which leads Heidegger to this reinterpretation is too long and detailed to be presented here with justice. However, I shall attempt to sketch the main idea and present its results in the best way possible. Interpreting the Greek-Platonic concept of *mimesis*, Heidegger argues:

What is decisive for the Greek-Platonic concept of *mimesis* or imitation is not reproduction or portraiture, not the fact that the painter provides us with the same thing once again; what is decisive is that this is precisely what he cannot do, that he is even less capable than the craftsman of duplicating the same thing. It is therefore wrongheaded to apply to *mimesis* notions of "naturalistic" or "primitivistic" copying and reproducing. Imitation is subordinate production.<sup>8</sup>

As it is well known from Plato's *Republic*, the craftsman of a bed creates it with a view both to the ideal form of the bed as well as with due consideration to the bed's use.<sup>10</sup> However, ultimately, the ideal form of bed remains unknown to him and this is the reason why we have many different constructions of beds, feather beds, water beds etc. Likewise, the painter who paints a bed or the poet who describes one is based on crafted beds. The form of the ideal bed is far from her or him. And we, users of beds, acquire our criteria of judgement when it comes to beds from craftsmen and painters. If moreover, we are well informed and researched we can imagine the form of the ideal bed. However, as long as we live we may come to the point of trying or knowing a bed that is far superior than anything we have tried or known up until then. Thus for us too, the ideal form of bed is ultimately unknown, for no matter how much out of our ways we go to purchase the most ideal bed, for sure there is always going to be a better one. The point here is that whatever access we have to the ideal form of things, this access is necessarily mediated by craftsmen as well as painters, by their subordinate and yet necessary production of things. And if we come across the most ideal form of bed we have ever imagined or tried, then we can infer that all the rest of our previous beds have been inferior to it and that this bed is indeed close to what the ideal bed must be. Then, the fact that we often proclaim "This is a real bed!," "This is truly a

bed!," "This is a true bed!" means, first, that there is truth assigned to the thing, second, that truth pertains to actual things, in general and third, that some actual things, even of the same kind, can be truer than others. When we come across a good bed, at least a better than the one we already have, then something of the ideal form of bed is revealed to us. The better bed is disclosed as closer to the ideal bed and yet prudence and modesty about our possessions and perhaps a little bit of consumerist addiction, dictate that there must always be a better bed, closer to the ideal.

Likewise according to Heidegger truth belongs to things themselves. Or rather some of truth. For some things, even of the same kind are truer than others. Heidegger defines his notion of truth in an earlier essay than the Nietzsche lectures, with the title "Plato's Doctrine of Truth" from 1931/1932. There Heidegger defines truth as unhiddenness. "As unhiddenness truth is a fundamental trait of beings themselves."<sup>11</sup> To the extent that all beings show themselves to us, they emerge from hiddenness, and to this extent such beings are true.

In Greek, unhiddenness is called ἀλήθεια, a word that we translate as "truth"...Originally for the Greeks hiddenness, as an act of self-hiding, permeated the essence of being and thus also determined beings in their presentness and accessibility ("truth"); and that is why the Greek word for what the Romans call "*veritas*" and for what we call "truth" was distinguished by the alpha-privative (ἀ-λήθεια). Truth originally means what has been wrested from hiddenness. Truth is thus a wresting away in each case, in the form of revealing. The hiddenness can be of various kinds: closing off, hiding away, disguising, covering over, masking, dissembling.<sup>12</sup>

To be sure, according to Heidegger, truth does not only belong to things themselves. At the same time that Heidegger discovers truth as ἀλήθεια he also acknowledges truth as ορθότης, the correctness of the gaze, which is equally being developed by the Platonic dialogues. Truth as ορθότης, is "the correctness in apprehending and asserting."<sup>13</sup> Truth as correctness of the gaze "becomes a characteristic of human comportment toward beings"<sup>14</sup> rather than a characteristic of beings themselves. Finally, truth as correctness of the gaze is the representational form of truth, as it concerns the correctness of representation and assertion. This truth which concerns human intellect, finally prevails in the history of metaphysics after Plato and Aristotle. Truth as correctness of representation recurs periodically as *adaequatio* in medieval Scholas-

ticism, notably in the work of Thomas Aquinas, as *veritas* in Descartes' rules, as "the necessary error" in Nietzsche's *Will to Power*. Concomitantly, the essential ambiguity in the works of both Plato and Aristotle between truth as ἀλήθεια and as ὁρθότης is subsequently to their works, lost.<sup>15</sup>

Heidegger aims to retrieve and use this Platonic ambiguity in the determination of the essence of truth in order to criticize and limit the scope of the mimetic model of truth, truth as correctness of representation. The main notion of truth through which he operates is that of ἀλήθεια, that truth which as unhiddenness pertains to things themselves and which is non representational. To the extent that unhiddenness becomes an operating principle of his thinking, Heidegger arrives at some peculiar sort of earth-bound Platonism which is however stripped from the constitutional and traditional roles ascribed to *mimesis* and to the supersensuous realm. Truth as unhiddenness has its opposite in hiddenness. Of course, Heidegger claims, things do not err. They only conceal themselves. Erring in this case belongs to the very constitution of humans and consists of humans turning away from the mystery of things "toward what is readily available, onward from one current thing to the next, passing the mystery by..."<sup>16</sup> Erring is therefore to accept things as they are hidden and not to expose oneself to their unhiddenness. The essence of truth according to Heidegger is freedom and freedom is letting things be. For Heidegger letting things be means engaging with things and caring for them.<sup>17</sup> To what extent this is some sort of Platonism or is a definitive twisting free of Platonism, remains an open question.

In any case, in Plato himself, Heidegger finds the seeds to twist free of Platonism. Twisting free of Platonism for him means to abandon the all dominant mimetic notion of truth, truth as correctness of representation and assertion, in favor of truth as ἀλήθεια, unhiddenness. Furthermore what this means is that Heidegger does not limit the scope of truth in all matters which have to do with intellect and representation. Truth is not solely pertinent to logic but also applies to the individual, social or historical comportment of humans and finally equally concerns their productive activities, the manner in which they create or fabricate things. Heidegger's Hegelianism resonates here. For the neat traditional separation of metaphysics among logic, ethics and aesthetics does not hold in Heidegger's views. Rather, his notion of truth as unhiddenness allows him to consider in an all-encompassing manner all the activities of humankind which were hitherto separated and distinguished.

Heidegger's non mimetic notion of truth has however a particular significance for all reflection on art nowadays. For the mimetic notion of truth which

has been predominant in aesthetics blinds us to the significance of many artworks and artefacts, old and new. The temple of classical Greek antiquity, an example that Heidegger employs in "The Origin of the Work of Art," stands there without being a copy of anything. The historical, political and religious ideas and views it exemplifies do not have a direct formal resemblance with its forms and contours. Certainly the forms and contours of the temple mean historically, politically and religiously, in a way that crystallizes the views and the values of classical Greek antiquity. In fact, the construction of the temple is associated in our memory with everything that the ancient world of classical antiquity was for us. Its truth is one of our few remaining accesses to this world. But its truth depends on how in each historical era, this same temple emerges from hiddenness, how it is discovered and rediscovered and what special significance each historical people attaches to this discovery. Likewise, a crafted thing like a bed has a significance for us today which depends on the rich variety of beds which exist and are available in the market. However, contrary to Plato's assumption a bed's significance and value are not solely inferred from the rich variety of actual beds. For example, a non-existent bed, the bed described by Homer during Ulysses's meeting with Penelope and the event of his recognition by her, directly or indirectly influences the way we see all beds and the special significance we attach to them as symbols of marital love and faith. Even as a subordinate literary production, according to the Platonic doctrine, this bed has an ineffable mark on our memory and may indeed more than any water or feather bed, stand in our imagination as that bed which is closest to the ideal. Furthermore, if we ever hope to get a clue of modern and contemporary art of the 19th and 20th centuries, it is imperative to extend our notion of truth beyond *mimesis*. For as it is broadly known a great deal of modern and contemporary art signifies without representing anything real. Modern and contemporary artworks are rather examples of things in the Heideggerian sense of the term. They have their own truth which relates with aspects of the world in which we live. They reveal this truth and emerge from hiddenness once we let ourselves be exposed to these aspects, once we research them and engage with them. Therefore, it is narrow-minded to restrict artworks to the domains of representation, aesthetics, feeling. Often their significance in terms of these domains is secondary when it is not non-existent. Hence Heidegger's condemnation of aesthetics aims to direct our attention to an alternative non representational, non aesthetic understanding of art which of course stems from his alternative understanding of truth and how this pertains to all things.

Heidegger's non mimetic notion of truth is therefore of great value in order to get an insight in various historical developments of the different arts. Moreover, the insights that Heidegger's notion of truth allows us into the state of the arts are theoretical and political too, exactly in the same way as Plato's inquiry into art in the *Republic*. This is why Heidegger, like the Greeks, locates art between *techne* and *poiesis*. On the one hand, art as *techne* signifies "an ability in the sense of being well versed in something, of a thoroughgoing and therefore masterful know-how."<sup>18</sup> On the other hand, art as *poiesis* means "what is brought forward in a process of bringing-forth, what is produced in production, and the producing itself."<sup>19</sup> Finally art is not irrelevant, according to Heidegger to the Greek μελέτη and ἐπιμέλεια, carefulness of concern.<sup>20</sup> In all cases art for Heidegger is by no means restricted to *mimesis* but is well beyond and above it.

Of course, taking under consideration the dates during which Heidegger developed his thinking on art, truth, and politics during the tumultuous decade of nineteen thirties which also hosted his Nazi period, can be quite troublesome for anyone engaging with his understanding of art. This troublesome consideration of dates is what prompts Philippe Lacoue-Labarthe, one of the most important contemporary critics of Heidegger, to assert that despite the latter's rejection of aesthetics and criticism of *mimesis*, Heidegger falls prey to both of them. First, he falls prey to aesthetics to the extent that he equates art with thought and politics under the rubric of *techne* and thus consciously or unconsciously participates in the general reactionary tendency of the thirties towards the esthetization of politics. Second, Heidegger falls prey to *mimesis* to the extent that his thought offers no resistance to the German obsession during the thirties of restoring in Germany the glory of ancient Greece.<sup>21</sup> Whether one agrees or disagrees with Lacoue-Labarthe, his criticism must indeed be taken seriously but it is well beyond the scope of this paper to examine it in further detail. It is true that a certain degree of caution should always be applied towards the Heideggerian texts of the period which connect art, truth and politics so closely. However, it is also true that the Heideggerian notion of truth provides an important platform on the basis of which we can think constructively and pertinently about art, its ontological status and its theoreticopolitical significance. As it is the case with all great and controversial philosophers, one is free to employ this platform at one's own risk.

Now when it comes to Plato's epigones, Platonists and Neoplatonists, the popular belief prevailing among the historians of philosophy is that Platonists after Plato, lack the complexity and subtlety of the master. Pressing to the

extreme such aspects of the Platonic theory as the distinction between sensuous and supersensuous, the verdict against many Platonists is that they rendered the Platonic philosophy rigid and repressive, much to the expense of its essential ambiguity. Typical example is Nietzsche's views on the matter, according to which the entire Christianity is characterized as "Platonism for the people."<sup>22</sup>

This popular and demeaning belief about Platonism and Neoplatonism should however in each case be carefully scrutinized. For Plotinus, the most celebrated Neoplatonist, it is certainly not the case. Rather on the contrary, the reader of Plotinus's views on beauty discovers aspects which resolve many of the Platonic difficulties in the account of the arts. Plotinus, for example, extends the scope of beauty in the very same way that Heidegger extends the scope of art. For, as it is known, beauty, according to Plotinus need not be restricted to the physical world but equally concerns matters of conduct and intellect.<sup>23</sup> Furthermore, beauty is neither exclusively founded upon the senses, nor does it uniquely depend on symmetry and proportion.<sup>24</sup> Again like Heidegger, Plotinus relates closely beauty and truth. For the latter in the fifth ennead eighth claims that: "We ourselves possess beauty when we are true to our own being; our ugliness is in going over to another order; our self-knowledge, that is to say, is our beauty; in self-ignorance we are ugly."<sup>25</sup> Even Heidegger's criticism of *mimesis* is first articulated in Plotinus' work.

Still the arts are not to be slighted on the ground that they create by imitation of natural objects; for to begin with, these natural objects are themselves imitations: then, we must recognize that they give no bare reproduction of the thing seen but go back to the Reason-Principles from which Nature itself derives, and, furthermore, that much of their work is all their own; they are holders of beauty and add where nature is lacking. Thus Pheidias wrought the Zeus with no model among things of sense but by apprehending what form Zeus must take if he chose to become manifest to sight.<sup>26</sup>

Art therefore, according to Plotinus, is also appraised as a theoreticopolitical activity of a historical character and is endowed with bringing forth truth in the form of Reason-Principles. It is praised and esteemed more than nature, for through art the opportunity is given to behold and admire the idea, infer the intellectual principle from what is less to it and love and desire Being.<sup>27</sup> Contrary to Plato, art, according to Plotinus, is esteemed more than mere craftsmanship. But in this act of irreverence towards his master,

Plotinus is in the good company of Heidegger. The latter indicates his disagreement with Plato through an anecdote:

A statement by Erasmus which has been handed down to us is supposed to characterize the art of the painter Albrecht Dürer. The statement expresses a thought that obviously grew out of a personal conversation which that learned man had with the artist. The statement runs: *ex situ rei unius, non unam speciem sese oculis offerentem exprimit*: by showing a particular thing from any given angle, he, Dürer the painter, brings to the fore not only the single isolated view which offers itself to the eye. Rather we may complete the thought in the following way-by showing any given individual thing as this particular thing, in its singularity, he makes Being itself visible: in a particular hare, the Being of the hare; in a particular animal, the animality. It is clear that Erasmus here is speaking against Plato.<sup>28</sup>

So does Heidegger of course. Therefore both Plotinus and Heidegger conceive of art in a broad manner and in connection to truth, they deem it as the vehicle of truth or the vessel of whatever is highly esteemed in their thinking. Both Plotinus and Heidegger criticize *mimesis* and attempt to limit its scope. Finally, without straightforwardly rejecting *mimesis*, both Plotinus and Heidegger repeat Plato's essential ambiguity on it.

The connection between Heidegger and Plotinus that we attempted to establish a little bit too quickly and schematically, in relation to the great chronological distance separating the two thinkers, testifies to the fact that Platonism has been travelling a long way and surely will continue doing so, during the years to come. However, Platonism's travel itinerary is extremely mutational and in modern times has become increasingly less dependent on *mimesis*. Hence the startling differences of approach and interpretation by historians of philosophy to one and the same body of texts, those of Plato and his epigones. One differing in itself as Heraclitus would put it,<sup>29</sup> perhaps offers the best description of Platonism. The Heraclitean description also indicates something else: that in the times in which we live, longing for the right to difference and pluralism, Platonism which has steadily been the aim of our rage may become an ally of our passion, once again.

## The Neoplatonic Dimensions of Skovoroda's Aesthetic Theory

Roman T. Ciapalo

Whenever I attempt to grapple with one or other of the many *aporiai* in the writings of Hryhorij Skovoroda, the 18th century Ukrainian philosopher, writer, and poet, I turn for inspiration and context to the following words of the historian Dmytro Chzhevskyj:

The figure of Skovoroda stands at the end of the baroque period in the history of Ukrainian letters. Although he himself was part of the culture of the Ukrainian baroque, his period represented a transition to a new form of culture. He was therefore seen by many of his contemporaries as an "archaic," even decadent representative of the past. He stood in the shadow of a growing giant—the rationalism of the Enlightenment. For Skovoroda, however, this new spirit was without a soul, a monstrosity, the child of the devil, goliath, the Beast of the Apocalypse! Thus he could not and would not become part of his times. Although Skovoroda managed during his lifetime to assemble a small circle around himself, for which he had neither the intention nor the will to create any external cohesion, it could never assert itself after his death against that "monster," the spirit of the Enlightenment, and disappeared beneath the waves of those tempestuous times. And with this, Skovoroda himself fell into obscurity.<sup>1</sup>

In recent decades, however, interest in Skovoroda's thought has experienced a renewal. My own interest in his writings is due to several factors, not the least of which is my curiosity about the affinities between his views and ancient Greek thought. So it is to his so-called and often maligned "archaic" roots that I wish to turn in this brief paper in order to see what, if anything, his aesthetic

theory (consisting of his observations on love, beauty, and God) owes to the ancients, in general, and to Neoplatonism, in particular.

Let me begin with some background on the "Ukrainian Socrates," as Skovoroda has frequently been labeled. The historian V.V. Zenkovsky has argued that Skovoroda "was a profound believer, but at the same time he was marked by unusual inner freedom. This inner freedom, his bold, sometimes audacious, flights of thought, stood in opposition to traditional ecclesiastical doctrines; but he feared nothing in his burning desire for truth . . . He had the genuine insight of faith; he was a mystic, in the best sense of the word, but his reason was unconstrained in its free inspiration, and there were often rationalistic features in his thought."<sup>2</sup> Furthermore, "Skovoroda became a philosopher because his religious experiences demanded it; he moved from a Christian consciousness to an understanding of man and the world. In general, Skovoroda allowed nothing to impede the movement of his thought. For him the spirit of freedom was a religious imperative, not the tumult of an incredulous mind."<sup>3</sup> In short, although Skovoroda considered himself a Christian and a member of the Christian Church, he remained a free ecclesiastical thinker, firmly preserving his freedom of thought.

We know from his friend and pupil, Kovalynskyj, in whom we find many parallels to Plotinus' Porphyry, that Skovoroda often experienced a spiritual exaltation, a specific kind of ecstasy. Skovoroda himself wrote to his young friend concerning one such mystical experience as follows:

I went for a walk in the garden. The first sensation which I felt in my heart was a kind of release, a freedom and cheerfulness. . . I felt within myself an extraordinary emotion, which filled me with incomprehensible strength. A momentary but most sweet effusion filled my soul, and everything within me burst into flame. The whole world vanished before me. I was animated by a single feeling of love, peace, eternity. Tears poured from my eyes and suffused a tender harmony through my whole being. . .<sup>4</sup>

One only has to read a sample of Skovoroda's works to be convinced that this is not simply rhetoric, or an imitation of some other mystic, but a genuine and unique experience. And eventually one more thing will become clear: if Skovoroda is to be compared with the mystics, it is not with those of the West—although there is an astonishing similarity between him and Angelus Silesius for example—but with those of the East.<sup>5</sup>

Thus, it is from his religious concentration and his constant immersion in

prayer, that Skovoroda developed a new understanding of life and the world, a new perception of man, and his theory of the ways of knowing. And as a result of his mystical experiences, Skovoroda became haunted by the thought, as he often put it, that "the whole world sleeps"<sup>6</sup> In his writings, many references can be found to this so-called hidden life of the world, a life which can be felt only religiously. Skovoroda felt very deeply the world's "secret sadness" and its "hidden tears." And long before Schopenhauer, who himself felt the sufferings of the world so acutely (under the influence of Hinduism), Skovoroda was constantly concerned with the world's affliction.

And thus, on the basis of this religious feeling Skovoroda came to feel alienated from the world. The life of the world appeared to him as a fundamental duality. The reality of being was different on the surface from what could be found in its depths; and this led Skovoroda to the epistemological dualism central to his philosophy. There was cognition which glided over the surface of being, and there was also cognition "in God." Accordingly, Skovoroda insisted on the psychological priority of sensory knowledge, from which it was necessary to rise to spiritual knowledge. "If you wish to know something truly," he wrote, "look first at the flesh," *i.e.*, at its outward aspect, and you will see there the divine traces which reveal an unknown and secret wisdom. This higher cognition, this beholding of the "divine traces" comes from a spiritual illumination, but is accessible to anyone who can tear himself away from the bondage of an exclusive reliance upon the senses.<sup>7</sup>

Skovoroda, then, seems to argue that the way to this deepened form of contemplation of being is to be found first of all in man's relation to himself. It is our self-knowledge, in its capacity to reveal to us two 'strata' of being, *i.e.*, a spiritual life behind our psychological experiences, that permits us to see everything in this duality of being. "Self-knowledge, therefore, is the beginning of wisdom: 'If you have not measured yourself first,' Skovoroda remarks, 'what benefit will you gain from measuring other creatures?' 'Who can discover the design in the materials of earth and heaven if he has not first been able to look into his own flesh?'"<sup>8</sup>

This thesis is, of course, highly reminiscent of the spirit of Platonism, the recognition of a world of ideas which duplicates being, however imperfectly. What Skovoroda adds is the tendency toward a mystical interpretation of what is revealed to the "spiritual eye"—thus for him "to know oneself and to understand God is a single enterprise."

Let us leave this brief sketch of Skovoroda's epistemology and turn to his anthropology. The problem of man, his nature, his destiny, and the meaning of

his life stood at the very focus of Skovoroda's reflections. The basic concept which Skovoroda analyzed exhaustively in his doctrine of man is the concept of the heart.<sup>9</sup> What is central and essential in man, according to Skovoroda, is his heart. "As a man's heart is, so is he," he wrote.

It is important to remember that according to his principle of "seeing all things double," Skovoroda teaches that in addition to the earthly body, there is a spiritual body, which is mysterious, hidden, and eternal. Accordingly, there are two hearts. Concerning the "spiritual" heart, Skovoroda says that it is "an abyss which embraces and contains all things," but which nothing can contain.<sup>10</sup> In a dramatic and revealing passage, Skovoroda asks,

"What is the heart, if not the soul? What is the soul, if not a bottomless abyss of thought? What is thought, if not the root, the seed and the grain of all our flesh and blood, and of all other appearance? ... Thought is the secret spring of our whole bodily machine."<sup>11</sup>

In thus characterizing the "heart," Skovoroda employs a conception which had come into use (first in mystical, and later in general, literature) from Meister Eckhart: the conception of a "divine spark," which is "buried in man."<sup>12</sup> "Skovoroda asserts that not only is there a 'divine spark' (Eckhart's '*Funklein*') in man, but 'the Holy Spirit is also hidden there.'"<sup>13</sup>

All of this represents quite an original metaphysics of man, with unmistakable echoes of a variety of sources, including to some extent, anthropology of Philo. But, his views are also close to those 18th century doctrines which culminated in the concept of an "unconscious" sphere in man. What is clear when reading Skovoroda is that he is primarily an investigator of human nature, although in his various statements one continually finds echoes of other thinkers.

Thus, we can also find in Skovoroda traces of a Platonic and Neoplatonic anthropology, specifically, of the doctrine of the "erotic" nature of our aspirations. For him, "[t]he heart does not love unless it sees beauty." To this aesthetic formula, which we shall revisit later, is added the doctrine which is basic to Skovoroda's ethics: that we love deeply only what is "akin" to us and precisely because it is akin to us. Skovoroda's ethics thus enjoins obedience to the "secretly inscribed law of human nature."<sup>14</sup> And this, of course, comes very close to the Stoic principle of "living according to nature."

The key to understanding Skovoroda's theory of beauty seem to be to see

it within its broader context, namely, his discussion of love, and it is to this topic that I shall now briefly direct our attention.

What we find in Skovoroda is an understanding of two sorts of love: the lower and the higher, or, as he usually puts it, earthly love and heavenly love. The sources of this view are many: ancient philosophy, medieval philosophy, especially Byzantine humanism, and the philosophical views of the Renaissance period. As he elaborated on the theme of love, what is obvious is that he tried to take into account all of the positions that preceded him. For example, he was particularly close to the Empedoclean conception of Love as a cosmic force, the cause of the production of things, the principle of their unification, and the countervailing power to Strife, the cause of destruction in the sensible world. It is not surprising, then, that Skovoroda once wrote that "everything began with love and love is to be found everywhere." He was also quite sympathetic to the ideas of Epicurus, particularly when the latter spoke of love as a pleasure that is found on both the corporeal and the spiritual levels.

But, on this theme Skovoroda appears to be particularly fond of Plato and the Neoplatonists, especially with regard to his understanding of idealized love, and his treatment of Aphrodite as an explanatory device. In the dialogue entitled "Narcissus: An Essay of Self-Knowledge" we find Skovoroda offering the following admonition:

Do not be puzzled, my soul! All of us are lovers of dust and ashes. Whoever has fallen in love with his incarnate appearance cannot stop chasing after that appearance in all heavenly and earthly domains. But why, really, does he love it? Isn't it because in it he recognizes brightness and pleasure, life, beauty, and strength?

In this dialogue, Skovoroda "asserts that empirical man is a 'shadow' and 'dream' of the true man. In every man the 'Holy Spirit—a divine energy—is concealed,' and often it seems in reading Skovoroda that the 'true' man, whom we all have in our depths, is 'one' in all men."<sup>15</sup> He avoids the charge of pantheism, however, since he does not teach that god is the "substance" in every man. Rather, the above remark refers to the Son of God—the Logos—made flesh and man. The Logos is individual in its being as man, and at the same time it is every man. The "true man" in each of us is the guarantee of our individuality, but it is not to be separated from the "heavenly man," from the Lord.<sup>16</sup>

In his dialogue "Narcissus," written in the style of Ukrainian Baroque, Skovoroda quite precisely and in greater detail paints a picture of the theme of love. In it we find a combination of several ancient Greek and Christian elements. The theme of the ancient myth of Narcissus, the young boy who falls in love with himself and dies as a result of his self-love, is treated in a highly original and surprising manner. Skovoroda comments on this in the prologue to his dialogue as follows:

This is my first-born son. Born in the seventies of this century. Narcissus is both the name of a certain flower and a certain young man. Narcissus—a young man who was gazing upon himself in the mirror of a spring's clear water and has fallen into a deadly love with himself—is an ancient parable from ancient Egyptian theology and of Hebrew history. His image exhorts us to the following: Know yourself! As if he had said: Do you want to be pleased with yourself and fall in love with yourself? Know yourself! Examine yourself vigorously. For how can one fall in love with something that is unknown? Does hay burn without touching fire? So, too, a heart doesn't love without seeing beauty. It is obvious that love is Sophia's daughter. Where wisdom has cast its gaze, there love has been ignited. Self-love is what is truly blissful, and it is saintly, yes, saintly, and it is true, yes, I say, true, and it has acquired and beheld that one beauty and truth: It is standing in your midst, and you are not aware of it.

Even this brief excerpt from Skovoroda's dialogue "Narcissus" helps to illuminate somewhat his notion of love. Skovoroda refers to Narcissus autobiographically as his first-begotten son. He has himself in mind here, that is, a human being who is striving to understand the world. Only by coming to understand the world, and through this, to understand himself as a part of this world, can a human being come to love himself or herself. Obviously, Skovoroda is not talking here about any sort of egoism or egocentrism. Rather, he is putting into practice the Stoic idea of life in accordance with nature. Love, for Skovoroda, is not a passive human state; but an active endeavor, and it is inseparably bound to knowledge and cognition. Thus, it is not an accident that he refers to love as "the daughter of Wisdom." Love, then, is neither unwise nor blind. Rather, when it is joined to wisdom it is among the most sacred of things.

It is here that Skovoroda weaves into his discussion of love yet another theme—beauty. In his view, beauty and love are always found together. He takes great pains to point out that Narcissus fell in love with himself only *after* he saw and experienced his own beauty, the very beauty of the world of nature,

of which he was a part. Narcissus understood perfectly well the fact that he, having emerged from Nature, would eventually return to it, thereby obeying one of the fundamental principles in Skovoroda's theory, namely, that "whatever one falls in love with, one eventually becomes," that love inevitably involves a transformation of profound dimensions.

As he did with love, Skovoroda divides beauty into two kinds: the earthly and the heavenly, drawing from the ancient distinction between Aphrodite-Ourania, representing higher celestial love, and Aphrodite-Gaia (or, more properly, Aphrodite-Pandemos), representing the love of the whole people: lower sexual love, in other words. The heavenly one (Aphrodite-Ourania) can be traced back to the Phoenician queen of heaven, while originally Pandemos was literally the one who embraces the whole people as the common bond and fellow feeling necessary for the existence of any state.<sup>17</sup>

It certainly appears to be the case that Skovoroda was able to appreciate the value of earthly beauty, the beauty of nature, and the sort of love that it evokes. His contemporaries spoke of his love of fine things, that he was very pleased when someone gave him a pipe carved from ivory, and that he appreciated gold ornaments and jewelry. Consequently, we cannot assume that Skovoroda completely denigrated earthly beauty. His remark that "A heart is not moved to love without first seeing beauty" can certainly be applied first to the world of sensible things. Thus, it is not accurate to maintain that Skovoroda was entirely alienated from this world and that his *sole* interest was the ideal world. Even the earlier quotation from his dialogue "Narcissus" rather clearly bears witness to the fact that, for Skovoroda, it is through the material world that the ideal world is reached. Thus, Skovoroda argues, it is only through by observing closely and learning from nature that we can reach beauty, truth, and love.

In addition to what has already been noted, what else, if anything, does Skovoroda's theory of the beautiful have in common with Neoplatonism? Let me turn to Plotinus for a few points of reference, in particular to his first treatise chronologically, I, 6 "On Beauty." As John Dillon, among others, has correctly pointed, but treatise I, 6

...appears at first sight to be an essay on aesthetics, since it begins with a critique of existing theories of beauty, or *to kalon*, but in fact for Plotinus there is no independent sphere of aesthetics, and the subject matter is primarily ethical.<sup>18</sup>

It is here that we find one of several parallels with Skovoroda, for whom it is not so important to discuss aesthetic theory as such, or the merits of competing theories of beauty in themselves, as it is to define the good life, the ideal way for a human being to live.

What is important in Plotinus, of course, is his contention that (I, 6, 2, lines 13-14) things in this world are beautiful because of their participation in form. Using the imagery of the *Symposium* (206d), Plotinus is able to speak of the soul's instinctive recognition of the presence of form in matter as *kalon*, but shrinking away from instances of its imperfect domination of matter as *aischron* (2.I-8). As Dillon later points out,

...this whole essay is shot through with reminiscences of Diotima's speech in the *Symposium*, the central myth of the *Phaedrus* (particularly the regrowing of the wings of the soul, 250eff.), and the Cave Simile of Republic VII. For Plotinus, the role of beauty can only be to recall us to a knowledge of the forms. VII. For Plotinus, the role of beauty can only be to recall us to a knowledge of the forms.<sup>19</sup>

Here, too, fruitful connections to Skovoroda may be noticed, since for him the awareness of earthly beauty is but an initial, quasi-inductive step in a human being's ascent to that true beauty of the divine realm. For Plotinus, the ascent to the forms, namely, to true beauty, is accomplished through the mastery of the virtues, particularly those with kathartic dimensions.

This is ultimately what makes Plotinus' stance on beauty an ethical one, as is obvious from his simultaneously self-centered and other-worldly remarks in chapter 7 (lines 1-12) of treatise I, 6, where he says the following:

So we must ascend again to the Good, which every soul desires. Anyone who has seen it knows what I mean when I say that it is beautiful. It is desired as good, and the desire for it is directed to the good, and the attainment of it is for those who go up to the higher world and are converted and strip off what we put on in our descent—just as for those who go up to celebrations of sacred rites there are purifications, and strippings off of the clothes they wore before, and going up naked; until, passing in the ascent all that is alien to the God, one sees with oneself alone That alone, simple, single and pure, from which all depends and to which all look and are and live and think; for it is the cause of life and mind and being.<sup>20</sup>

What Skovoroda seems to have attempted, and what I have sketched briefly

here is an adaptation of various Neoplatonic themes, along with the Stoic deprecation of the passions and bodily concerns in general, to an essentially Christian theology. So, wherever Plotinus, for example, encourages us to a life of union with our ultimate source, the supreme reality which is sheer unity, Skovoroda substitutes somewhat awkwardly, but largely successfully, the Christian notion of life in Christ.

By way of conclusion I shall return to Skovoroda's view of man's relationship to god. For Skovoroda, it is ultimately through creatures that we can come to understand God's nature and existence. So, as Walter Burkert has noted,

However impious the apotheosis of sexuality may seem in light of the Christian tradition, modern sensibility can nevertheless also appreciate how in the experience of love the loved one and indeed the whole world appears transfigured and joyously intensified, making all else seem insignificant: a tremendous power is revealed, a great deity.<sup>21</sup>

The process of coming to know God, according to Skovoroda, is unusually complex and difficult. It is not surprising, then, that he describes Narcissus as "burning, kindling with the coals of love, bursting with jealousy, rushing about and suffering, and getting heart-sick" until finally he feels God's presence in his heart and finds peace and repose in Him. Thus, the beginning of the journey towards wisdom begins with our attempt to understand God. If one doesn't know God, Skovoroda writes,

he is like a prisoner thrown into a dungeon. What can a person understand in such darkness? The most significant and the first element of wisdom is knowledge of God. I don't see him but I know and believe that he exists. And if I believe, then I am afraid: I am afraid to anger him; I am looking for what pleases him. This is love! Knowledge of God, belief, fear, and love of God - it is all one chain, knowledge in belief, belief in fear, fear in love, love in keeping commandments, and keeping of commandments in love of one's neighbor...

For Skovoroda, those who cannot recognize this higher path are like prisoners living in a dark cave who can never recognize the light of truth. We find here, of course, a classic parallel with the Allegory of the Cave in Plato's *Republic*, where the truth will never become available to those who continue to be imprisoned and paradoxically, those who manage to escape to freedom and by the power of their reason arrive at the beauty of the world, will have no cred-

ibility with the imprisoned. Consequently, if Skovoroda, like Plotinus and other Neoplatonists, disparages earthly life, then it is because it ultimately involves darkness, gloom, ignorance, foolishness; and if he decries people who emphasize only sensory pleasures, it is because they don't care at all about their internal spiritual world, about their higher origins.

For this reason Skovoroda writes with such irony in his dialogue "Narcissus" about the fact that it is the foolish and shallow person who accepts the Sun only as a heavenly body that gives off light and heat, and the fountain (or well-spring) only as a source of drinking water and the origin of brooks, streams, rivers, and seas. Such people do not see that in the sun and in the fountain there exists the very origin of life, they do not see the footprints of divine grace, they do not see in them love and hence genuine beauty. For Skovoroda, only the person of deep spirituality, the person who has turned within and found there the true source of his own beauty and life, is capable of reaching God.

And here we may notice in the thought of Skovoroda yet another echo of Plotinus' ethics. Man's quest for "likeness to God" is for Plotinus, as it is for Skovoroda, the goal of ethical activity. For both thinkers, human actions must be evaluated principally in terms of their ability to assimilate us to the divine. All earthly concerns ultimately must be discarded in the process of purification and ascent to the divine realm. And even though some attention must be paid to the body's needs, both Plotinus' "serious man" (*ho spoudaios*) and Skovoroda's "true Christian" might well be described by the following passage in treatise I. 4 ("On Well-Being"):

He knows its needs, and gives it what he gives it without taking away anything from his own life. His well-being will not be reduced even when fortune goes against him: the good life is still there even so. When his friends and relatives die he knows what death is — as those who die do also, if they are virtuous. Even if the death of friends and relations causes grief, it does not grieve him.<sup>22</sup>

Thus, it is through the achievement of this highest sort of love that a human being becomes wise, indestructible, and unmoved by all unwanted situations and dangers. Such a person is calm with regard to his or her fate and enjoys blessedness. In Skovoroda's own words in "Narcissus,"<sup>23</sup> perfect love, for such an individual

is calmness of soul and the breath of the Holy Spirit. It is like a beautiful garden, soft wind, sweet-smelling flowers, delight in something completed, in which

the imperishable tree of life is forever in bloom. And its fruits are well-wishing, mildness, a calm disposition, gentleness, sincerity, loyalty, safety, pleasure, spiritedness, and the like. For one who has such a soul, peace is with him, and mercy, and eternal joy.

## Neoplatonism and American Aesthetics

Jay Bregman

In his essay "the Poet," Emerson remarks that "men have lost the perception of the instant dependence of form upon soul. There is no doctrine of forms in our (*i.e.* Locke's) philosophy."<sup>1</sup> We are made of noetic stuff, at two or three removes yet ignorant of it. To strengthen his argument, Neoplatonic texts are sprinkled throughout the essay. New and higher beauty is expressed through the poet's announcement and affirming of things; thereby the poet opens phenomenal objects to Platonic Forms. "Being used as a type a *second wonderful value appears in the object far better than its old value*—as the carpenter's stretched cord, if you hold your ear close enough, is musical in the Breeze"<sup>2</sup>—a phrase with Pythagorean overtones. Emerson's "proof text" for this notion is not out of Plato's *Symposium* or any of the *Dialogues*. Nor is it taken from *Enn.* I.6, V.8 or other, where Plotinus discusses Art. Rather it is from Iamblichus: "things more excellent than every image, are expressed through images."<sup>3</sup> For Emerson, referring back to his conception of Nature, "things admit of being used as symbols, because *nature is a symbol* in the whole and in every part."<sup>4</sup> As the soul makes the body (Spenser),<sup>5</sup> so the Universe is the externalization of the soul. Wherever the *life* is, that bursts into appearance around it. "We stand before the secret of the world where Being passes into appearance and Unity into Variety."<sup>6</sup> But we (*i.e.* Locke) treat the physical world as self-existent, rather than dependant on Being.

Then out of Proclus: "The mighty heaven exhibits in its transfigurations, clear images of the splendour of intellectual perceptions, being moved in conjunction with *the unapparent periods of intellectual natures*."<sup>7</sup> The entire cosmos exhibits intellectual perceptions, because its motion is aligned with the intellectual or noetic realm. (thoughts as active rather than as "noetic" objects.) The true poet or artist operates in Imagination, "a very high sort of seeing: ..."

As the eyes of Lyncaeus were said to see through the earth (*Enn.* V.8.4, Thomas Taylor, *Select Works of Plotinus*, contains I.6; V.8: on the pelucid and interpenetrating, all:part:part:all—Noetic realm<sup>8</sup>), so the poet “turns the world to glass...” This only happens “by the intellect *being where and what it sees: by sharing the path or circuit of things through forms, and so making them translucent to others.*”<sup>9</sup> In a celebrated passage from *Nature*, the one he “never quite lived down” Emerson reveals: “I became a transparent eyeball; I am nothing; I see all: the currents of the Universal Being circulate through me.”<sup>10</sup>

Compare Plotinus’ description of intellect in Taylor’s translation: “There, however, everybody is pure, and each inhabitant is, as it were, *an eye*. Nothing likewise is there concealed, or fictitious, but before one can speak to another, the latter knows what the former intended to say.”<sup>11</sup>

The poet properly names things after their appearance or their essence. The daemon or soul which stands over everything is the true *arbiter elegantiae*: “as the form of the thing is reflected by the eye, so the soul of the thing is reflected by a melody.”<sup>12</sup> Indeed, sublime natural wonders, as well as every flower bed, have a pre- or super- existence in “pre-cantations” — apparently ur-Harmonies. Those who have ears to hear these “which sail in the air” can transcribe their notes, as it were, grasping the forms through Nature. The ultimate purpose of Nature is “ascension or the passage of the soul into higher forms.”<sup>13</sup> The poet accompanies the divine aura which breathes through forms. Beyond conscious intellect resides new energy, “as if an intellect doubled on itself.”<sup>14</sup> where the poet abandons himself to the nature of things. He becomes a universal force: “his speech is thunder, his thought is law and his words are universally intelligible...”<sup>15</sup> The poet who speaks adequately, speaks “wildly, or with the flower of the mind.”<sup>16</sup> The *anthos tou nou* is a Procline/Chaldaen conception of super-noetic perception “near the One.” Here, says Emerson, the intellect “released from all service,” takes its direction from celestial life; thus the intellect “inebriated by nectar” is freed from practical activities and the poet sees with the “eyes of Lyncaeus.”<sup>17</sup>

Emerson’s adaptation of the *anthos tou nou* is striking and demonstrates a grasp of the theurgic Neoplatonist privileging of super-noetic intuition; only the “beyond-intellect” allows us to grasp form imaginatively and express it with artistic spontaneity.

In a passage about intimations of the immortality of our essence, Emerson thinks it appears when famous philosophers and company express their characteristic “thing,” e.g., when Socrates in *Charmides*, tells us that the soul is

cured of its maladies by certain incantations, and that these incantations are beautiful reasons,<sup>18</sup> from which temperance is generated in souls. “This occurs also when Proclus calls the universe the “statue of intellect...”<sup>19</sup> Neoplatonic ideas adapted to Emerson’s purposes are central to his conception of the poetic process, poetry and the poet; by extension the artist *per se*. His ideas provided a framework for many subsequent artists and thinkers.

Among American artists influenced by the Transcendentalists is the Hudson River school’s Frederick Church. His “Rainy Season in the Tropics” has been called a “lightscape” in which he “sees through” matter, as Lyncaeus. A religious syncretist, it is likely that Church derived Neoplatonic aesthetic notions from Coleridge. M. Weinstein connects Church’s vision of light to Plotinus and Iamblichus, “who spoke of the soul being known by its light.”<sup>20</sup>

In the late 19th century French Symbolists Neoplatonized Schopenhauer, whose aesthetic theories have much more in common with Plotinus than with Plato: the artist does not imitate, but realizes Form; the work of art is something that wasn’t there before. “We made a singular mixture of Plotinus, of Edgar Poe, of Baudelaire and of Schopenhauer,” wrote M. Denis (Davezac, 258) They shared many key ideas. For Plotinus as for Schopenhauer, “the soul gives the realm of sense something of its own.” “It is Plotinus view of art that the symbolists share: the faith in art’s ability to redeem nature by discovering in phenomena its positive links with Idea” (Davezac, 260). In V.8.2 Plotinus says “... the arts are not to be slighted on the ground that they create by imitation of natural objects, ...we must recognize that they give no bare reproduction of the thing seen but go back to the ideas from which nature derives; and ...that much of their work is all their own; they are holders of beauty and add where nature is lacking;” the arts can transform nature into idea — “for the soul includes a faculty peculiarly addressed to beauty” (I.6.3). “Consider even the case of pictures—those seeing by the bodily sense the production of the art of painting...are deeply stirred by recognizing in the objects depicted to the eyes... the representation of what lies in the Idea and so are called to recollect the truth.” (II.9.16) This is very close to Schopenhauer, who, however, differed from Plotinus in his notion of Art as Temporary Nirvana. For Plotinus, as Fred Schroeder has shown in his eloquent article on Plotinus’s *Symposium* of Plato, “Prophecy and Remembrance in Plotinus,” there is still pain in the recognition of the Beautiful, and the Beautiful is thereby distinguished from the Good.<sup>21</sup> Still, for Schopenhauer the Idea is distinct from the reasoned Concept, always an object of perception... entirely within the sphere of intuition” (Davezac, 261).

Plotinus was often quoted by Symbolist scholars and artists of the 1890's; according to M. Denis, in order to counter Auguste Comte's Positivism, P. Serusier "held forth on the doctrine of Plotinus and the school of Alexandria."

In America, Symbolism had few advocates. Arthur B. Davies painted mythological, almost surreal scenes such as "Full-Orbed Moon," whose luminous female figure under the orb of the moon, suggests mysteries connected with Selene. Elihu Vedder's Symbolist Mythological canvasses, Pre-Raphaelite in style, suggest a Neoplatonic inspired "mysteriosophy." Maurice Prendergast was influenced by the Nabi painters. Among John Singer Sargent's depictions of the evolution of religion for the Boston Public Library, noteworthy is his syncretistic "Astarte," with its mysterious diaphanous forms and "Near Eastern Style Occult Symbols"<sup>22</sup>—it seems to be a "theurgic" image of the goddess providentially bringing harmonic order as an Avatar of Universal Soul.

The American modern artist and sometime expatriate Marsden Hartley was perhaps the real heir of the Symbolist aesthetic. He was influenced by the Transcendentalists and Santayana. His favorite reading included writings of the Christian mystics and Plotinus.<sup>23</sup> An "irreligious mystic," he sought Santayana's realm of essence—pure Being in its infinite implications. This essence was graspable only by intuition. Plotinus was his idea of a true thinker who presented "a modified mysticism through mind processes that suit me perfectly..."<sup>24</sup> I think it must be [that] PLOTINUS HAS REFINED MY MY SENSE OF ESSENCE DOWN TO THE LAST DETAIL..."<sup>25</sup> He adhered to G. de Nerval's doctrine of *correspondences*—Baudelaire's "Foret de Symboles"—in Nature. This symbolist notion implies overtones of Proclus's idea of the universal correspondences of images to archetypes and the *seira* or chains of Being; e.g., "The Good" as Sun of the Intelligible World - Helios-Mithras, the Intellectual god, Visible Helios, Solar Daimons, Solar Heroes, Solar initiates (*Heliodromoi*) the Lion, the Cock, the Heliotrope, the Sunstone.

For Hartley the divine was "NOUS, the fourth dimension"—that which is more than ourselves—the 4th dimension that Cezanne tried to paint, the thing which exists between me and the object.<sup>26</sup> For a Neoplatonist this is "the Idea." His best canvasses, e.g., *Oriental Symphony*—the Kandinsky influenced Indian Fantasy, the quasi-cubist constructions, with their geometric shapes, circles, pyramids and mystic graphic signs, display this sensibility. Gertrude Stein approved of his first "mystical abstractions."

Noteworthy of Hartley's Landscapes of New England and Maine are his views of Mt. Katadhin, where he comes close to achieving the essence of Form through the object—the visible fourth dimension—his *NOUS*: "I know I

have seen God now. The occult connection that is established when one loves nature was complete—and so I felt transported to a visible 4th dimension—and since heaven is...a state of mind. I have been there these past ten days."<sup>27</sup>

Contemporaries of Hartley, the Canadian "Group of Seven," became aware of Plotinus through the perennialist Theosophy of Mme. Blavatsky. Their Transcendentalist landscape canvasses appear as a super-real or symbolic search for the "thing" between painter and object; they attempted to paint the Symbolic Idea, the essence of the North American landscape.

Hilary Armstrong insisted on the importance of the sense of the One and the Beautiful in Nature, almost in the manner of an environmental theologian. For him the poet William Blake, despite his criticisms of Plato and company, remained close to Neoplatonism and W. B. Yeats was a "theurgic neoplatonist."<sup>28</sup> Among the poets who knew Yeats and company, Ezra Pound had a serious interest in Plotinus and Platonic connections with the Eleusinian mysteries, a notion he probably got from Thomas Taylor;<sup>29</sup> also, according to Pound, its medieval and later continuations. Perhaps historically naive, even delusional, Pound's ideas were poetically fruitful.

In Pound's syncretizing of Greek mythology, the Mysteries and Philosophy, Odysseus sets the standard of heroic action in the *Cantos*, the mysteries of Eleusis are connected with the beatific vision: "the beatific vision of the mystic is preceded by darkness and bewilderment equivalent to the darkness and confusion experienced by the initiate at Eleusis." (Surette, 256; cf. Plutarch, "On the Soul" 2).

In canto 98:

no more black shawls in the Piazza  
more *sabello*, for Demeter  
"Ut facias pulchram"...

The black shawls according to Pound, were still worn in his "young" time in Venice, for Demeter (canto 102).

They represent a persistence of Eleusis into modern times, that is of the cult of beauty—*ut facias pulchram*.

In Byzantium, the Eleusinian awareness continued:

"The body is inside" Thus Plotinus  
But Gemisto: "Are Gods by hilaritas,"

Here is Plotinus' notion that body is actually in soul and not vice-versa (Surette, 257).

Aphrodite and Persephone are manifestations of the Nous-the Divine Mind. The former is the seen form par excellence/beatific vision

...Cythera potens, Kythera deina  
no cloud but the Crystal body...

The luminous and/or diaphanous bodies of the gods seem to be based on Iamblichean theurgy. On a more mundane note, Pound records Porphyry account of Plotinus's stomach problems as "Plotinus bellyache..."<sup>30</sup>

Pound's hero, Odysseus is presented as an Eleusinian initiate who could brave both the terrors of the Underworld, and the bed of the goddess—a figure uniting the three major subjects of the poem: the descent, the repeat in history, and "the bust thru from the quotidian to the divine."

The poet also read Eriugena and thought his doctrines significant for the medieval Albigenian heretics, whom he saw as adepts of a pagan cult. He didn't understand the Manichaean issue very well: "Have...the text of Eriugena... Johnny had a nice mind *Omnia quae sunt lumina*." All things which are, are lights—the phrase appears in Pisan Cantos 74, facing the Chinese ideogram for "bright:" "in the light of light is the *virtu/sunt lumina*," said Eriugena (74/429:455) and lower on the same page:

Light tensile immaculata  
the sun's cord unspotted  
*sunt lumina*, said the Oirishman to King Carolus  
*Omnia*  
all things that are are lights

The light is ultimately the light of Eleusis, Pound's synoptic and Neoplatonic tinged Eleusis (Taylor's influence), which persists in the 12th century love cult or religion of Amor and down to modern times; it represents the conquest of beauty leading to revelation.

It is not surprising, then, that Pound was also interested in the Neoplatonic Lichtmetaphysik of the 13th century Oxonian Robert Grosseteste.

C. Terrell has connected Pound with Medieval Latin Platonism;<sup>31</sup> *lux enim*, the primal light of Grosseteste is related to the spiritually charged lights of

Eriugena and Grosseteste's "transitus per plura... diaphana..." is in one place connected with Plotinus:

*Nous* to *ariston autou*  
as light into water compenetrans  
that is *pathema*  
*ouk aphistatai*  
thus Plotinus  
*per plura diafana*

*Nous* and Light are equated. Grosseteste seems to distinguish *lux*, light as simple being, the source, from *lumen*, light as "spiritual body," reflected or radiated light.<sup>32</sup>

Terrell points out, however, that what Plotinus and Grosseteste assumed to be philosophy and/or science, Pound uses as metaphor: Says Pound, "Grosseteste may or may not be scientific but at least his mind gives us a structure..." Sharon Mayer Libera, a student of the Neoplatonic elements in Pound's poetry thinks that Pound's sense of pervasive light is *Nous* and linked with his love of myth (Libera, 355). He is a modern Neoplatonic polytheist:

When is god manifest?  
When the states of mind take form  
When does a man become a god?  
When he enters one of the states of mind

And a theurgic Iamblichean Neoplatonic polytheist at that:

By what characteristics may we know the divine forms?  
By beauty  
And if the presented forms are unbeautiful?  
They are demons.  
If they are grotesque?  
They may be well minded genii. (Libera, 258)

Gods appear formed "to the sense of vision and formlessly to the sense of knowledge"

In Canto 25/119:124, the wise man of Gilgamesh, Napishtim, amid "forms and renewals, gods held in the air, Casting his gods back into the *voûs*."

Reflecting Iamblichus *DM* (Taylor, 125) in his guide to Kulchur's (223) chapter on the Neoplatonics, etc.: "Iamblichus on the fire of the gods, *tou ton theon pyros*, etc., which comes down into a man and produces superior ecstasies, feelings of regained youth, super-youth and so forth." The lines: "Iamblichus light, the souls ascending" appear in a depiction of Egypt in Canto 5/17:21.

Pound's magical gods of mythology-the light imagery of his "magic moments" that break into eternal states of mind is reminiscent of the luminous *plasmata* of Iamblichus. (Libera, 360) Canto 23/107:111 includes the "divine fire" of Iamblichus in a Byzantine Neoplatonic context:

"*Et Omniformis.*" Psellos, "*omnis Intellectus est.*" God's fire. Gemisto:  
Never with this religion

(*El Th* 176: all the Intellectual Forms are both implicit in each other and severally existent)

Will you make men of the Greeks  
But build a wall across Peloponnesus  
And organize, and...  
damn these Egetalian barbarians.

In the Malatesta Cantos, Gemisto, that is, Pletho ambassador to Ferrara, in Florence, because the "pest" is:

...Talking of the war about the temple at Delphos,  
and of POSEIDON, concret Allgemcine...

Pound caps Poseidon, who in Pletho's system corresponds to NOUS, Zeus to the ONE... Milton Anastos, in his classic paper on Pletho's Calendar and Liturgy indicates that for Pletho "Each god has a special province of his own. But all are subordinate to Poseidon, the eldest and most powerful of the children of Zeus" (see also Libera, 372). Pound saw Pletho as a seminal figure in getting Ficino his position as Cosimo de Medici's Neoplatonist translator and in respect of the genealogy of the gods, compared to Pletho, Ficino was perhaps a mere valedictorian.

ὕδωρ

*Hudor et Pax*

Gemisto stemmed all from Neptune  
hence the Rimini Bas-Reliefs

(quasi-pagan temple of Malatesta-where Pletho's remains were moved from Mistra") and in Guide to Kulchur (224-Libera 373): "He (Gemistus) was not a proper polytheist, in this sense: His gods came from Neptune, so that there is a single source of being, aquatic (*udor*, Thales, etc. as you like, or what is the difference)." According to Iamblichus, light reflected in water is also a means of divination.

For Pound, Neoplatonically, the key is Mind, Intellect, perception of beauty to which Mind is specially fitted as if the forms one admires or creates were the thoughts of a greater whole in which one fleetingly participates. The old gods are present in "magic moments" to him who is "ready to look." (Libera, 377).

Since the Transcendentalists and their interest in Thomas Taylor, Hellenic Neoplatonism as such has formed a backdrop to elements in American thought and art. Despite quite literally damning the Absolute, William James, in *The Varieties*, seriously analyzes the Pseudo-Dionysian mystical tradition and counts Neoplatonism as an important strand of mystical thought.<sup>33</sup> In a book praised by James and recently popular, *Cosmic Consciousness*, the Canadian friend of Walt Whitman, the Psychiatrist, Dr. R.M. Bucke placed Plotinus high on the list of those possessing "cosmic consciousness," he tries to analyze his "mystical mentality," albeit from a not clearly reliable source.<sup>34</sup>

We should also remember that Pythagoreanism was also part of the package right along. This is not surprising, given the ancient Neoplatonist idea of the congruence of Neoplatonic and neopythagorean thought. Gregory Shaw has discerned a Pythagorean form of Theurgy in Iamblichus and even in Plotinus. Furthermore, there has been a modern revival of neopythagorean musical thought, music theory, and the practice of music itself. Leonard Bernstein, Derycke Cook, Paul Hindemith, and H. Schenker among others, have argued for a "natural pentatonic scale" as the basis of Western tonality which followed musical law as Pythagoras conceived of it. Rather than an arbitrary convention, they thought, the Western scale has its source in the natural order. (Storr, 52). Bernstein wrote: "I believe that from the Earth emerges a musical poetry which is by the nature of its sources tonal. I believe that these sources cause to exist a phonology of music, which evolves from the universal

known as the harmonic series. And That There Is An Equally Universal Musical Syntax, Which Can Be Codified And Structured in terms of symmetry and repetition." ("The Unanswered Question"—"coda"—Harvard, '73.) He thought all music past, present and future, and of all types and all cultures—"all of it has a common origin in the universal phenomenon of the harmonic series." (Storr, 57, 61).

The innovative 20th century composer Charles Ives in his *Essays Before a Sonata*—a kind of reflection on his Transcendentalist background and intro to his Concord Sonata in four movements: Emerson, Thoreau, Hawthorne. The Alcotts—invokes Plotinus to back up his idea of individual expression—though Plotinus himself would perhaps find this a bit strange. The composer should not be afraid to express himself: "He can remember with Plotinus that in every human soul there is the ray of celestial beauty; and therefore every human outburst may contain a partial ray..."<sup>35</sup> And in another passage: "...each has in some degree creative insight and an interest desire and ability to express it..." in every human soul there is a ray of celestial beauty (Plotinus admits that), and a spark of genius (nobody admits that).<sup>36</sup>

Ives, who considered Thoreau a great composer, if only for the rhythm of his prose, alludes to the natural Pythagoreanism expressed in *Walden's*, "accompanying undulations of celestial music,"<sup>37</sup> and the musical/mystical effect of Concord church bells, "At a distance over the woods the sound acquires a certain vibratory hum, as if the pine needles in the horizon were the strings of a harp... a vibration of the universal lyre."<sup>38</sup> The Transcendentalists read the ancient *Life of Pythagoras* as guides to life. Thoreau was especially attracted to Thomas Taylor's translation of Iamblichus *Life of Pythagoras* and *Pythagoric Sayings* from Stobaeus, especially when they displayed a Thoreau-like simplicity: "It is better to live lying on the the grass, confiding in divinity and yourself, than to lie in a golden bed with perturbation." His view of nature seems at times to be influenced by the theurgic doctrine of correspondences of images to archetypes: the *seira* or "chains" of being on which plants, animals, human souls, daemons and cosmic bodies are "suspended" from higher realities. Hence "the sunflower moves in a circular dance towards the sun... if one could hear the pulsation made by its circuit.. he would perceive a sound... in honor of its kind, such as a plant is capable of..."<sup>39</sup> The Transcendentalist periodical *The Dial* also featured Pythagorean music criticism.

The Pythagorean tradition in music and musical speculation has been revived in the present (see J. Godwin).<sup>40</sup> In *The Pythagorean Plato*, Ernest G. McClain suggests that the number of the "tyrannical nature" in Plato's *Repub-*

lic translates (in the western scale) to the "tritone" most distant from the lowest note on the piano keyboard. In short, approaching the most dissonant interval we can imagine—or better perhaps the tritone may be understood as neither clearly consonant or dissonant and thus pure *apeiron*, indefiniteness—unresolved in any sort of *harmonia*.<sup>41</sup> European Jazz critic and producer J.E. Berendt opens his book, the *World is Sound on a frontespiece* in which a Pythagorizing Plotinus is quoted first: "All music, based upon melody and rhythm, is the earthly representative of heavenly music" Though his major interest is the recent influence on the West of Eastern philosophical and musical ideas, he includes a thorough discussion of speculative music, including modern Pythagoreans such as Marius Schneider, Hans Kayser and Rudolf Haase, as well as Pythagoras and the Pythagorean tradition including Kepler: "This book keeps making the statement that the world is sound. Not: the world is vibration. Of course, one could say that as a well—it is true and everybody says so. But it isn't precise enough. From the standpoint of physics, there billions of different possible vibrations. But the cosmos—the universe—chooses from these billions of possibilities with overwhelming preference for those few thousand vibrations that make harmonic sense (and in the final analysis; that makes musical sense): these translate to the proportions of the overtone scale, the major scale, (and less frequently the minor scale), the Lambdoma and certain church music and Indian ragas."<sup>42</sup> Plato knew the (seven) laws of harmony demonstrated by the Pythagoreans on the monochord (Berendt, 62) and referred to by Plato in the *Timaeus*, in which he recognized that the soul of the world is a musical scale.

One contemporary Platonic, or at least in part Platonic American visionary, who has not been widely recognized as such, is the late Sci/Fi author Philip K. Dick, whose stories "Blade Runner: Do Androids Dream of Electric Sheep?" and "Total Recall" have been made into Hollywood movies. Anyone who has seen these or has read him knows that the author is adept at playing with the perception of appearance and reality. During a conversion experience—to an idiosyncratic "Christian/Gnosis," he experienced a beam of laser-like pink light as "an invasion of my mind by a transcendently rational mind, as if I had been insane all my life and suddenly had become sane."<sup>43</sup> This mind became in his last novel: VALIS standing for *Vast Active Living Intelligence Systems*. (Kinney, 7-8). In addition to these novels he filled notebooks with millions of words, in the manner of a "gnostic." Among his 10 articles, which define "Gnosticism:" "But the Savior (Valis) is here, disincorporate; he restores our memory and gives us knowledge of our true situation and nature. Our real

nature-forgotten but not lost—is that of being fallen or captured bits of the Godhead. His nature—the Savior's—and ours is identical; we are him and he is us. The Creator of this world is irrational and wars against the Savior who camouflages himself and his presence here. He is an invader. Thus it is a secret that he is here, nor do we recognize the irrationality of this world and its frauds: that it lies to us. It is us and the Savior vs. this irrational world."

In order to modify this somewhat bleak picture Dick adds nine amendments, some of them long and with complicated qualifications of his position. *e.g.*, "I say, this world in a more ultimate sense (unglimpsed by the Gnostics) serves a benign purpose: it teaches us and we either learn or we do not. If we solve the moral and epistemological puzzles we get to return to the Godhead from which we came. I say, this world is a maze. We may have built it ourselves (while we were in a higher unfallen state) and entered it voluntarily to test our powers (abilities). However, we have become trapped and so a fail-safe device—the Savior Valis—has automatically gone into action to aid us. And final example, I say, this world is not so much evil as a mystery. What may have originally been conceived by us as a challenge has turned out to be a prison (or trap?). Fortunately we anticipated this: thus the Savior who invades this unreal world (Maze) and restores our memory and knowledge and state is our own selves; the Salvator Salvandus: our supra-temporal disincorporate Original and final Self." (*Gnosis* 13) Here we may think of Emerson in *Nature* perhaps intentionally reflecting the Hermetic myth of the Fall of Primal Man, the Anthropos, saying that man is the dwarf of himself, he used to fill the heavens, but now he fills only a small space, and you get the sense that Philip K. Dick is a sort of Gnostic Transcendentalist—of course "pessimistic" compared to the Transcendentalists "optimistic" visions, if we allow *mutatis mutandis*, for the differences between 19th century Ivy League New England Liberal Unitarian culture and post-1960's San Francisco Bay area Syncretistic "Hippy" culture. There are continuities as well as differences.

A most interesting and easily intelligible example of Dick's convictions about apparent and true reality can be found in his discussion in an interview in which he describes experience in Platonic terms: He is at the assassination of Lincoln. But the assassination ITSELF becomes a stage show in which the furniture and other elements of reality are seen to be what they really are: stage props. And then he perceives the stage where this is going on, as just that, a stage, in a theater building. The building itself is more than the stage and immediately "behind," the backdrop behind the curtains and the stage is some kind of initial darkness that is, however, connected to some higher or greater

Reality. The "show," whether the participants are aware of it or not, is basically a Projection of that Reality onto an apparent stage set. The show was nothing more than a "derivative illusion," of something deeper. Given the scene one assumes that the show is at least in part a representation of human History as well as empirical reality as such. After explaining his vision Dick said that it was *that experience he underwent* that enabled him to understand what Plato was talking about in his "Allegory of the Cave" in the *Republic*.

In his farewell lecture at Yale in 1972 "The Rationality of Mysticism," where he presented his avowed neo-Neoplatonic views J. N. Findlay asserted that mystical art displays "interpenetration," by which he meant something like what Proclus meant in *El.Th.* Prop 103, "Πάντα ἐν πᾶσιν, οἰκείως δὲ ἐν ἑκάστῳ" "All things are in all things, but in each according to its proper nature: for in Being there is life and intelligence; in Life, being and intelligence; in Intelligence, being and life; but each of these exists upon one level intellectually, upon another vitally, and on the third, existentially." Thus according to Findlay, for example, Dante is mystical (and Neoplatonic), Mozart is deeply mystical in "The Magic Flute" and *not* mystical in "Don Giovanni." The implication is that the music *itself* would have to have a feel of "interpenetration" to qualify as mystical, in Findlay's sense.

Plotinus said that "symmetry itself" cannot explain why something is beautiful, else why is a flash of lightning (with no parts) beautiful.<sup>4</sup> He is of course working up to his argument that Beauty is dependent on Form. From another angle, we may add that neither does symmetry make a work of Art "mystical." Hard to define "ways of seeing," "ways of hearing" and "ways of knowing" are somehow more important in this regard.

I have attempted to give some examples of Neoplatonic influences on American art and thought. In addition to the admirable advances to Neoplatonic scholarship achieved in North America, Europe, and other places, especially in the last three odd decades, there has been since the 19th century, a stream of Neoplatonic toned ideas, sometimes flowing underground, that has significantly shaped, from the New England Transcendentalists through certain contemporary thinkers and artists, what has been for the most part an American aesthetic.

## The Role of Aesthetics in Plotinus' Ascent of the Soul

J. Noel Hubler

Although he did not write a single systematic work, Plotinus is nevertheless a systematic thinker. His many treatises reveal themselves as parts of a great systematic understanding. The issues he addresses in metaphysics, physics, logic, and ethics all work together in his systematic vision. Aesthetics are no exception. They form part of his overall system. This in no way diminishes their importance, because aesthetics play a crucial role in the central concern of Plotinus' philosophy: the ascent of the soul to the One.<sup>1</sup>

According to Plotinus, aesthetics both begin and perfect the soul's ascent to the One. The One is the source of all being, intelligence, life, and beauty. It is the soul's ultimate fulfillment, but it is not found external to the soul. Rather the One is found at each soul's core.<sup>2</sup> A true understanding of aesthetics first turns the human soul into itself and begins its ascent. True aesthetics teach the soul that souls are the source of all the beauty in the external world. The world soul creates the beauty of the natural realm, while humans are capable of producing technological beauty. This understanding directs the soul's natural desire for beauty inward. Once drawn into itself, the soul then needs to learn that its core is the One. The trained soul learns to rest in and love the beauty of the One. The aesthetic discovery is the soul's ultimate fulfillment.<sup>3</sup>

The One is the ultimate source of all things. Out of its perfection, the One emanates the divine Intellect. The divine Intellect perfectly contemplates the One and becomes perfected by it. When the Intellect contemplates the One, it comes to its true understanding. The Intellect's perfect understanding is the being of all things. Its understanding is truth itself, which is a unity of knower and known. The Intellect's unity is an image of the unity of the One, but it is

not as perfect in its unity as is the One. Unity in intellection implies a subject/object dichotomy (6.9.2.36). The Intellect must gain its unity through contemplation, rather than being unity itself, as the One is. The One is fully present to itself and requires no intellection in order to present itself to itself (6.9.6.49, 6.5.10.16, 6.7.38.24). It is beyond both intellect and being.<sup>3</sup>

Out of its perfect contemplation, the Intellect emanates Soul. The eternal hypostatic Soul introduces motion into the universe. It produces sensation, nature, and matter, all of which are in motion. The eternal, hypostatic Soul includes the world soul, human and animal souls, and even plant souls as its various species (5.1.1, 4.9.4.15).<sup>4</sup>

Aesthetics play a two-fold role in the ascent of the human soul. 1) They show the soul that it is the source of all external beauty and thus direct it inward and begin the soul's ascent. 2) They lead the soul to discover its true internal beauty which is its core. The soul's core is the One and the One is beauty. We can call the two aesthetics external and internal. External aesthetics begin the ascent of the soul. Internal aesthetics perfect it.

### External aesthetics

Plotinus' aesthetics dramatically depart from his inherited tradition. Plotinus quickly undoes the old Stoic definition of beauty as a "symmetria of parts to each other and to the whole" (1.6.1.21 f.). Plotinus points out that under the Stoic definition, no simples could be beautiful; neither colors nor sounds; neither virtues nor understandings. Neither would the parts themselves be beautiful, because only their composition would make them so. Therefore, the Stoics would have us believe that beautiful things could only be made from ugly parts (1.6.1).

Plotinus does agree that symmetry can make things beautiful (6.7.30.38), but I think it is fair to say that according to Plotinus' theory, symmetry is an imitation of true beauty. True beauty comes in unity and completeness. Symmetry is beautiful because it brings agreeable unity to its parts, but symmetry is merely a likeness of more fundamental unities. Symmetry is posterior to the unity of the forms. The forms are themselves secondary and gain their unity, perfection, and beauty from the One, which is the fount of all being and beauty (1.6.6.25, cf. 5.9.2).

For Plotinus, beauty lies in completeness, perfection, and unity. In the visible world, a beautiful thing is perfect and complete in its form. Its form unifies it and makes it beautiful. Plotinus explains that the form and completeness of the universe make it beautiful,

Things become beautiful because of a cause. Since even now something is beautiful, because it is a whole—for "the whole" names this present thing and its form—and because it controls matter. It controls it if it leaves nothing of it unformed. It leaves something out if any form is lacking, for example an eye or something else (6.7.3.9-13 cf. 1.6.2.22-25).<sup>6</sup>

If a sculptor were to leave out an eye, the statue would lack beauty. It would fall short of its completion and perfection. Likewise, to remove a required part from a sculpture would diminish its beauty, as if one were to knock off David's nose. Leaving matter unformed and chaotic leaves it ugly. It is like the ugliness of a completely untidy room, which lacks the proper order. Form brings completion and unity to matter and makes it beautiful.

Form is beautiful to the extent that it completes and perfects, but form ultimately is merely an image of a greater beauty. The One itself is beautiful in its ultimate, self-sufficient completion and perfection. It is beauty without form, because it is in no way limited by form or by anything else.

The power of all is the crown of beauty, beauty which makes beauty. For it generates beauty and makes it more beautiful by the abundance of the beauty from itself, such that it is the beginning and end of beauty (6.7.32.31-35).

The One is beauty in itself although it has no form, because it is complete and whole in itself and lacks nothing (6.7.10.9, 6.7.23.7). Form is not the ultimate beauty. Ultimately, perfect, complete unity is beauty. Form is only beautiful to the extent it mirrors the unity of the One.

Unity explains the human soul's desire for beauty. According to Plotinus, the soul is reviled by ugliness because an ugly thing is unlike the soul. It is unlike the soul because it lacks form and unity which the soul possesses. By contrast, the soul is drawn to that which is like it and it rejoices in it,

If it sees anything that is of its kind or is a trace of its kind, it rejoices and is excited and comes to itself and it remembers itself and its own (1.6.2.8-11).

Material things are like the soul to the extent that they are informed. Form gives material things unity, akin to the unity of the soul. The soul recognizes that a beautiful thing has form just as it does (1.6.2).

Therefore, external aesthetics begin the soul's ascent. In seeing the beauty in the outside world, the soul is reminded of itself. The beauty of externals reminds the soul of its own unity. Plotinus uses the Platonic term "recollection" to indicate the process by which the soul recognizes its own unity in its appreciation of external beauty (1.6.2, cf. 5.8.2). Plotinus calls the process "recollection" because it draws the soul back to a recognition of the unity from which it originated (5.1.1.27, 5.8.2.46, cf. 2.7.16.48).

The process of recollection is critical, because human souls can be ugly or beautiful. They can have greater or lesser unity. It is evident to Plotinus that ugly souls are governed by passions. They are drawn to the outside world and are enslaved by desires for external, material things. The ugly soul mixes itself with the external world. The debased soul mixes with external evils which the body brings it through pleasures, desires, and fears (6.4.15.32-40). Plotinus borrows his expressions of the soul's sad state from Plato, but Plotinus carries the analysis of the problem deeper than his master. He points out that the soul is ultimately responsible for its own debased condition. It is the agent of its own misery.

This is the evil of a human who has in himself a mob of overpowering pleasures, desires, and fears and who gives himself over to such a mob (6.4.15.32-35).

The soul is the one who gives itself over to the body and makes itself subject to its needs. Thereby, the soul subjects itself to the vicissitudes of the material world. In itself it is impassible from bodily changes, so only the soul's own action can afflict the soul. It suffers from its excess sympathy with the body (1.2.6.27, cf. 1.2.3.16).

By contrast, the beautiful and virtuous soul turns inward. It withdraws from desire for external things and purifies itself. Thereby, it finds the truth within itself and the truth beautifies the soul. It becomes a unity governed by intellect and not by external goods (1.6.5.6).

For its reasoning and activity the soul does not depend upon the body. Intellect grasps things not as they are materially, but as they are in their universal forms. It does not function materially or with a material organ,

He will not err who asserts that the reasoning part of the soul does not need any corporeal organ in order to reason, but has its own operation in purity, so that it can reason purely. It is independent, unmixed with body, and in the first Intellect (5.1.10.13-18).

By turning away from the external material world, the soul comes to know itself as it truly is: independent and pure from the body. Ontologically, the body depends on the soul for its existence, not the soul on the body. The soul can exist and thrive without the body, but the body needs the soul to give it unity, otherwise it decomposes into a myriad of disparate parts. As an immaterial being with immaterial power of reason, the soul functions best when detached from the body (1.6.6).

The soul's inward turn leads the soul to pure understanding, undefiled by sensation,

His own soul must become intellect and must trust and be established upon Intellect, so that what the Intellect sees, it will receive because it has been attentive. Thereby, he must behold the One without adding anything sensible and without receiving anything from sense into the Intellect, but must behold the most pure with a pure intellect and with that which is the first of the Intellect (6.9.3.22-27).

By turning inward the soul becomes like the divine Intellect which contemplates fully, completely, and eternally. The beautiful soul imitates the divine Intellect in self-sufficient contemplation. The divine Intellect needs nothing from the outside, but rests in eternal, perfect contemplation. An ugly soul which spends itself in pursuit of external sensation and activities is most unlike the Intellect.

As it turns inward the soul achieves its true and natural unity. The soul's true actuality lies in self-knowledge. In self-knowledge it achieves happiness (1.5.9.22 ff.) and freedom. It is unhindered by any external forces and is free to contemplate the divine Intellect and the One (5.5.9.14 ff., 6.8.7.1 ff.). It is unified and governed by the Intellect which gives it the light of understanding. The light from the One beautifies the soul,

Since everything is beautified by that which is before the present things [the One] and has light, the Intellect has the luster of noetic activity by which it illuminates nature, while soul has the power to live because the fuller life has come to it (6.7.31.1-4, cf. 1.6.6.25-29).

A true understanding of aesthetics leads the soul to understand souls are the true source of beauty in the external world. Its role in bringing unity to the outside world could even lead someone to mistakenly think that the soul is the One itself.

Therefore, since Soul drives everything into unity by crafting, making, forming, and ordering, must they who consider it say that soul supplies the One and is itself the One? (6.9.1.17-19, cf. 1.6.6.27-29).

Plotinus goes on to affirm that the soul does bring unity to the lower order of matter, but not by being the One itself. It is a dependent and secondary unity.

The world soul, individual human, animal, and plant souls are all species of the eternal, hypostatic Soul. Together they create the visible world and all that is in it. They create matter, sensation, and nature. Thus, they are the immediate sources of all the beauty which is in the world. When the soul understands that souls bring order and beauty to the material realm, it reflects back on its own beauty (5.8.2.40). External aesthetics turn the human soul from the distractions of the outside world and into a life of self-reflection and contemplation (1.3.1.26). The soul begins its ascent by becoming unified and self-sufficient in intellection, which makes it a likeness of intellectual beauty. Nevertheless, the human soul still needs internal aesthetics to become like the One and complete its ascent.

### Internal aesthetics

True contemplation leads the good soul to know itself. In coming to know itself, it knows its own source (6.9.7.33, 6.7.34.12). True philosophical reflection shows the soul that its ultimate source, the One, is beyond understanding. Its source cannot be understood by intellection, because the One, which is the ultimate source of the soul and the Intellect, is beyond any intellectual likeness. It is the cause of intellection, it is not intellection itself (5.4.2). All intellection involves duality of subject and object. As such intellection is a plurality and must be caused by the ultimate unity, the One (5.1.4.27-30).

Therefore, to know the One the soul must transcend both sensation and intellection (5.5.6.18, 6.8.21.25). According to Plotinus this can only happen as the soul attains a rest and a love which transcends intellection in a presence in the One beyond intellection (6.9.4.3, 6.9.8.27). The One cannot be known

sensibly or intellectually because it is beyond all sensible and intellectual images. To know it intellectually is to know it only through an intellectual likeness of the One. Plotinus does admit this kind of knowledge of the One, but it is a knowledge of the One only through its effects, as intellectual likenesses are effects of the One (3.8.11.19, 34). If a person knows the One intellectually, a person knows only its effects and not the One itself. But according to Plotinus, a person can know the One itself (6.7.39.1).

Direct knowledge of the One is possible, because the One is both transcendent and immanent. Many times Plotinus states that the One transcends being (5.1.10.2, 1.7.1.8, 1.8.3.1, 5.1.8.7, 5.5.6.11, 6.6.5.37). It is the source of all beings and as source, it is distinct from any being. It emanates being out of its perfection without diminishing its own perfection in any way. It transcends all its effects.

No being is the One. The sum of all beings do not constitute the One, because it is prior to them all. Yet the One is immanent.<sup>7</sup> Plotinus expresses the transcendence and immanence of the One in a spatial metaphor. Plotinus first explains that immaterial things are not separated by space as are bodies. Rather immaterial things are separated from each other by difference,

They are not divided from each other by place, but by difference and distinction. When difference is not present, the undifferentiated things are present to each other. Therefore, that which has no difference is always present, although sometimes we do not possess it (6.9.8.31-35).

Therefore, if two incorporeals lack a difference, one can be said to be present to the other. In the immediate context, Plotinus does not give any examples of immaterial presence other than the One, but it is useful to consider an example. An isosceles triangle differs from a scalene because it has two equal sides and the scalene has none. But they do not differ from each other in having three sides. Therefore the isosceles triangle is separated from the scalene in virtue of having two equal sides, but the concept of triangle is present in both the scalene and isosceles. They do not differ in this respect. Neither differs from being a triangle.

Plotinus explains a one-way presence whereby the One is present in all, but they are not present in the One, "Therefore that which has no difference is always present, although sometimes we do not possess it." In Plotinus' sense of incorporeal presence, this means that the One does not differ from all things.

although they all differ from it. This is problematic because we usually think of difference and presence as reciprocal relationships. If *x* differs from *y*, then *y* differs from *x*. If *x* is present to *y*, then *y* is present to *x*. But Plotinus argues that among immaterial beings, presence and difference are non-reciprocal and hierarchical. The greater can be present to the lesser, but the lesser may not be present to the greater. Likewise, the lesser may differ from the greater, but the greater may not differ from the lesser.

To see how this works, an example is again useful. We could say that "triangle" is present in the concept of isosceles, but "isosceles" is not present in the concept of triangle. To be isosceles, it must be a triangle, but a triangle is not necessarily isosceles. Isosceles contains the notion triangle, but triangle does not contain the notion of isosceles. Or in Plotinian terms, triangle is present in isosceles, but isosceles is not present in triangle. The greater, more universal term is present in the lesser, more particular term, but not vice versa. Conversely, isosceles differs from triangle, because isosceles introduces a specific difference which triangle does not include. But triangle does not differ from isosceles, because an isosceles is necessarily a triangle.

Plotinus uses this same distinction with regard to the One and all beings. The One is present in all things, because it has no difference. It does not differ from things, because whatever they are they are still unities, or they would not exist (6.9.1.3). To be is to be a unity (6.4.11.18). There is no difference in the One which prevents its presence in any being. But every being contains a specific difference from the One. No being is the One. They all include differences which are not found in the One itself. Whatever they are, they do not attain the perfect unity of the One. They can neither escape the One, nor can they contain the One. Rather the One contains all things (5.5.9.33). The One is present in all, but they are not present in the One.

The soul is also a unity and its unity is the One, although it does not always recognize this. It only recognizes its true unity by leaving behind all plurality. Sensation takes the soul outside itself into the plurality of the outside world. In intellection the soul begins to rest within itself (4.4.23.6), but still a plurality persists. The soul remains in the plurality of subject and object. When it leaves behind sensation and intellection, the soul discovers the unity immanent at its core (1.2.4.21).

To further explicate the immanence of the One, Plotinus relies upon one of his most used illustrations. He compares the One to a point and the universe to a sphere which radiates from the One as its center (5.1.11.7).<sup>8</sup> The whole universe depends upon the One as its point of origin (2.2.2.9). The universe is

the divine Intellect. Being and intellect are co-terminus, so the divine Intellect knows all and is all. The universal sphere contains all beings in the perfect contemplation of the divine Intellect.

Plotinus builds on the illustration by comparing the universal Soul to the sphere as it revolves around the center,

If someone assigns the Good [that is the One] to the center and the Intellect to the unmoved circle, then he will assign the Soul to the moving circle. It is moved by seeking. The Intellect immediately possesses and has received that which is beyond being, while the Soul seeks it. The sphere of the all is moved by that which naturally is sought because it possesses the seeking soul (4.4.16.23-29).

The Soul introduces motion to the cosmos. The Soul moves as it seeks the One. The One is the good which all things naturally seek (6.2.11.26, 1.7.1.5). The Soul introduces motion into the cosmos because it seeks after the One less perfectly than does the Intellect. The soul must seek the One rather than possess it in contemplation as does the divine Intellect. Seeking implies motion, so the seeking soul is a moving image of the intellectual universe.

Plotinus further develops the illustration by comparing individual human souls to circles within the universal sphere,

We come to rest as we join our center to the center of all, just as the centers of the biggest circles join the center of the sphere which contains them (6.9.8.19-22 cf. 6.9.10.16).

The largest circle inscribed on the surface a sphere necessarily has the same center as the sphere. Smaller circles have different centers. To see how this works, imagine slicing a sphere. Each slice produces a circle on the surface of the sphere. If one begins at the edge, one can make a point size slice. As one progresses to the center, the slices become larger and larger, until one reaches the center. At the center, the slice is the largest. After passing the center, the slices get progressively smaller. The largest slice forms a circle co-centric with the sphere.

At its greatest perfection, the soul comes to know its own center as the center of all, it comes to rest in the One as its own center. The soul is only a circle, but it is co-centric with the sphere of the all. The soul's center is its unchanging core (6.8.15.14 ff.). It is the part of the soul that is neither changed by sensation nor even by intellection. The soul only discovers its core by ceas-

ing from intellection and sensation. It then discovers that its unchanging core is the One and comes to rest in a unity with the One.

The soul comes to a unity with the One beyond all intellection.

Since there are not two, the beholder is one with that which is seen. It is no longer that which is seen but is unified with the beholder (6.9.11.4-6).

The soul comes to be one with the One by falling into a rest which transcends all intellection. It leaves behind any subject/object distinction (5.3.5.15). Plotinus describes the soul in the state of rest,

Even he is one and has in himself no difference with himself in any way—he sets nothing in motion. Neither wrath nor desire for another is present in him once he has ascended—neither reason nor any intellection nor himself at all, if one can say this. But he has become as if seized or inspired by quiet in a calm and untrembling stability. He never slips away from his own substance nor revolves around himself, but stands so completely still as if to become stillness itself (6.9.11.6).

The soul has come to complete unity with itself, by becoming still in the source of all. It experiences no more outward movements, but comes to complete rest in its center. It becomes a little unity, fully whole and complete in itself, an image of the One itself (6.9.11.43).

To describe the final ascent of the soul as the ceasing of intellection is to describe it in purely negative terms. Plotinus does not stop there. Plotinus also describe union with the One as the unmeasured love of the soul for the One. The One itself is unmeasured. No measure or limit can be applied to it because there is nothing greater than it. The soul becomes like the One and joins the One in unmeasured love,

The love here is not bounded, because neither is the beloved, but the love of this one would be infinite, so that its beauty is otherwise and is a beauty above beauty (6.7.32.26-29).

The soul which leaves behind all measure found in reason and intellection releases itself in an unbound and unfettered love. Neither ideas nor images bind the soul any longer. Neither forms nor shapes contain it. It finds release into the pure unbound unity and beauty of the One.

The soul's love for the One is unlike that of the lover who pines by the door, outside the beloved's,

This is the lover that stands by the door, present but always outside, seeking the beautiful and is content if he is able thus to share in it. Since the lover here does not receive beauty, but only has it by lying before it. But the One remains in itself and the many lovers of the One. love it entire, and possess it entire thus when they have it (6.5.10.3-8).

Unlike the lover of things below which seeks love external to itself, the lover of the One finds the true beauty within herself. It is a beauty of ultimate completion and unity. That true beauty of the soul is the beauty of the One which the soul discovers at its own core.

In the end, true aesthetics show the soul not just that it is the source of the beauty of the outside world. It also shows the soul that the beauty at its own core is the beauty at the core of all things. Its core is the One. When it discovers the One within itself, it comes to love its beauty.

## Notes

1. Gary Gurtler's study, *Plotinus: The Experience of Unity*, Lang: 1988, shows that Plotinus' psychology and metaphysics work together in a system. Gurtler opposes the common twentieth century view that Plotinus' psychology stands in opposition to his metaphysics. In Blumenthal's terminology, Plotinus' metaphysics are static and eternal, while his psychology is dynamic and changing. See H. J. Blumenthal, *Plotinus' Psychology*, Nijhoff: 1971.  
I agree with Gurtler's results, but try to take them beyond the unity of the Intellect and into the unity of all beings within the One.  
J.M. Rist in *Plotinus: The road to reality*, Cambridge: 1967 argues that aesthetics are of secondary importance in Plotinus' system based upon Plotinus' statements in *Ennead* 5.5.12. There Plotinus argues that the Good is more universal than Beauty because Beauty is accessible only to the sophisticated mind. But as will be seen, Plotinus describes the ascent of the soul to the One as both an approach to the Good and to Beauty. Plotinus describes the One as Goodness and Beauty and it is hard to see how to prioritize one over the other without making the One complex. If they are both the One, then they must be one reality.
2. Gerard O'Daly calls it the "unintellectualizing root of the soul" in *Plotinus' Philosophy of the Self*, Harper and Row: 1973.  
O'Daly's view that the true self is the One is endorsed by A. H. Armstrong in "Form, Individual and Person in Plotinus," *Dionysius* 1, Dec. 1977, 49-68, esp. 59, 65.
3. For background in Plotinus' aesthetics see Gary Gurtler, S. J., "Plotinus and Byzantine Aesthetics," *The Modern Schoolman* 66, May 1989, 275-284.  
F.P. Hager, "Métaphysique et axiologie de l'oeuvre d'art chez Platon et Plotin," *Diotima* 14, 1986, 130-137.  
D.N. Koutras, "The Essence of the Work of Art according to Plotinus," *Diotima* 14, 1986, 147-153.
4. The One does not lack intellection in the sense that it is missing something. It has a greater perfection than intellection. John N. Deck calls it the "superknowledge" of the One in *Nature, Contemplation and the One*, University of Toronto Press: 1967, 17-21. Because greater knowledge comes in greater unity, the One has a "knowledge" as transcendent as its unity.  
Others deny even this sort of knowledge of the One. See O'Daly, *op. cit.*, 92.  
Rist, *op. cit.*, 48, focuses on Plotinus' use of the term *epibole* from which he infers that "The 'knowledge' of the One is by implication wholly different from any other knowledge that we can imagine."
5. For an explanation of the relation of the hypostatic Soul to individual souls as the relation of genus to species, see Gary Gurtler's careful analysis in *Plotinus: The Experience of Unity*, 26-30. See also Deck, *op. cit.*, 32-34.
6. Translations throughout are by the author.

7. Deck, *op. cit.*, 116, expresses the immanence of the One as the "identification of the cause and the effect." He thereby overstates the case, because none of the effects are the One itself. Even though the One is immanent, it still transcends its effects.
8. cf. 6.5.5, 6.8.18.6, 1.7.1.23. Plotinus also uses a circle to illustrate the unity of substance 4.2.1.24 and of the soul 4.2.2.38.

## Creation or Metamorphosis? Plotinus on the Genesis of the World

Panayiota Vassilopoulou

### The Setting

In Chapter Nine of the first treatise 'On Difficulties about the Soul' (*Enneads* IV.3 (27)), Plotinus raises the issue of the relation between soul and body and immediately draws a distinction between two fields of enquiry. On the one hand, there is a set of problems concerning the way in which a particular soul relates to a particular body; on the other hand, there is the issue of the way in which soul as such relates to body in general. Plotinus introduces both problems with the help of the same familiar metaphor: in both cases, the question concerns the way in which the soul "enters" or "penetrates" (εἰσοδος, εἰσκρισις) the body and thus "takes upon itself a bodily nature" (12-3).<sup>1</sup> In the context of this metaphor, the difference between the two problems acquires a temporal dimension: the general problem is presented as the "first communication" (πρώτη κοινωνία) between soul and body, soul's original "passage from bodilessness to any kind of body" (8-9); the particular one concerns the subsequent movements of souls which, already embodied, pass from one body to another.

Given this way of framing of the issue, Plotinus naturally announces his intention to start with the most fundamental problem. At this level of generality, the issue could concern the relation of the soul considered as one of the Hypostases of the Plotinian system with matter as such. This problem is real for Plotinus and has been discussed, by him and his commentators, under the guise of the question of the origin and status of matter.<sup>2</sup> However, as will become apparent in what follows, Plotinus is not concerned here with the status of soul or matter prior to their postulated moment of intercourse. The temporal

formulation of the problem is a way to indicate that what interests him is not the origin of the soul or matter and whatever can be said about their separate existence, but rather the origin, through their interaction, of the embodied soul or the ensouled body of which the sensible universe is made.

It appears thus that the initial question ("How soul comes to be in body"?), when understood with the proper qualifications, is in fact a cosmological question presented in a cosmogonic manner: How are we to understand or explain the existing order of the world through a discussion of its origin? Anyone familiar with Plato will recognise the question animating the *Timaeus*.<sup>3</sup> The observation is corroborated by the way Plotinus proceeds to set up the problem:

With regard to the Soul of the All—because it is perhaps <suitable> (εἰκός),<sup>4</sup> or rather it is necessary to start with it—we must of course consider that the terms 'entry' and 'ensoulment' are used in the discussion for the sake of clear explanation (τῷ λόγῳ ... διδασκαλίας καὶ τοῦ σαφοῦς χάριν). For there never was a time when this universe did not have a soul, or when the body existed in the absence of soul, or when matter was not set in order. But in discussing these things one can consider them apart from each other, because it is legitimate to analyse any kind of composition in thought and language (ἀλλ' ἐπινοῶντα ταῦτα χωρίζοντας αὐτὰ ἀπ' ἀλλήλων τῷ λόγῳ οἷόν τε. ἔξεστι γὰρ ἀναλύειν τῷ λόγῳ καὶ τῇ διανοίᾳ πᾶσαν σύνθεσιν). For the truth is as follows. If body did not exist, soul would not go forth, since there is no place other than body where it is natural for it to be (ὅπου πέφυκεν εἶναι). But if it intends to go forth, it will produce a place for itself (γεννήσει ἑαυτῇ τόπον), and so a body (12-23).

Plotinus' claim about the starting point of the discussion makes clear that his interest is directed at the genesis and order of the sensible world, and not the nature and activity of the various Hypostases. The cosmic soul is distinguished from all the other souls precisely by the fact that it is the creator of the sensible world, the subject of the "first communication" between soul and body in which the "dwellings" of all other individual souls are "prepared;" thus it is indeed the appropriate starting point for an account of the creation of the world in the manner of the *Timaeus*, with the cosmic soul taking over the role of the Platonic Demiurge.<sup>5</sup>

The rest of Plotinus' remarks establish more specific relations with the project of the *Timaeus*. At a first level, they appear as an acknowledgement of Plato's own warning before his description of the construction of the cosmic soul, which in *Timaeus*' account takes place after the creation of the cosmic

body. Plato warns the reader there that the order of the presentation of the activities of the Demiurge may be misleading, since the account, as an *eikos* mythos or logos, shares in the accidental or casual (προστυχόντος) element which characterises human existence and falls short of the desired rigour (34C). However, the problem is more complicated than the issue of the correct genetic order in an account of the creation of the world.

The question concerns initially the adequacy of the set of metaphors which so far has structured the issue. Terms like "εἰσοδος," "ἐμφύχωσις," and the like should not be taken literally because, although used "διδασκαλίας καὶ τοῦ σαφοῦς χάριν," may obscure the issue (or bring to it a deceptive clarity) by these aspects of their metaphoric logic which do not correspond with the reality they are supposed to render comprehensible. A term like 'entrance' brings into play a specific spatio-temporal 'staging' of what is to be thought or explained: A, initially outside B, will be finally inside B. Plotinus concedes that the reflective analysis (ἐπινοῶντα) of a composite structure is allowed or possible (οἷόν τε, ἔξεστι) "in thought and language" and that such an analysis will take the form of a genetic narrative which will establish spatio-temporal relations between the constituent parts of this structure. However, he also warns his readers of the problems associated with the establishment of such spatio-temporal frameworks of analysis.

How are we to understand this warning? First, by examining Plotinus' literal claims in the closing argument of the passage, where the truth is explicitly to be stated. In this argument, in agreement with the starting point of the discussion (the cosmic soul) and the claim that body never existed in the absence of soul, the original synthesis of body and soul is accounted for in terms of the generative capacities of the (pre-existing) soul: body is generated by soul as its place (γεννήσει ἑαυτῇ τόπον). A first correction of the metaphoric framework becomes apparent: the cosmic soul does not 'enter' in a pre-existing body, but generates it. However, this generation can not be conceived, in this context, as an act of 'ordering' of a given material, since, as Plotinus states explicitly, "there never was a time...when matter was not set in order" (17-8).<sup>6</sup> Setting aside the possibility of generation *ex nihilo*, we are forced to conclude that, for Plotinus, the spatio-temporal framework is figurative: the creation of the world is not an event to be presented in this or that, correct or incorrect, order.<sup>7</sup>

The issue is obviously connected with the venerable and vexed question of the literal or figurative interpretation of the *Timaeus*.<sup>8</sup> Our claim that Plotinus' own cosmogony is to be treated figuratively is in agreement with the fact that

Plotinus followed the orthodox Platonic tradition, originating in Xenocrates and Crantor, which understood the account of the *Timaeus* figuratively, "σαφηνείας ἕνεκα διδασκαλικῆς." Within this tradition, he is credited by Proclus with the view "that it is [the world's] compositeness that is [in the *Timaeus*] called 'created', and to this is subsidiary the fact of being generated from an external cause."<sup>9</sup> Plotinus' own clearest statement of his position (although it does not refer explicitly to the creation myth of the *Timaeus*) is the following:

But myths, if they are really going to be myths, must separate in time (μερίζειν χρόνοις) the things of which they tell, and set apart from each other (διαίρειν ἀπ' ἀλλήλων) many realities which are together, but distinct in rank or powers (τάξει δὲ ἢ δυνάμει), at points where rational discussions (λόγοι), also, make generations of things ungenerated, and themselves, too, separate things which are together; the myths, when they have taught us as well as they can, allow the man who has understood them to put together again (συναιπεῖν) that which they have separated (III.5.9.24-29).

This important passage clarifies Plotinus' understanding of the issue in a number of ways. First, it makes clear that the problems we have associated with a mythical genetic presentation of the order of the world cannot disappear in a literal or discursive account, since they are rooted in the nature of thought itself, at least when it turns to examine certain kinds of objects or processes.<sup>10</sup> Moreover, although the narrative primacy granted to the soul in the fictional account can be understood as a device signalling its superior 'rank' within the composite structure of the ordered world, this superiority cannot be translated straightforwardly into ontological relations of dependence between separate entities. In other words, the task of constructing or interpreting an adequate 'creation myth' is exhausted neither by deciding 'who comes first' or 'who is inside,' nor by translating these relations in ontological terms of priority or dependence, between, let us say, intelligible and sensible entities. After the analysis or the narrative has established the proper distinctions and the order of dependence, we are left with the question of "συναιπεῖν," of grasping the reciprocal "ὅμοῦ" of the elements in the composite structure; the primary task is not to show that, e.g., intelligence is prior to necessity, but rather to account for their interaction.

Plotinus' closing argument in the passage we have been discussing above is quite instructive. In Plotinus' system there is certainly no doubt about the

relative 'rank' of soul and matter as separate realities, and this rank is reflected directly in the claim that body is generated by soul. However, in the perspective established by the given composite structure of the world, the body is designated as the place "where it is natural for [soul] to be" (οποῦ πέφυκεν εἶναι). This designation turns body into both a product and a condition of the "coming forth" (προέρχεσθαι) of the soul, and hence, from the point of view of an account of the existence of the world, the body is both 'before' and 'after', 'inside' and 'outside' soul. With this designation, the simple order of dependence between the cause (the soul) and its effect (the body generated by an external cause) becomes a reciprocal determination, since the effect appears as a condition of the activity of the cause that generates it. As a result, what from an external point of view would appear contingent (the soul could or could not create the world at a specific moment) acquires a conditional necessity (if there is to be "going forth" of the soul, there has to be a place) in which, although the primacy of the soul is retained in a genetic account, the unity of the world as a composite structure can be "grasped together."<sup>11</sup>

The passage above, however, apart from legitimising the use of myths in discussing philosophical issues, can be also read as a recipe for writing good or effective myths: a myth about the genesis of a composite reality should be constructed in such a way as to make the "συναιπεῖν" of its elements more easy. We can turn now to the brief cosmogony which follows in our text and see how such a myth would look and how it can be effective.

### A Concise Cosmogony

As we have already said, the creation of the world is fundamentally the generation of the place in which the soul "goes forth." The first of the three images that make up Plotinus' brief cosmogony tries to capture precisely the activity which leads to the emergence of this place out of soul's initial condition of rest. At its core there is an ordinary experience, but Plotinus formulates it in a very peculiar way:

As soul's rest was, so to speak, strengthened in rest itself, ■ great light, we may say, shined forth from it and, in the outermost edge of the fire, there came to be darkness, which the soul saw, since it came into existence [as a substrate], and informed it (τῆς δὲ στάσεως αὐτῆς ἐν αὐτῇ τῇ στάσει οἰονεῖ ῥωσινμένης οἶον πολὺ φῶς ἐκλάμψαν ἐπ' ἄκροις τοῖς ἐσχάτοις τοῦ πυρὸς σκότος

ἐγίνετο, ὅπερ ἰδοῦσα ἡ ψυχὴ, ἐπεὶ περ ὑπέστη, ἐμόρφωσεν αὐτό. For it was not lawful (θεμιτόν) for that which borders (γειτονοῦν) on soul to be without its share of formative principle (λόγος) (23-28).

There are many striking features in this image, all directed to a calculated reversal of our ordinary experience of phenomena of propagation of light. There is, first, a spatio-temporal inversion. While we should normally say that light comes after darkness and takes its place by 'chasing it away,' while darkness perhaps 'resists,' Plotinus asserts that darkness comes into being after the shining forth of light (ἐγίνετο, ὑπέστη, ἐκλάμψαν) as its boundary. More precisely, darkness comes into being when light (for reasons left unclear, but *not* because it encounters darkness) stops at some point: at the border, darkness comes into being as visible darkness, as 'proximate' darkness ready to be seen in the light of the soul and be informed by it.<sup>12</sup>

The process that leads to the generation of darkness is quite peculiar, as evidenced by the complex syntax of the sentence. The centre of the construction is occupied by the clause "σκότος ἐγίνετο," as if the subject of the whole process is darkness, or rather the emergence of darkness, since "σκότος" is not the grammatical subject of an active verb. The central presence of darkness is countered by the fact that "ψυχὴ" is the subject of the only active and transitive verb ("ἐμόρφωσεν") of the entire sentence, which appears at the very end of it. Nevertheless, soul does not initiate explicitly the whole process: the event that precipitates the whole sequence, namely the "shining forth" of light, occurs as a consequence of the strengthening of soul's rest in the intelligible realm and is not presented as an intended action of the soul. Only after the soul 'overflowed,' so to speak, and in the presence of the light of this 'overflowing,' darkness emerged and was seen by the soul, did the soul take an active part. Moreover, we should note that this 'overflowing' is set apart from all the other 'events' in this story, by the fact that "ῥωννυμένης," which sets the temporal framework for the entire sequence, is the only participle in the present tense, and hence not an 'event' but a condition present for the entire sequence of the subsequent events.

The initial act of the cosmic drama is thus an 'event' that cannot be described easily within an ordinary framework; processes that can be described in terms of an interaction between distinct entities occur only at the very end of the whole 'event.' Two points should be particularly noted. First, throughout this whole process, there is a strong sense in which the cosmic soul remains separate and at rest in itself, suffering no alteration or relation, despite

the 'overflow' caused by its 'strengthening.'<sup>13</sup> Second, darkness can be considered neither as intentionally generated by the soul (it comes into being as a side-effect of its 'strengthening' and 'overflowing'), nor as an effect of the activity of the soul in any normal sense (the proper effect of light is to enlighten); moreover, it is not merely encountered by the soul as an alien element (since it is soul's light that brings it into existence and makes it visible, by stopping at a certain point).<sup>14</sup> Thus the notion of proximity or neighbourhood (γειτονοῦν), which Plotinus introduces in order to account for the initial affinity between light and darkness which allows the soul to fulfil its function as a spontaneous transmitter of λόγος (like a diffusion process through a semi-permeable membrane) falls equally and undecidedly between spatial contiguity and genetic resemblance: on the one hand, darkness 'occupies' a certain place, it happens to be there close to light; on the other, it comes into being by the light of the soul as its boundary.<sup>15</sup>

We should make a final note about the only intentional action in the image, namely soul's "ἐμόρφωσεν." Plotinus stresses, in almost paradoxical terms, its close connection with vision: the soul "ἰδοῦσα" (in seeing, by seeing, after seeing) darkness, informed it. This formulation should be juxtaposed with the way Plotinus describes elsewhere the process of 'information,' particularly the 'information' of matter. On these occasions, the activity of 'information' is described as the 'covering up,' the 'concealment,' the 'hiding' (περιτίθεμεν, κρυφθεῖσαν) of matter beneath form.<sup>16</sup> We may ask then: What exactly does the soul see? Does it ever see matter itself? Or does it always see 'informed' (i.e., 'hidden') matter and thus encounters only projections of itself?

At this stage, the soul has generated the place of its "going forth." In this clearing of luminous darkness,

There came into being (γενόμενος) something like a beautiful and richly various house which was not cut off (ἀπετμήθη) from its maker (πεποιηκότος), but he did not give it a share (ἐκοίνωσεν) of himself either: he considered it all, everywhere, worth a care (ἐπιμελείας) which conduces to its very being and excellence (τῷ εἶναι καὶ τῷ καλῷ) (as far as it can participate in being) but does him no harm in his presiding over it, for he rules it while abiding above (ἄνω γὰρ μένων ἐπιστατεῖ) (29-35).

The transition from the first image to the second is really unexpected. In the original the effect is more pronounced since the innocuous "γενόμενος," which

stands in the very beginning, has a double function: looking backward, it seems to describe the outcome of "ἐμὸρρωσεν;" looking forward, it introduces us to the new image.

If we set aside this transition, we are temporarily on rather familiar Platonic ground, since the motivation behind this image and the role it plays appear easily recognisable. On the one hand, Plotinus has to account for the rich diversity and order of the sensible world considered as a whole and thus he has to invoke the image of a more complicated and intentional process than the mere propagation of light: the building of a house is a paradigmatic case of making a 'total' and complex artefact. On the other hand, he has to make clear both the transcendent status and the goodness of the maker and the dependent status and beauty of the creation. However, we should note that Plotinus passes over in silence the most salient points of the metaphor of building, the aspects which, after Plato's *Timaeus*, we would expect him to elaborate. As far as the motivation of the maker is concerned, Plotinus notes his general resolve to make the house as real and beautiful as possible. But the rational or technical aspect of building (the laying out of the plan, the determination of the objectives and the steps necessary for their realisation, the choice of the proper materials, the final execution) is never mentioned: the activity of building itself simply disappears in the gap of the transition between the first and the second image and there is nothing in this image to correct the metaphor of instant diffusion or imprinting carried over from the previous image.<sup>17</sup>

The transition between the second and the third image is punctuated with two remarks, one drawing the moral of the second image and the other announcing the claim that will be illustrated by the third image. Plotinus has depicted a world created and "mastered" (κρατούμενος) (36) by a soul which remains separate and external to it; the time has now come to show how this world, once created, does not remain a dead artefact, how "soul makes alive all the other things which do not live of themselves, and makes them live the sort of life by which it lives itself" (10.37-8):

[The house] lies (κεῖται) in soul which bears it up (ἀνεχούση) and nothing is without a share of soul. It is as if a net immersed (or soaked) in the waters was alive,<sup>18</sup> but unable to make its own that in which it is (αὐτοῦ ποιεῖσθαι ἐν ᾧ ἐστίν). The sea is already spread out (ἐκτεινομένης) and the net spreads with it (συνεκτείνεται), as far as it can; for no one of its parts can be anywhere else than where it lies (κεῖται) (36-43).

With this final and vivid image, we return to the imagery of natural elements with which we started. There are three points that we should particularly note here. First, Plotinus' insistence that the (informed) darkness-house-net is contained in soul or, rather, passively lies in it and extends with it as far as it can in the already spread-out soul. This claim raises again the issue of the proper spatial imaging of the relation between body and soul; the image of the net, which apparently contains and delimits what actually contains and permeates it, is a successful metaphor for the vexed dialectic of the 'inside-outside' we have already encountered.<sup>19</sup> Second, there is the aspect of movement, which in this context stands as a metaphor of life. The image of the net, which by being imperceptibly pushed by the sea which carries it, follows smoothly and passively the movement of sea and, on account of its agility, gives the appearance of being alive and determining its own effervescent movement on the inert background of the sea, is a perfect physical analogue of an animistic universe, even if it runs counter to the intuition that the soul directs things 'from the inside'. Finally, we should note that for the first time we learn something about the intentions and capacities of the body, which is thus personified at the very end of the account. The reference (οὐ δυνάμενον δὲ αὐτοῦ ποιεῖσθαι ἐν ᾧ ἐστίν) is formulated as a direct contrast with the creative capacities of the soul (the image follows the metaphoric logic of 'ποιεῖν' = 'περιτιθέναι' we have already noted) and captures the agonising and precarious nature of the life that the body lives: sustained almost indifferently in life by the soul, it is incapable of securing this life, which may slip away at any minute, as its own.

At this point, where the initial metaphor has been completely reversed and the 'entering' of the soul into the body has become the 'immersing' of the body into the soul, Plotinus' brief cosmogony ends. Before we move to the concluding section to discuss the character of this account, a few additional remarks are in place. In accordance with Plotinus' understanding of the function of creation myths, the next chapter starts with the following advice:

Having then heard this, we must, going back again to that which is always such, grasp all as existing simultaneously (ἐπὶ τὸ ἀεὶ οὕτως ἐλθόντας ὁμοῦ λαβεῖν πάντα ὄντα) (10.1-2).

Presumably in order to help us to accomplish this task, Plotinus offers a concise reformulation of his cosmogony, in which the three consecutive images of

his account are replaced with three contiguous (= simultaneously existing) 'parts' of the same image:

so here there is soul always static, or the first, then the next in order, like the last gleams of the light of a fire (ὥς πυρὸς ἔσχατα); afterwards the first coming from this last gleam is thought of a shadow of fire (νοουμένου πυρὸς σκιάς), and then this at the same time is thought of as illuminated (ἐπιφωτιζομένου), so that it is as if form was diffused over what is cast upon soul, which at first was altogether obscure (ὥστε οἷον εἶδος ἐπιθεῖν τῷ ἐπιβληθέντι πρῶτῳ γενομένῳ παντάπασιν ἀμυδρῷ) (10.5-10).

This image looks like a static snapshot of the first image of Plotinus' cosmogony, from which all the complicated temporal relations have been taken away. It can thus be considered as Plotinus' effort to undermine or even abolish altogether the temporal order of his account, in order to make clear that this order is only for the sake of "explanation." Alternatively, we may consider this image as a description of the composite structure of the sensible world in its final and permanent state, after everything that an account of the creation of the world may include has taken place. The spatial determinations (πῦρ-πυρὸς ἔσχατα-πυρὸς σκιά) can be thus considered as indexes of the differences "τάξει δὲ ἢ δυνάμεσι" of the various components of the composite structure. We should note, however, that Plotinus cannot abolish all temporal determinations: the presence and the function of matter (the 'information' of which is the act of creation) can be grasped only with the help of a temporal differentiation between the πρῶτῳ γενομένῳ παντάπασιν ἀμυδρῷ, and the πυρὸς σκιά which unavoidably gives a temporal colouring to the otherwise spatial ἐπιφωτιζομένου, ἐπιθεῖν, ἐπιβληθέντι.<sup>20</sup>

In the context of this synoptic image, a note should be also made about the expression πυρὸς σκιά, which presumably designates the status of the sensible world.<sup>21</sup> The word "σκιά" is repeatedly used by Plato in the *Republic* for similar purposes (e.g., 500A, 515D, 517D, 532C) and the expression "τὰς σκιάς τὰς ὑπὸ τοῦ πυρός" occurs in the story of the cave (515A). In the context of Plotinus' account, the genitive of "πυρός" seems to range over the entire spectrum of possible meanings: the shadow which emerges at the border of light as its privation, the shadow as an attenuated form of light, the shadow as a dim reflection of light. What is made clear, however, in the passage quoted above is, first, that the σκότος with which the soul comes into contact is 'always already' visible in the light of the soul and, second, that the

final product, the sensible world, reflects back, even in an attenuated way, the light it receives. Both points have important consequences, which cannot be pursued here. The only thing we should note, in the perspective of the creation story, is that during its entire creative activity, the soul, in its movement from πῦρ to πυρὸς ἔσχατα and πυρὸς σκιά, appears not to come into (direct) contact with something alien to itself, the "altogether obscure" or the "σκότος ὕλης" (see n.20 above). And this is as it should be, if we take seriously the literal claim that "there never was a time ... when matter was not set in order" (17-8).

### Some Conclusions

Now that we have explored Plotinus' brief cosmogony, we may draw a few general conclusions. We saw that Plotinus followed the precedent set by Plato and responded to the issue of the order of the world with a creation story. The scale and the degree of elaboration of the two projects are of course very different; however, a broad comparison between the two will allow us to identify, rather briefly, the special character of Plotinus' enterprise and to determine the reasons which motivate it.

The myth of the *Timaeus* does not claim for itself the validity of a true account, always in all respects self-consistent and perfectly exact. However, Plato's intention was to create a coherent narrative whole, which places the 'events' of creation in a well-structured temporal order and unfolds in reasonably or plausibly connected steps.<sup>22</sup> From a literary point of view, the story of the *Timaeus* can be regarded as a piece of poetic art composed in a way which satisfies the most important conditions of successful poetry set by Aristotle in the *Poetics*.<sup>23</sup> The dramatic content of the myth is a mimesis of the actions of the Demiurge, whose well-defined character is substantiated in his actions. The story is obviously the mimesis of an important action (the making of the world), which is completed by events skilfully arranged by the most competent creator (whose rationality guarantees that nothing in the narrative is idiosyncratic or eccentric).

The presentation of events is based on the Homeric technique of beginning in medias res: presenting first the "works of reason," Plato opens a parenthesis in order to deal with "what comes about of necessity," and ends his story with a description of "the co-operation of reason and necessity."<sup>24</sup> This narrative device (in the temporal order established by the *Timaeus* itself neces-

sity ought to have been presented first) enables Plato to attain maximum dramatic intelligibility, since a fully personified creative force is established first and all the other elements are incorporated in the story by direct reference to this single agent<sup>25</sup>. In this way, the dramatic interest is concentrated on the actions of the Demiurge, which in a natural manner succeed each other. The plot, the "soul" of tragedy according to Aristotle, is thus constituted by a specific set of actions and their internal relations (which correspond to the complex structure of the world they bring about): the internal disposition or any irrelevant action of the characters involved in the story is not allowed to interfere with this plot.<sup>26</sup>

In the perspective of Plato's practice and Aristotle's theory, our story appears rather odd, to put it mildly.<sup>27</sup> The most obvious question is the following: How are we to think of the *unity* of Plotinus' account? The question becomes more pressing if we take into account that our aim is to see how a myth may help us to "grasp together" the elements of the composite structure of the world. In general terms (which exceed the Aristotelian precepts for the unity of a plot), a narrative can be unified ultimately either on the basis of the characters that appear and act in them or on the basis of some framework established by the events that are being recounted. We may thus begin by considering these two options.

While the soul indeed assumes the leading role in Plotinus' narrative, the portrayal of its nature and activity is both complex and vague. As we have seen, the soul is personified as a maker in the second image, but Plotinus passes over the opportunity to present its character, capacities and actions; its creative nature is merely asserted by concentrating on its creation. Given its other appearances, as a source of light and its light and as a sea, the soul cannot be 'reconstructed' as a character in any ordinary way: we cannot attribute to it intentions directly and we cannot infer the existence of intentions from the data of its activity.<sup>28</sup> We are guided to understand the creative activity of the soul not as the externalisation of a subjective structure, but as the manifestation or appearance of a rational, but 'unconscious,' acting force; hence, the unity we are seeking cannot be expressed in subjective terms.

What can we say about the events narrated in the story? A first point is that, although, as we have seen, within the images themselves spatio-temporal relations are established in quite complex ways, there is no overall spatio-temporal framework which could provide some external sort of unity. If we examine now the natural phenomena or artificial activities which constitute the content of these images, we realise that there is nothing internal to them

that would suggest any kind of normal continuity: a light is struck and, out of the darkness, a house emerges to become a net immersed in the sea. How are we to think the unity of this 'event,' which seems to transcend all the classical unities?

At this point it would perhaps be helpful to approach the issue the other way round: What are the requirements of a myth that could present effectively the "being together" of the elements of a composite structure? This myth would have initially to separate these elements and their activity and use an appropriate spatio-temporal framework in order to present their relative order of priority within the composite structure. However, if the final aim is the "συναιπεῖν" of these elements in their unity, we would expect a 'deconstructive' use of these devices: the spatio-temporal markers would unite as much as separate, and the activity of the elements would be described in such terms as to make these elements 'efface' themselves in the final product, i.e. lose their separate and distinct nature in the emergent dynamic unity of the composite, which would be thus presented as containing its own source of movement or development.

In the case of a generated, composite thing, such as the sensible world, the elements to be separated in this context are ultimately form and matter. As Plotinus puts it, echoing the discussion of chora in the *Timaeus* (50-1), the nature of such things can be thought of as a synthesis of an inert material and an active form which shapes it:

for in some things, because of their bodily nature, individuality is fluid because the form comes in from outside and they have continual existence only according to specific form (τῶν σωμάτων τῇ φύσει τοῦ καθέκαστον ρέοντος ἅτε ἐπακτοῦ τοῦ εἶδους ὄντος τὸ εἶναι κατ' εἶδος αἰεὶ ὑπάρχει), in imitation of the real beings; but in others, since they are not produced by composition (οὐκ ἐκ συνθέσεως οὐσι)...(IV.3.8.25-28).

The separation of the intelligible from the material has two senses, one absolute and one relative. From an ontological point of view, form and matter remain always separate and do not suffer any real change in their interaction. As Plotinus puts it, "νοῦς μόνος, ἀπαθὴς ἐν τοῖς νοητοῖς ζῶν μόνον νοεράν ἔχων ἐκεῖ αἰεὶ μένει" (IV.7.13.2-3), while matter "μένει οὐδ' ἐξ ἀρχῆς ἦν" (III.6.11.18); even soul, the agent of their interaction, "ἄνως μένει" (34). This absolute separation, however, does not belong to the perspective of a discourse dedicated to an account of the emergence of the composite, which would be

impossible without some kind of interaction; such a discourse should separate these elements in a relative way, i.e., with reference to their order in the composite structure.

In order to present this relative separation, Plotinus follows both models elaborated in the *Timaeus*. The second image belongs to the 'deliberate creation' model, which sets the framework of the *Timaeus*; the two other follow the 'instant interaction' model, which Plato developed in his discussion of the receptacle (49A-52D). In each case, in accordance with Plotinus' concrete narrative goals, the primacy of the active element is clearly presented or implied: the source of light which informs darkness, the architect who stands above the house built, the sea which imparts motion, and thus life, to the net. However, the specifically Plotinian contribution to the elaboration of these images within the models followed, lies precisely in an attempt to efface as much as possible the relative separation which underlies the hierarchy established. This tendency operates, as we have already seen, both in a passive and an active way. Passively, it guides, for example, the omission of all the details concerning the creative activity of the architect: when Plotinus had the narrative opportunity to present the operations of the maker on the material, he sent off-stage the maker (safeguarding his transcendent status), made no mention whatsoever of the material, and concentrated his attention on the house made. Actively, this tendency is expressed in the choice and elaboration of the two other images: the spatio-temporal frameworks and the natural phenomena described in both images tend to merge or collapse the separate elements into a single entity: the light-with-its-dark-boundary, the net-within-the-sea.

Similar remarks can be made if we examine Plotinus' literary device in shaping the entire account. The story appears as a collection of pictures that present the same tableau from different points of view; its oddness is a result of the fact that, so to speak, Plotinus turns off the light (breaks all narrative continuities) as he moves his camera from place to place in order to capture the different views. The overall effect of the narrative resembles the effect of a metamorphosis story: something becomes, in ways that cannot be explained in an ordinary way and point implicitly to some internal ability of self-transformation, something else. Instead of a narrative sequence of the form 'A and B interacted in such a way as to produce C' or 'A did B and as an effect there came to be C,' Plotinus' account appears to have the shape of 'A became B became C,' without differentiation between separate entities and reference to external determinations.

The major philosophical issue implicated by Plotinus' narrative strategy concerns the nature and the role of the cosmic soul. So far, not without justification (see n.5), we have treated the cosmic soul as equivalent to the Platonic Demiurge. A full discussion of the issue would have to include three dimensions: (a) the relation between the Demiurge and soul in the *Timaeus* (in the context of other late Plato's works, such as the *Laws*); (b) Plotinus' interpretation of Plato's position; and (c) Plotinus' own views on the issue. Here we cannot of course undertake this examination; we shall limit ourselves to a few remarks related to the cosmogonical context.

With regard to Plato, we should note that (a) the interpretation of the figure of the Demiurge (its status, its relation to the ideas (in particular the idea of good), or the soul) is still an open issue<sup>29</sup> and (b) the (cosmic) soul, on the one hand, is described as generated and, on the other, is characterised as the source of motion (and hence of any creative activity of generation).<sup>30</sup> Plotinus understands Plato's position in terms of a threefold distinction, associated with the three principal hypostases, in which the One is identified with the Good and is called "the father of the cause," the Intellect is identified with the Demiurge and is called the "cause," and the Soul is described as being made by the Intellect (V.1.8.1-8; cf. IV.8.1.40-51).<sup>31</sup> Hence, it would seem that Plotinus himself considers the cosmic soul as generated by the Intellect, which is thus the real Demiurge behind the creation of the soul and the world (ποίητην ὄντως καὶ δημιουργόν; V.9.3.26). In this case, we have to face two related questions: What precisely is the creative function of the cosmic soul in relation to the Intellect? Why does Plotinus not start his cosmogony from the creation of soul itself?

With regard to the first question, Plotinus seems, not surprisingly, to think in terms of a hierarchical continuum of creative principles, within which the (cosmic) soul plays an executive or ancillary function. Depending on the specific contexts, the description of this hierarchy is fluid enough to allow for formulations that, at least, seem to place the emphasis differently: sometimes the creative function of the soul is minimised, sometimes the creative principle is divided between the Intellect and the cosmic soul, sometimes the cosmic soul is designated as the properly creative or executive principle.<sup>32</sup> In any case, two points seem clear. First, the cosmic soul derives the principles which guide its creative activity from the Intellect: as Plotinus puts it, the ordering activity of the soul "depends on an abiding intellect of which the image is the order in soul" (IV.4.10.12-3).<sup>33</sup> Second, the auxiliary function of the cosmic soul can not be actually conceived in terms of a standard distinction between

conception, planning, and execution. As we have already noted (see n.17), Plotinus thinks of the activity or effectiveness of form in its interaction with matter not in terms of planning and execution, but in terms of an instant and sudden attraction between two elements, one active and one passive, in the close proximity (γειτονεῖα) generated by the soul's "going forth." In this context, apart from the potency of the active element, Plotinus is eager to point out the passive suitability of the inert element (i.e., "ἐπείπερ ὑπέσθη" in the first image); he will even attribute to it, although negatively, an active tendency (generated through reflection) to embrace form and thus become form in an active sense (i.e., "αὐτοῦ ποιεῖσθαι ἐν ᾧ ἔστιν" in the third image). In this sense, the function of the soul would be to create a space, or rather a spacious proximity between the intelligible and the material, in which embodied forms can, so to speak, emerge spontaneously. In Plotinian terms, the soul is an "interpretative medium" which links the sensible with the intelligible domain<sup>34</sup>. From this point of view, we might say that the soul is both indispensable (no soul, no proximity, no sensible world) and superfluous (what indeed does soul add to the composite?): as long as the proximity is established, the interpreter 'disappears' (although it is everywhere), having brought into being (or being the order of) a unified composite of form and matter.<sup>35</sup>

Returning now to the issue of the form of Plotinus' account, we may draw a few concluding remarks. The task is an account which, respecting both the absolute and the relative separation of the elements of the composite structure, would try at the same time to establish the internal or immanent intelligibility of the sensible world. Plotinus' philosophical answer to this demand, which we have outlined in our discussion without examining it in detail, is the elaboration of a conception of the nature and mode of activity of the (cosmic) soul (in the context of a general account of the effectiveness of form or the activity of the Intellect) which transcends the standard distinction between deliberate (rational) action and 'blind' (mechanical) activity (as this can be found in the *Timaeus*). This conception informs his brief cosmogony, which assumes thus the form of a metamorphosis story, in which, to the extent that this is possible, creation or interaction is replaced by self-transformation. The genesis (and hence the order) of the sensible world is presented in terms of a single creative force, the cosmic soul, which, with all the relevant qualifications, acts upon itself; with the help of this entity, the interaction between two separate elements (matter and form) appears as ■ self-transformation which contains within itself the principle of its development. From this point of view, the fact that Plotinus does not start his cosmogony with a psychogony can be

explained as a sign of his reluctance, in this context, to bring into account anything that would point outside this process of self-transformation.

Announcing the contents of his cosmogony, Plotinus talks about that "which happened, when the soul which was altogether pure from body took upon itself a bodily nature" (τὸ γινόμενον πάθος τότε, ὅτε ψυχὴ καθαρὰ οὔσα σώματος πάντα ἰσχει περὶ αὐτὴν σώματος φύσιν) (13).<sup>36</sup> The creation story has already been programmatically transformed into a metamorphosis story, the story of the soul which became the world, but the question is already facing us: Why did the soul transform itself?<sup>37</sup>

## Notes

1. The text of Plotinus used is that of Henry and Schwyzer OCT *editio minor*, *Plotini Opera* (Oxford; 1964-82). Translations follow A. H. Armstrong's Loeb edition, *Plotinus with an English Translation* (Cambridge, Massachusetts; 1966-88), but are frequently modified by me. Passages from IV.3 are cited in the text by chapter and line numbers only; passages from IV.3.9 are cited by line numbers only.
2. Plotinus faces the issue in I.8 and in II.4. For a discussion with further references, see D. O'Brien, "Plotinus on Matter and Evil" in L. P. Gerson, ed., *The Cambridge Companion to Plotinus* (Cambridge; 1996), 171-195.
3. Cf. here Plotinus' program for a reading of the *Timaeus* in the context of an enquiry about soul outlined in IV.8.2; the questions concern (1) πῶς ποτε κοινωνεῖν σώματα πέφυκε [ἡ ψυχὴ]; (2) περὶ κόσμου φύσεως; (3) περὶ ποιητοῦ.
4. Inserted by Theiler; accepted by Henry-Schwyzler and Armstrong.
5. Plotinus mentions the special creative role of the cosmic soul in a number of passages; see, in particular, IV.3.6 (the metaphors quoted come from II.14-5) and V.1.2. We will return to the issue of the relation between the cosmic soul and the Demiurge at the end of our discussion.
6. Contrast here the *Timaeus*. Plato claims both that the soul "is prior in birth and excellence" (34C) with regard to the body of the world and that one of the ingredients in its construction is the "being which is transient and divisible in bodies" (Περὶ τὰ σώματα μεριστὴ οὐσία) (35A). If we respect the narrative order (whether or not we want to interpret the *Timaeus* literally), this "being" can not be the sensible world, but is the chaotic "becoming" (γένεσις), which exists before the creation of the world (52D). In Plotinus' terms, that would be "not ordered matter."
7. That Plotinus thinks in terms of ordering, but not of an act of ordering is made clear in IV.4.10.9-11: "for the things it [the universe] ought to have already been discovered and ordered without being set in order; for the things set in order were the things that happened, and what made them was the order (ἤδη γὰρ ἐξεύρηται καὶ τέτακται ἃ δεῖ, οὐ ταχθέντα: τὰ γὰρ ταχθέντα ἦν τὰ γινόμενα, τὸ δὲ ποιοῦν αὐτὰ ἡ τάξις)."
8. For an orientation in this issue, see the exchange between G. Vlastos ("The Disorderly Motion in the *Timaeus*" in R. E. Allen, ed., *Studies in Plato's Metaphysics* (London; 1965), 379-99), H. Cherniss (*Aristotle's Criticism of Plato and the Academy* (Baltimore; 1944), 421-431), G. Vlastos ("Creation in the *Timaeus*: Is It a Fiction?" in R. E. Allen, ed., *Studies in Plato's Metaphysics* (London; 1965), 401-419), and L. Tarán ("The Creation Myth in Plato's *Timaeus*" in J. P. Anton and G. L. Kustas, ed., *Essays in Ancient Greek Philosophy* (Albany; 1971), 372-407).
9. "τὸ σύνθετον φασιν ἐν τούτοις κεκληῖσθαι γενητόν, τούτῳ δὲ συνυπάρχειν καὶ τὸ ἀφ' ἑτέρας αἰτίας ἀπογεννᾶσθαι" (In *Platonis Timaeum*, 85A; the reference is to *Timaeus*, 28B). The phrase "σαφηνείας ἕνεκα διδασκαλικῆς" comes from 89A. For reports of the ancient opinions, see A. E. Taylor's *A Commentary on Plato's Timaeus* (Oxford; 1928), 66-70 (ad 28B.4); J. M. Dillon, *Iamblichus Chalcidensis In Platonis dialogos commentariorum fragmenta* (Leiden; 1973), 303-7; and H. Cherniss, ed., *Plutarch's Moralia*, XIII.1 (Cambridge, Massachusetts; 1976), 168-71 (ad *De anima procreatione in Timaeo*, 1013A-B). For a discussion of this material, see R. Sorabji, *Time, Creation and the Continuum* (London; 1983), 268-283.
10. Thus it would be misleading to consider Plato's or Plotinus' use of 'myth' in this context as a regression to myth in its traditional sense: it is rather an attempt to specify the correct form of an account of the constitution of certain objects (e.g., the sensible world as σύνθετον), in close connection to a rigorous philosophical specification of the nature of these objects.
11. Cf. here: "To ask why Soul made the universe is like asking why there is soul and why the Maker makes (τὸ δὲ διὰ τί ἐποίησε κόσμον ταῦτόν τῳ διὰ τί ἔστι ψυχὴ καὶ διὰ τί ἐδημιουργὸς ἐποίησεν). First, it is a question of people who assume a beginning of that which always is: then they think that the cause of the making was a being who turned from one thing to another and changed" (II.9.8.1-5).
12. Cf. here: "ἡ πᾶσα ψυχὴ οὐδαμοῦ ἐγένετο οὐδὲ ἦλθεν· οὐδὲ γὰρ ὅπου· ἀλλὰ τὸ σῶμα γειτονήσαν μετέλαβεν αὐτῆς" (III.9.3.1-3).
13. Plotinus usually makes the point in terms of a distinction between powers or parts of the soul, as in the next chapter: "but one power belongs to soul which remains within it, and another which goes out to something else" (IV.3.10.33-4); cf. also, II.3.9.31-4; V.1.3.7-11 (in the general context of II.6.3.14-20 and V.4.2.27-34); and in particular II.3.18.8-14, where we encounter again the image of 'strengthening' and 'overflowing': "δεῖ τὴν τοῦ παντός ψυχὴν θεωρεῖν μὲν τὰ ἄριστα αἰεὶ ἰεμένην πρὸς τὴν νοητὴν φύσιν καὶ τὸν θεόν, πληρουμένης δὲ αὐτῆς καὶ πεπληρωμένης οἷον ἀπομεστούμενης αὐτῆς τὸ ἐξ αὐτῆς ἰσχυρὰ καὶ τὸ ἔσχατον αὐτῆς πρὸς τὰ κάτω τὸ ποιοῦν τοῦτο εἶναι."
14. Given this image one would expect that the darkness circumscribes light, i.e., the familiar picture of a point-like source of light radiating in all directions. We shall see in the discussion of the third image that this is not the case.
15. Cf. here: "The only possibility that remains, then, is that all things exist in something else, and, since there is nothing between, because of their closeness (γειτονεία) to something else in the realm of real being something like an imprint and image of that other suddenly (ἐξαίφνης) appears, either by its direct action or through the assistance of soul" (V.8.7.12-16). A. H. Armstrong notes *ad loc.*: "The insistence on the immediate and intimate relationship of the intel-

- ligible and the sensible universes and the comparative unimportance of the mediation of the soul should be noted." We should note that a proper appreciation of the mediative role of the soul should take into account the fact that this "closeness" exists only in the light generated by the 'strengthening' of the soul; without soul there would be no "closeness." We will return to this issue at the end of our discussion.
16. Cf.: "καὶ ὁ κόσμος δὲ γένοιτο ἂν ἄνευ μεταλλοιώσεως. οἷον οἷς περιτίθεμεν" (III.6.11.20-1); "ἀλλ' οὖν εἶδαι κατέσχηται ἐξ ἀρχῆς εἰς τέλος, [the universe], ... ὅθεν καὶ χαλεπὸν εὐρεῖν τὴν ὕλην ὑπὸ πολλοῖς εἶδαι κρυφθεῖσαν" (V.8.7.19-23).
  17. Plotinus will make his position on the spontaneous nature of the creative activity of the soul clear in the next chapter: "For whatever comes into contact (ἐφάπνηται) with soul is made as the essential nature of soul is in a state to make it; and it makes, not according to a purpose brought in from outside, nor waiting upon planning and consideration (ἡ δὲ ποιῇ οὐκ ἐπακτῶ γνώμῃ οὐδὲ βουλήν ἢ σκέψιν ἀναμείνισσα)" (IV.3.10.13-16). The claim should be obviously read in the context of Plotinus' notion of intelligible creativity (e.g., V.8.7).
  18. The clause reads: "ὥς ἂν ἐν ὕδασι δίκτυον τεγγόμενον ζῶῃ." "ζῶῃ" is characterised "uix recte" by Henry-Schwyzler and is deleted (as "seltsam") by Theiler. Henry-Schwyzler conjecture without conviction "ἐρωῇ:" "as if a net immersed in the waters moved forth." In any case, the sentence makes sense under the assumption that the image refers to the passive movement of a net thrown in the sea, in a context where the existence of motion gives the appearance of life.
  19. The situation is similar in the *Timaeus*. The soul is "set" (θεῖς) in the center of the body, but is extended in such a way as to envelop the entire exterior of the body (34B; 36D); the qualification neutralises the most obvious inference of the metaphor, namely that the soul is 'in' body; the soul is simultaneously 'in,' 'through,' and 'out' of body. Cf. Plotinus' comments in III.9.3.3-4 and V.1.10.21-4.
  20. This image should be compared with a similar image from an earlier treatise, V.1.2.14-28 (10). There, "before soul it was a dead body .... or rather the darkness of matter and non-existence (πρὸ ψυχῆς σῶμα νεκρὸν, ... μᾶλλον δὲ σκότος ὕλης καὶ μὴ ὄν)" and we should imagine "soul as flowing in from outside, pouring in and entering it everywhere and illuminating (εισρέουσιν, εἰσχυθεῖσαν, εἰσιούσαν, εἰσλάμπουσιν): as the rays of the sun light up a dark cloud (σκοτεινὸν νέφος), and make it shine and give it a golden look (λάμπειν ποιοῦσι χρυσοεἰδῇ ὅψιν διδοῦσαι) ...." From our point of view, the strength of this image, which understandably appealed to Sts. Basil and Augustine (see Armstrong's note *ad loc*), is its weakness: it derives from a number of stark antitheses (inside-outside, before-after, light-darkness) that, in our reading, Plotinus himself tries here to undermine.
  21. The word "σκιά" appears for the first time in IV.3.9.48-9: "καὶ τοσαύτη ἐστὶν ἡ σκιά, ὅσος ὁ λόγος ὁ παρ' αὐτῆς [τῆς θαλάσσης ... τῆς ψυχῆς]."
  22. *Timaeus*, 29B-D. The success of Plato in this respect does not concern us here.
  23. The issue has been discussed by P. Hadot, in "Physique et poésie dans le *Timée* de Platon," *Revue de Théologie et de Philosophie* 115 (1983); cf. B. Κάλφας, ed., *Τίμαιος* (Athens 1995), 55-57. The relevant Aristotelian material comes mostly from Book VI of the *Poetics*. On the issue of mimesis in the *Timaeus*, see also, S. Halliwell, *Aristotle's Poetics* (London 1986), 117-19.
  24. The headings are taken from F. M. Cornford's division of the *Timaeus* in *Plato's Cosmology: The Timaeus of Plato* (London; 1966).
  25. Thus, for example, Plato is able to claim that the 'mixture' of reason and necessity which characterises the world should be described in terms of "necessity yielding to intelligent persuasion" (48A).
  26. *Poetics*, 1450a 22-39.
  27. We should merely note here, since we do not have the space to pursue it, that an analysis of Plotinus' story in terms of other Aristotelian concepts (such as περιπέτεια and ἀναγνώρισις) may lead to very interesting results.
  28. Obviously some inferences can be drawn. We may, for example, attribute to the soul an intention to care for the house it builds. But recall Plotinus' exact formulation: "ἄξιος ἐπιμελείας νομισθεὶς [ὁ οἶκος]" (IV.3.9.31-2); even here Plotinus avoids active attribution to an agent.
  29. For a discussion of the issue, see H. Cherniss, *Aristotle's Criticism of Plato and the Academy*, Appendix XI, 603-610.
  30. Soul as generated: *Timaeus*, 34A-36E and *Laws*, 892C, 904A, 967D; soul as the source of motion: *Laws*, 896A-897B. For a discussion of the ensuing problems, see G. Vlastos, "The Disorderly Motion in the *Timaeus*," 390-9 and "Creation in the *Timaeus*: Is It a Fiction?," 414-9.
  31. There is a passage where Plotinus seems to identify the Demiurge of the *Timaeus* with the cosmic soul, on the basis of the fact that the Demiurge "planned" (διενοήθει) and this is a function of the soul and not of the Intellect (III.9.1.35). As Armstrong notes *ad loc*, Porphyry identified the Demiurge with the cosmic soul and believed that this was Plotinus' view (Proclus, *In Platonis Timaeum*, 94A; Proclus disagrees with the attribution to Plotinus). Two things should be noted here: (1) As we have seen, Plotinus would not accept that the cosmic soul creates by "planning" (see n.17); (2) Plotinus criticises a similar position as a gnostic misinterpretation of Plato in II.9.619-25.
  32. (1): "something like an imprint and image of [something in the realm of real being] suddenly appears [in the sensible world], either by [real being's] direct action or through the assistance (διακονησαμένης) of soul" (V.8.7.13-6); (2) "but since the ordering principle (κοσμοῦν) is twofold, we speak of one form of it as the Craftsman (δημιουργόν) and the other as the Soul of All (τοῦ παντός

ψυχῆν)" (IV.4.10.1-3); (3) see n.5. The problem is more complicated, because Plotinus extends this hierarchy at the lower side in order to include both an immanent soul of nature (to be distinguished from the cosmic soul) and/or individual souls (cf. II.1.5; II.3.17-8; II.9.6.60-3; IV.4.10; and n.13).

33. Cf. II.3.17.13-18; II.3.18.8-14; II.9.4.9-10; V.9.3.24-37.

34. "This soul gives the edges (περάτα) of itself that border on the sun to it [the sun], and creates by means of itself a connection to the sun there [the Nous], by becoming, so to speak, interpretative (καὶ ποιεῖ διὰ μέσου αὐτῆς κάκει συνῆφθαι οἶον ἐρμηνευτική) of what comes from that sun to this sun, and from this sun to that sun, as far as this sun can reach the other through soul" (IV.3.11.17-21).

35. Thus, given the mediating and unifying function of the soul, Plotinus can describe the sensible world without reference to the soul: "Then matter, too, is a sort of ultimate form; so this universe is all form, and all the things in it are forms; ... the making is done without fuss, since that which makes is all real being and form (ἐπεὶ δὲ καὶ αὕτη εἶδος τι ἔσχατον, πᾶν εἶδος τόδε καὶ πάντα εἶδη ... ἐποιεῖτο δὲ ἀσποφῆτι, ὅτι πᾶν τὸ ποιῆσαν καὶ οὐσία καὶ εἶδος)" (V.8.7.23-25).

36. Note here the reversal of the theme of 'covering' (see n. 16).

37. I would like to thank Professors S. R. L. Clark, J. M. Dillon and S. Stern-Gillet for their comments on earlier versions of this paper. I am grateful to the Greek Foundation for State Scholarships (IKY) for currently funding my research project and the British Academy for a studentship I was awarded during 1997-1998.

## Divinized and De-divinized Conceptions of the World and of *Cosmos*

Leonidas C. Bargeliotes

Plato and Aristotle and, consequently, Neoplatonism and Aristotelianism, differ among themselves on account of their divinized and de-divinized conceptions of the world and of *cosmos*. Generally speaking, the former conception originates with the Italians, the latter with the Ionians. This, however, does not exclude a supplementary and interactive relation between them. The recognition of this distinction and the attempted interaction are important not only for the understanding of the Presocratic philosophy, but also for the particular tendencies and differences between the two great philosophers and their adherents. This is manifest in considering Plato's and Aristotle's ways of approaching the world, as well as in the criticism that Neoplatonists have raised against Aristotle's own half de-divinized world and aesthetic approach. Examples are drawn from the long complex of divinizing tradition which includes, among others, Pythagoreans and Platonists, Neoplatonists and Neopythagoreans. They mostly follow the divine masters: Pythagoras and Plato, and understand the world as divine and harmonious. They also contrast their own religious like doctrines with those of the Ionians and of Aristotle and find them inferior and de divinizing the world; the latter, according to their arguments, search for "material" causes, among other things, in order to give "physical" explanations and empirical arrangements to the world phenomena. In a word, they move from a divine mythical background and of *cosmos* to a "physical" or "natural" conception of the world.

Plato's aesthetic synthesis, as we shall see, is rooted in the conceptions of the world as *cosmos* of his predecessors, which he reshapes, transforms and enriches. "They express in words," as G. Mueller has put it: "as sculptors do

in stone, the vision of a beloved world." As a matter of fact, Eros, the love of the artist, is known to be the oldest divine artist, transforming chaos into *cosmos*. The blessed and happy *cosmos* is, therefore, the outcome of love for a balanced and harmonious achievement, but this "telos of love," stands in contrast to the unbalanced and disharmonious human existence. There is no doubt that behind the Platonic — and the Neoplatonic — conceptions of *cosmos* is, undoubtedly, Heraclitus' invisible harmony, "The invisible harmony is better than the visible."<sup>2</sup> But this invisible harmony is hard to find; it can only be found by the soul animated by an anticipating urge in the right direction.<sup>3</sup> Man will find the truth of the human affairs when he opens his psyche to the truth of God, which means a conversion, the turning-around from the untruth of human affairs to the truth of the Idea.<sup>4</sup> This, in turn, can be achieved by proper education and the replacement of the unseemly symbolizations of gods, as they were to be found in the poets, by the seemly symbols.<sup>5</sup> As E. Voegelin<sup>6</sup> has stated, "the validity of the standards developed by Plato and — partly — by Aristotle depends on the conception of man who can be the measure of a society because God is the measure of his soul." To this argument it is added the Platonic Eros — and its variants — toward the *kalon* and *agathon*, as well as their mathematical achievement and subordination of the forces in the soul. From our point of view, this interpretation is partly true regarding the conceptions of the world and of *cosmos* by both Plato and Aristotle and their adherents, because their reaction was different. Plato relies heavily on the divinized Pythagorean concepts of *Philosophia*, of *cosmos*, of *number* and of *harmonia*, which he reshapes, transforms and enriches in accordance with his Ideal World. Aristotle, based upon his own *entelechiac* and teleological conceptions of man and the world, rejects Pythagoreanism and partly de-divinizes the world. In what follows, the great Platonic and Neoplatonic conceptions of *cosmos* and of their aesthetic syntheses are extensively quoted and analysed to this effect.

In the first place, for the Pythagoreans philosophers are not only those who must inquiry into "a great number of things"<sup>7</sup> or those who are travelling *θεωρίας ἐνεκεν*,<sup>8</sup> but also those who are *φιλοὶ σοφία*, in a deeper meaning of the word — such as "purification" and salvation through philosophy — those who consider man as an immortal god.<sup>9</sup> As Aristoxenus said of Pythagoras and of his followers,<sup>10</sup> "every distinction they lay down as to what should be done or not done aims at conformity with the divine. This is their starting point; their whole life is ordered with a view to following God, and it is the governing principle of their philosophy." This is the effort to escape through assimilation to God, ("φυγὴ δὲ ὁμοίωσις θεῷ κατὰ τὸ δυνατόν"),<sup>11</sup> in

contradistinction with those who "think mortal thoughts," ("θνατὰ χρεὶ τὸν θνατόν, οὐκ ἀθάνατα τὸν θνατόν φρονεῖν").<sup>12</sup> Assimilation to God was for Pythagoras the goal of life, an aspiration rooted in the limit and order, of *πέρας* and of *κόσμος*. Plato's main concern, as we shall see, is the exploration of the human soul, and the true order of the soul turns out to be dependent on philosophy in the strict sense of the love of the divine *σοφόν*.<sup>13</sup>

For the Pythagoreans, *cosmos* unites the notion of order, arrangement and structural perfection with their beauty, things are interconnected and all nature is akin, and the human soul is intimately related to the living and divine universe. Pythagoras was the first to apply the name of *cosmos* to the world, in recognition of the order it displayed.<sup>14</sup> According to this religious doctrine, it is the "priests and priestesses concern to give a reasoned account"<sup>15</sup> of the nature of things, that is, all nature is akin, as the "wise men tell us that heaven and earth, gods and men are bound together by kinship and love and orderliness and temperance and justice."<sup>16</sup> The philosopher through association with what is divine and orderly (*κόσμιος*) becomes divine and orderly (*κόσμιος*).<sup>16</sup> The revolutions of our own thought, which is akin to the circuits of intelligence in the heaven, may profit by them by learning to know them and acquiring the power to compute them rightly according to nature; we might reproduce the perfectly unerring revolutions of the god and reduce to settled order the wandering motions in ourselves."<sup>17</sup> These men are the "best spectators," ("βέλτιστοι θεαταί"),<sup>18</sup> who take part in festival or fair. In short, the philosopher who contemplates the *cosmos* becomes *kosmios* in his own soul. *Cosmos*, for the Pythagoreans is the key to the whole.

Pythagoreans are also known for the important advances in the science of mathematics and its relation with *harmonia*. For the Pythagoreans number had a mystical significance and independent reality. As W. K. C. Guthrie<sup>19</sup> puts it, "Number was responsible for 'harmony,' the divine principle that governed the structure of the whole world." Numbers not only explained the physical world, but also symbolized or stood for moral qualities and other abstractions. They could express the love for the agreement of all things, and become the reconciling principle of the limiting form and the unlimited stuff, of the all-embracing Eleatic Being and the Herakleitean flux, better, the reconciling "force" of the things of sense-perception and the ordered soul, of the divine nature and the human art, especially music.

No one else save Plato and the Neoplatonists come so close to the Pythagorean religious character of mathematics. For Plato, in contrast with Aristotle, the acquisition of mathematical knowledge partakes more of the

character of religious initiation than of mere instruction or research. For Plato, Arithmetic "draws the souls upwards...never allowing anyone to offer it for discussing mere collections of visible or tangible bodies."<sup>20</sup> Similarly, the objects of geometrical knowledge are "eternal, not subject to decay," and it tends to draw the soul towards truth and to produce a philosophic intelligence for the directing upwards of faculties which we wrongly turn earthwards."<sup>21</sup> Astronomy, too, as a pure mathematical science, must turn the soul's gaze upwards, not literally to the sky, but to the realm of "real being and the invisible."<sup>22</sup> This divinizing orientation of mathematics versus the de-divinizing observations of the empirical scientists who are discussing mere collections of visible or tangible bodies and are directing the faculties to turn earthwards and to the natural revolutions of heaven. The latter were seeking accounts and reasons to explain the phenomena, rather than forcing the phenomena and trying to fit them into arguments and opinions of their own. As Aristotle complained, they insisted on making the system coherent and they invented a non-existent planet to make up the total to the sacred number ten. Hence Aristotle's general rejection of their doctrine, that "things themselves are numbers," or that they "imitate" or "represent" numbers, or again, that they supposed the elements of numbers to be the elements of things and the whole heaven to be a harmony and a number."<sup>23</sup> Aristotle seems to express the spirit of Ionian thought, which, in the words of Guthrie,<sup>24</sup> was "less bemused by the religious associations of number and more rational in approach." Numbers are intimately connected with *harmonia*.

The word *harmonia* meant primarily the joining or fitting things together which the Pythagoreans equated with number and associated with music. The generalization of the number could apply to the whole heaven and become the harmony of the spheres,<sup>25</sup> while the numerical ratios could determine the concordant intervals of the scale."<sup>26</sup> Like *cosmos* which represented order and beauty the basic intervals of music could be represented by the ratios 1:2, 3:2 and 4:3, and be imposed on the chaotic range of sound by means of the four integers 1, 2, 3, and 4. These add up to 10, upon which the Pythagoreans have based their belief that this number "was something perfect, and contained in itself the whole nature of number."<sup>27</sup> It is this number that the Pythagoreans represented graphically by the figure known as tetraktys, a sacred symbol for them, to which the followers of Pythagoras, were said to swear by him who handed down to them the tetraktys, "source and root of everlasting nature."<sup>28</sup> All these divinized Pythagorean conceptions, can be seen in Plato's great aesthetic synthesis.

Aesthetics for Plato are the arts and the ways of life inspired by the divine Muses, which constitute his divine—mythical background. In his own words, "the human soul, inspired by the Muse with 'divine madness' (*μανία*), creates 'music' (*μουσική*), the highest blessings of human existence—without which life would not be worth living."<sup>29</sup> This sort of madness is a gift of the gods, fraught with the highest bliss (*ἐπ' εὐτυχία τῇ μεγίστῃ παρὰ θεῶν ἢ τοιαύτῃ μανία δίδοται*). Both, aesthetic unity of soul and man, and symbolic fusion of body and soul, constitute the foundation of the true community and "of our national culture." It celebrates itself in the great national festivals and becomes aware of itself in the artistic glorification of its historical past. Hence, "the true Muse is the companion of reason and philosophy,"<sup>30</sup> for the aim of the philosopher is to discern the nature of soul, divine and human, its experiences, and its activities. Eros as aesthetic love, in response to the call of the Muse, transfigures the given stuff into an expressive image of life,<sup>31</sup> motivates the true artist and distinguishes him from the *ἄμουσον*. This means that we have the technicians without inspiration, and those whose inspiration is impure and immoral; only the philosopher poet can unify these two conditions.<sup>32</sup> Love, then, is himself so divine a poet that he can kindle in the souls of others the poetic fire...we are everyone of us a poet when we are in love."<sup>33</sup>

The final end and consummation of the aesthetic life is, for Plato, a blessed union with the appearance of Beauty,<sup>34</sup> which means the production of dialectical contrasts between real and apparent beauty, between the outside and the inside illusion and, consequently, between Plato's condemnation of art from the practical point of view, and the unsurpassable heights of his art in which beauty is praised as the highest good. It also means the inadequacy and helplessness of a purely aesthetic culture, and that contemplation of beauty transcends the beauties of the earth, of the bodies, of practices and of sciences until one arrives at the knowledge of beauty itself and the essence of beauty, the "divine beauty," the "pure and clear and unalloyed...the divine beauty in its uniqueness."<sup>35</sup> Thus, every work of art is a concrete whole of opposites, made visible to imagination and philosophical self-comprehension, while "beauty in and for herself," which man enjoys, is the "only home he has in this world." For when man has brought forth and reared this perfect beauty, he shall be called the friend of god, and if ever it is given to man to put in immortality, it shall be given to him."<sup>36</sup> Man's soul is open to the transcendent Ideal Whole and is opposed to the charms of beautiful appearance. There is a need for it to go beyond beauty and art in order to evaluate beauty and aesthetic life with reference to the whole of reality. The ideal whole of reality without any

visible embodiment, is "beyond (any given) being in power and dignity."<sup>37</sup> God too has been conceived as a self-sufficient organism whose life depends on nothing outside of itself. The divine whole has no sense-object against itself. As a matter of fact, this marks the culmination of Plato's thought and the beginning of Neoplatonism. In the end is the beginning. Plotinus, Proclus and Plethon will be respectively treated to this effect, in spite of their transformation they brought about in regard to their conception of *cosmos* and of divinity, and in opposition to the Aristotelian de-divinized strategy.

Plotinus, to begin with, in his conception of divine—physical beauty and the beauty of arts follows, in the main, Plato, but with variations. He preserves the divinization strategy in his hierarchical structure of reality and objects Aristotle's categories as completely inadequate, inapplicable and irrelevant for the *κόσμος νοητός*, but useful for the *κόσμος αἰσθητός*.<sup>38</sup> The dialectician, however, has the right to judge and use or ignore as his superior wisdom dictates.

Thus, the life of the organic unity which has its source beyond the world of forms, that is, in the Good, it is involved not only in the beauty which form gives to works of nature and art in the sensible world, but also in the beauty of forms themselves. It is by the *cosmos* of the world, its beauty and order that we are to know the divinity and be led to the contemplation of the intelligible. The work of art is beautiful in so far as it reflects the living organic unity of the whole which is the intelligible form. Plotinus, unlike Plato, puts the beauty of art on a level with the beauty of nature as a way to the intelligible beauty.<sup>39</sup> As the same author points out, Plotinus is only interested in the beauty of art, or of nature, as a help in our ascent to the intelligible beauty and beyond it to its source, the Good, which is older, not in time but in truth, and has the prior power—for it has all power.<sup>40</sup>

Plotinus, also, preserves Plato's view of the artist as copyist of sense objects, at two removes from the truth, although he considers the products of human art like those of the divine making, that is, images of forms in the intelligible world, to which the artist's mind, like all human minds, comes in direct conduct and which, in some cases, can improve on nature. He points out, that "Phidias did not make his Zeus from any model perceived by the senses; he understood what Zeus would look like if he wanted to make himself visible to us."<sup>41</sup>

Nature, too, though an image of wisdom (*ἰνδαλμα φρονήσεως*), is for him the appearance of the Over-Soul, which itself is derived from the archetypal Logos, and is divinized through its participation in the divine Beauty.

The divinity, says Plotinus, made the universe beautiful and harmonious throughout, which is its own aesthetic constitution.<sup>42</sup> He compares the movement of the heavenly bodies to a choral dance; they all aspire to the One. The moving and illuminating lights of the heavens are like the tones of a lyre. The natural harmony of the moving lights is like a musical symphony produced by instruments.<sup>43</sup> Even things that are less good or evil also contribute to the perfection of the universe. It follows that there is no necessity that all things be beautiful in the same degree because the very contraries (opposites) contribute to the perfection of the universe, and so the beauty of the world could not exist without them.<sup>44</sup> This, again, is illustrated by Plotinus' beloved instruments, the lyre and the shepherd's pipe. The assigned place of each string by the pitch of the sound and the weakest sound of the pipe can contribute to the total and perfect harmony. This leads us to recognize and appreciate that the world is a beautiful and brilliant spectacle—a magnificent and perfect image—that is beautifully formed by intelligible divinities.<sup>45</sup> The beautiful, then, even in that elementary stage, can only be known by the highest faculty which apprehends suprasensuous reality. This has led Plotinus to reject the classical concept of symmetry according to which there is a harmony of form and content, of soul and its embodiment, in the object. The conclusion is that symmetry is not beauty itself, but that it derives its beauty from a superior principle and, for that reason, cannot be scientific or derived from mutual agreement of these speculations. Plotinus goes beyond symmetry.

The Over-Soul, on the other hand, possesses the body of the universe. She contains all the souls in her breast, each distinct from her, but not separated. Entirely devoted to divine things and not withdrawn from her noblest contemplation, she governs the world by a single power whose exercise involves no anxiety.<sup>46</sup> Souls, therefore, are necessarily amphibians, since they alternately live in both worlds. The soul is the image of intelligence (*Nous*) and, as intelligence, is the image of the One. The closer we get to form, the greater the participation in divinity—and the assimilation to it. Analogous is the aesthetic ascent of the soul. When the soul is raised to intelligence, she sees her own beauty increased. Mathematics prepares for that achievement.

Mathematics, also, prepares the soul for the study of intelligibles and for purifying and strengthening it for the transition, to pure being.<sup>47</sup> When the soul is united to intelligence it is right in saying that "the soul's welfare and beauty lie in its assimilation to the divinity."<sup>48</sup> It is therefore only by intelligence that the soul is beautiful without any mediation and hence beautiful in itself.<sup>49</sup> This is the third stage of the Plotinian structure of reality. It is the stage of the third

kind of citizens, the philosophers, the divine men. "τὸ τρίτον γένος θεῶν ἀνθρώπων," as Plotinus calls them, who, in their mightier power, are able to reach the beauty in the intelligible world and have a clear vision of the splendor above. In an almost lyric style Plotinus refers to these divine men as taking their flight above the clouds and darkness of this world and then, looking beyond all here below, they remain there and reside in their true fatherland, delighting in the unspeakable place of reality and truth, like a man returning after a long wandering to the pleasant ways of his own native land.<sup>50</sup>

The opposition between the two worlds, the divine and the material, the divinized and the de-divinized, can, also, be seen in Proclus, particularly, in his hierarchical arrangement of souls in their descent in the world, in his conceptions of mathematics and of arts, in his evaluation of physics and in his anti-aristotelianism, in general. In the first place, at the top of his hierarchy Proclus places the souls of the gods that do not descend into the world, and are not affected by any change, but govern it from their transcendent status of independence. Below these come souls who do descend, but remain pure and unaffected by vice. And there are souls who do not only descend but also become corrupted by the material world.<sup>51</sup> Proclus uses Pythagorean and Orphic authorities to support Plato, while Aristotle, for him, occupies a subordinate place, in respect to his empirical approach,<sup>52</sup> to his image of the soul as tablet (γραμματοῦν),<sup>53</sup> as well as to his theory that numbers are mere abstractions from the material objects. The arguments which Proclus uses in a systematic way against this mundane derivation of mathematics are directed against the Aristotelian theory of abstraction in order to a further strengthening of the anti-Aristotelian position. From the Neoplatonic point of view the accuracy that mathematics possess cannot be derived from sensible objects. Neither immutable laws can be derived from a changing world, nor the general principles of demonstration can be posterior to sensible particulars. Almost all Neoplatonists are unable to understand the new possibilities that Aristotle's infinite indivisibility of mathematics opens for the solution, among other things, of the old problem of the Atomists and of Zeno's paradoxes.

Proclus's concerns, however, are different. He is mainly concerned with showing the importance of mathematics for theology and the rest of the sciences, including the productive arts. For Proclus, mathematics prepares intellectual insight. His argument is worth quoted in length: "...thus Plato explains to us many wonderful doctrines about the gods by means of mathematical forms, and the philosophy of the Pythagoreans conceals its secret theological initiation using such veils. Such also is the entire *Sacred Discourse*, the

*Bacchae* of Philolaus, and the whole approach of Pythagoras' exegesis concerning the gods."<sup>54</sup> According to Proclus, as himself puts it, "productive arts 'mathematics' has the rank of paradigm, generating before in itself the principles and measures of what are produced."<sup>55</sup> Geometry, above all, reaches, as general mathematics do, up to true and divine being, "teaching us through images the special properties (ιδιότητες) of the divine orders and the powers of the intellectual Forms... Here it shows us what figures are appropriate to the gods, which ones belong to primary beings..."<sup>56</sup> At the intermediate region of knowledge geometry unfolds and develops discursive principles (διανοητικοὶ λόγοι), while at the level below it examines nature, that is, "the species of elementary perceptible bodies and the powers associated with them, and explains how their causes are contained in advance in its own ideas."<sup>57</sup> For the Neoplatonist Proclus the structure of geometrical demonstrations, which rest on axioms and hypotheses, that is, the principles or 'causes' (both of the world and of scientific discourse) from which the conclusions are derived, must be transcendent, immaterial, and unchanging. Physics itself, then, must begin and derived from these meta-physical causes, the universal and unerring principles, if its mathematical-geometrical laws could be universally true. But when these laws are applied to physical bodies, which are of derivative ontological character and known through sense perception, such laws are deficient, probable and limited in scope. This means that physics has a 'dual' character. The one, the Pythagorean, either concerned with its transcendent 'divine' causes producing the world: the demiurge, the Forms, the lesser gods, soul (as in the 'theology' of *Timaeus*) or a science of the divine itself (as in the *Parmenides*), and the other rejected in the *Phaedo*, "which blinds the eye of the soul, holding as responsible causes as winds and ether according to Anaxagoras." The former, then, the true physics, must be attached to theology, "as nature depends upon the gods."<sup>58</sup> In the case of physics, Proclus claims that the physics of Plato, for reasons just explained, is superior to that of Aristotle. As he puts it, Aristotle concerns himself mainly "with immanent causes, matter and form in nature, and pays less attention than does Plato to the transcendent efficient, paradigmatic, and final causes... and to the extent he neglects the divine presuppositions of nature he diminishes that which gives physics what scientific value can have."<sup>59</sup> Plethon, as we shall see in what follows, will give more details of this "inferiority" of Aristotle.

Finally, George Gemistos-Plethon, who has declared the independence of Platonism and Neoplatonism from Christianity and identified them with Neo-Hellenism and true Humanism,<sup>60</sup> sought to make Plato a living philo-

sophical fountain of truth. He was also eager to point out that Aristotle was inferior of Plato and far from agreeing with the Church. Through his religious, philosophical and moral ideas, Plethon attempted to revive Neoplatonism and Stoicism in order to re-divinize the world and, by appealing to their truth, preserve the eternal divinity of the world. Thus Plethon became the most active and outstanding philosopher dedicated to the revival of Neoplatonism and the survival of Hellenism during the last century of the Empire's existence.

In particular, Plethon, like his precursors Neoplatonists, endeavored to found his philosophical theology and metaphysics in the doctrines of Pythagoras, Plato and the Stoics, where science, philosophy and theology, along with ritualism formed an integral part of the Hellenic daily life. For a more reasonable formulation and justification of his metaphysical concepts, Plethon found it necessary to sanction them by attributing divine status to them.<sup>61</sup> To secure the divinization of his concepts, he appealed to "oracles" of antiquity and the "blessed name" of Zoroaster. On account of this Plethon despised any form of innovation and the introduction of the new metaphysical concepts.<sup>62</sup> The common "axioms," or "doctrines" or "ideas," as the philosopher calls the commonly accepted principles, are claimed to be as old as the universe itself, co-eternal with the *cosmos*<sup>63</sup> which ultimately gods have placed within man's soul in the best possible manner.<sup>64</sup> In his hierarchically arranged categories and attributes of Being which correspond to a parallel arrangement of deities, Plethon preserves the well-known tripartite division of cosmos:

(i) The first super-essential and transcendental one (ὑπερούσιον τὸ "Εν) identified with Zeus and characterized as αὐτοόν, αὐτοέν and αὐτοαγαθός, the father and creator of all.<sup>65</sup>

(ii) The principal agent of creation, the creative or demiurgic principle, Nous, corresponding to Poseidon, the first offspring of God the father; at once the eldest son and second god.<sup>66</sup>

(iii) The third part of the hierarchy encompasses the individuals of the sensible world as well as the social beings. They are the phenomena of the sensible world, the rational and the irrational concrete beings, related to the eternal world of ideas as the copy is related to archetype.

Plethon conceives man as *methorion* in order to show that human soul, man's immortal part, originates in the divine and it is carried to the human body by the celestial gods by means of the carrier of the soul (ψυχῆς ὄχημα). The souls enjoy preexistence as well as eternal life after death, since "they never cease from participating in mortal nature during all the successive stages

in which the cycle recurs."<sup>67</sup> We proclaim," Plethon continues, "an eternity for the soul of man which is not half-measure or lame, but whole and complete...for it is plain that the eternity in both directions of which we speak is far greater and fine thing."<sup>68</sup> Immortality, therefore, for Plethon, means eternity of the soul, which thus is considered to be co-eternal with the Creator destined to assume and resume, alternately and indefinitely, a mortal nature.<sup>69</sup> Hence Plethon's definition of man: "man is an immortal animal, born to communicate with the mortal nature."<sup>70</sup> In other words, man is of composite nature, of the divine and of the bestial nature (θείου τε δὴ καὶ θηριώδους συντεθειμένος).<sup>71</sup>

Man's composite nature is, according to Plethon, the outcome of a similar composition of the universe itself which is composed of immortal and mortal beings (αἰδίων τε καὶ θνητῶν). Man has been devised so as to be a kind of bond (σύνδεσμος) between these two sorts of beings and, consequently, to be their μέθριον.<sup>72</sup> Through this common limit and bond man is elevated above that which is mortal and can be united with the gods, through the line of kinship, in participating to their immortality and to their glorious beauty which man shares with them to a degree and is undoubtedly inferior, but, nevertheless, similar to divine beauty.<sup>73</sup>

Another important service of the admixture of the immortal with the mortal nature in man is its contribution to the harmony of the whole. In respect to this doctrine Plethon writes: "Our soul which is akin to the divine, as immortal and eternal, resides always in heaven which is the limit of the world. Then attached always to a mortal body, the soul is sent by the gods...in view of the universal harmony (τῆς τοῦ παντός ἕνεκεν ἁρμονίας) so that the union of the mortal nature with the immortal nature within us, may contribute to the union of the whole."<sup>74</sup> Plethon's conception of the human soul is an optimistic one; it takes us beyond the pessimism of the Orphic writings and the puritanism of Plato's *Phaedo*. "Though the soul," Plethon writes, "is fastened to the mortal body, she feels no shame for it" (οὐκ αἰσχύνεται); on the contrary she boasts (ἀύχει) for the harmony, that is the union, in which the mortal body (βρότειον σῶμα) is involved; she takes pride in it as if she herself had produced such a function for the sake of the whole universe...in the same way the universe has become one such harmony (οὕτω καὶ τὸ πᾶν εἰς μίαν τινὰ ἁρμονίαν συγκροτεῖσθαι).<sup>75</sup> The purpose of the union is again for the plenitude and the harmony of the great whole (τῆς τοῦ παντός πληρώσεως ἕνεκα καὶ ἅμα εὐαρμοστίας).<sup>76</sup> As a good Neoplatonist Plethon was convinced that the unequal distribution of good and happiness as well as our faults and vices —

which is impossible not to commit on account of our contact with the inferior nature (ὧν οὐχ οἶόν τ' ἦν μὴ μετίσχειν τοὺς τῷ θνητῷ τῷδε κεκοινωνικότας)—does not affect the harmony of the whole; on the contrary, it contributes to it.<sup>77</sup> Man's contribution to the harmony of the *cosmos* is confirmed by the philosopher's theory of measure and harmony.

Beauty, according to Plethon, consists in measure and symmetry. He argues as follows: Beauty cannot be immeasurable or indefinite and constantly increasing. But it may be asked why this is so, when that which possesses more being is always superior? The answer is that that which possesses being in the highest degree is not that which is the greatest in number, volume, or quantity, but that which is most permanently durable; and that is unity, or what is relatively more completely unified.<sup>78</sup> The simple, Plethon points out, is more unified than the complex, the symmetrical than the asymmetrical, the proportionate than the disproportionate. What has a common measure or identical proportion is most completely unified. What lacks measure or proportion in its components lacks unity and consequently will fail to be permanent. So it is measure and definition that the greater degree of being, and therefore of beauty and quality, is to be found, rather than in the constantly increasing and wholly indefinite.<sup>79</sup> The divinized and aesthetic views of the philosopher of Mistra can be better appreciated in their anti-paraphrase to the corresponding de-divinized views of Aristotle and particularly in his criticism of Aristotle's understanding of the first principle, the creator, and the object of art. Thus, in comparing Aristotle's views of God, the creator, with those of Plato Plethon argues as follows:

Plato's view is that God, the supreme sovereign, is the creator of every kind of intelligible and separate substance, and hence of our entire universe...<sup>80</sup> It may be pointed out that Aristotle does make God the end and the final cause,<sup>81</sup> but even this must be regarded as a not very exalted claim and not one worthy of God, if he makes God the end not of the existence or essence of particular things but only of movement and change. If, on the other hand, his reason for not calling God anywhere the creator of the universe is simply that he does not believe him to be such, then he would be guilty of an even graver fault, in that he neither states nor even believes the noblest doctrine of all philosophy, which is common not only to philosophy but to all right-thinking mankind.<sup>82</sup>

The reasons the philosopher of Mistra gives to demonstrate his thesis and that Aristotle doesn't believe in this doctrine are worth to be quoted in full:

Now, I shall show that he does not believe in this doctrine. First, it would not be reasonable, if he accepted this noblest doctrine, that he should never refer to it anywhere in his work, when by contrast he goes on at unnecessary length about such things as embryos and shellfish. Secondly, he criticizes those who postulate a cause of the generation of numbers (meaning a cause as distinct from a time when they came into existence, as is clear from his exposition of their arguments); and he argues against them that 'it is absurd, indeed an impossibility, to suppose the generation of eternal entities.'<sup>83</sup> From this it is clear that Aristotle, like others no doubt, assumes that generation in time must be a necessary consequence of causal generation... But if Aristotle regards our universe as eternal,<sup>84</sup> he clearly could not presuppose its generation; and if not generation, then no creator of it either.<sup>85</sup>

But we, the Platonists, Plethon adds, "place God as universal sovereign over all existing things, and assume him to be the originator of originators, the creator of creators, and refer everything without exception to him..."<sup>86</sup>

Equally de-divinizing is Aristotle's use of the teleological argument concerning nature and art. Aristotle says,<sup>87</sup> Plethon argues, "it is absurd to think that what happens is purposeless unless one can see the agent of it exercising deliberation." On the contrary, says Aristotle, art exercises no deliberation; for if the art were inherent in a piece of wood, it would not be deliberating.<sup>88</sup> But how could, Plethon asks, an art continue to be so called if there were no deliberation prior to its exercises? What is the essential constituent of an art other than deliberation? If that were taken away, no art would remain. How could anything be carried through to an end of any kind without a mind exercising prior deliberation, and indeed preconceiving that end within itself? For if art imitates nature, as Aristotle himself holds,<sup>89</sup> then nature cannot be inferior to art: on the contrary, nature must long beforehand possess that which constitutes art in an even higher degree. And even though there is clearly an element in art which does not deliberate, such as an instrument or a laborer, it is not in them that the art lies but in the master-craftsman. Similarly, if one observes something irrational in nature, then the nature which effectively produces the result does not lie therein; for nature is instituted by God, and God's institution cannot be irrational.<sup>90</sup>

It becomes evident from the above that Plethon's conception of man as *methorion* is an outcome of his Neoplatonic world view. It is also evident that this conception is incompatible with and opposed to the Aristotelian—and the Christian—conception of soul and body. Plethon cannot accept the Aristotelian doctrine of soul, because Aristotle reduces its role to a simple element of

man and ruins the Platonic doctrine of the immortality of the soul, in doubting about its pre-existence as well as its survival. Aristotle's doctrine of intellect is far from being in agreement with his concept of *methorion* because Aristotle contradicts himself in stating that the human intellect is immortal and also that man is ruined after death. Aristotle's conception of God, the creator, as moving cause only, as well as his teleology of nature and art clearly show, from Plethon's Neoplatonic point of view, his de-divinized inclinations. His conception of teleology in nature and art independently of the noetic cause could not but lead to such consequences. Besides, Aristotle contradicts himself when he affirms that nature acts without the intelligent agent (βουλευεται), a thesis which, in reality, is not distinguished from that of mechanism—according to which nature acts accidentally or necessarily—which his teleology tries to avoid.

## The Contributors

**Aphrodite Alexandrakis** earned her Ph.D. from the University of Miami, Florida. She is Professor of Philosophy and Humanities at Barry University in Miami Shores where she teaches a variety of philosophy and humanities courses, and supervises four disciplines. She has been the recipient of two N.E.H. fellowship awards: in 1996 at the University of Tennessee at Chattanooga, and in 1997 at the University of Texas at Austin. She is a board member of the International Society for Neoplatonic Studies, and researches and publishes in Platonic and Neoplatonic aesthetics.

**John P. Anton** is a Distinguished Professor of Philosophy at the University of South Florida; has authored and edited twenty books and published over one-hundred articles. He is currently President of the International Society for Neoplatonic Studies; an honorary member ΦΒΚ, Corresponding Member of the Academy of Athens and an Honorary Doctorate at the University of Athens.

**Leonidas C. Bargeliotes**, born in Olympia of Peloponnese, attended the Gymnasium of Zacharo and the Theology and Philosophy Schools at the University of Athens where he received the corresponding diplomas. He pursued further postgraduate studies in philosophy at the Universities of Norma and Emory (USA) where he received his M.A. and Ph.D. respectively. Since 1975, he has been teaching philosophy at the University of Athens. He is the author, among others, of *Pletho's Criticism of Aristotle, Philosophy and Scientific Research and Philosophy of Science*. At the present he is President of the Olympic Center for Philosophy and Culture and is co-editor of the journals *Skepsis* and *Ifitos*.

## PREFACE

It would be a mistake to regard Neoplatonism as only a form of mysticism. Although it is a way of philosophizing that points to a form of knowing that is beyond dialectics, it does not have any mystical elements in its own dialectics. Its mysticism is to be found at the end of its philosophical progression and is not inherent in its epistemology. Philosophical knowledge, as well as scientific and artistic knowledge, are forms of discursive knowledge and, as such, have no mysticism whatsoever involved in them.

Neoplatonism also differs *logically* from the Platonism of the *Dialogues*. It could also be labeled "Aristotelian Platonism," since both Plotinus and Porphyry were highly influenced by Aristotle and his criticisms of Plato. Although Plotinus returned to the same main theme emphasized by Plato, he made major concessions to Aristotle, and especially to his logic. This tendency is even more pronounced in the writings of Porphyry, who was so enamored of Aristotle's logic that he emphasized it in his own writings and, in so doing, set the stage for the formation of another kind of Neoplatonism, namely, ■ type that focuses upon the logic and categories of Aristotle. A case could be made, I think, that there really have been

two forms of Neoplatonism operative in the history of Western philosophy, namely, the Neoplatonism (or Plotinism) of Plotinus and the Neoplatonism of Porphyry; and, by and large, the latter has been far more influential than the former.

A close look at the history of Neoplatonism will reveal that hardly any later Neoplatonist followed Plotinus exactly. From Porphyry to Dean Inge, most "Neoplatonists" have been neo-Neoplatonists, deviants who have abandoned parts of Plotinus' system or departed to some extent from his logic or categories. Add to this the tendency of various Jewish, Islamic, and Christian writers to take only portions of his thought and combine it with their own to produce some hybrid variety of Neoplatonism, and we might be led to ask "What is normative in Neoplatonism?" To what degree must a follower of Plotinus remain true to his views in order correctly to be labeled a Neoplatonist? The answer, I believe, is to be found in the degree to which they follow his logic and epistemology. When they depart radically from either of them, they should no longer be labeled Neoplatonists.

In defense of the deviants, it might be noted that Plotinus was essentially a synthetic thinker, and synthetic thinkers are necessarily dated. His system was the product not only of his own philosophical methodology, but also of his own dated understanding of science, art, religion, and philosophy. Those in later times who have recognized his remarkable genius as an artist of metaphysics and have chosen to label themselves as his followers have usually sought to compliment him by complementing him. This they have done not by slavishly reproducing his own system, but by updating or correcting it or by producing their own versions of it. They have sought to duplicate his vision of the unity of being; and they have understood that this must occur as a synthetic function of their own thought and within their own intellectual and historical context. The disciple of Plotinus need not necessarily take Plotinus' own system per se as final, but one must emulate his logic and epistemology.

However tolerant we may wish to be toward the deviants in the Neoplatonic tradition, the fact remains that Neoplatonic logic is significant in determining what we now call "Neoplatonism." The nature of Platonism had been debated for six centuries prior to Plotinus and the Middle Platonists, and one of the major factors in the evolution of later Platonism was the accumulated impact of Aristotelian and Stoic logic. Distinctions can be made between the logic of Plato, the logic of Aristotle, the logic of Plotinus, and the logic of Porphyry. Neoplatonism, as a form of Aristotelianized Platonism, involves making certain important concessions to the logic of Aristotle. Plotinus rejected Aristotle's categories, substituting his own. He also rejected a portion of his logic. Porphyry, in turn, decided that Plotinus' categories and logic were inadequate and relied heavily on both Aristotle's categories and logic in his own thought, especially in dealing with the physical or sensible world. If the case can be made that there is a sufficient difference in the logic of Plato and Plotinus to justify the term "Neoplatonism," it can also be said, I think, that there is a sufficient difference in the logic of Plotinus and Porphyry to serve as the basis for defining and delineating the various historical types of Neoplatonism. At issue is whether there is only one prevailing Neoplatonic logic or two varieties.

The essays in this volume do not deal sufficiently with all the necessary questions entailed in a study of Neoplatonic logic, but they do provide a beginning for a consideration of some of them. They were not commissioned and are not products of single conference, but were presented at various meetings of the International Society for Neoplatonic Studies in the United States and Canada during the last four years. They have been selected because they focus, to some extent, upon the nature of Neoplatonic logic and methodology, broadly conceived.

The title, *The Structure of Being: A Neoplatonic Approach*, has been chosen in order to emphasize that Neoplatonism is but one among many efforts to suggest how being may be conceived to be structured. More precisely, Neoplatonism is an effort to suggest a logic of being, namely, how being might be conceived to be logically structured. Although some elements of it are highly speculative, the logic on which Neoplatonism is based is not. It is the aim of the editor of this volume to draw attention to the importance of Neoplatonic logic and methodology, both in the general definition of Neoplatonism and in determining the nature of particular historical instances of it. A very brief description of the fourteen essays now follows.

In the first essay J. N. Findlay suggests that the logical peculiarities of Neoplatonism still fit into the general logic of Platonism, but he indicates certain respects in which the logic of Plotinus goes much further. He insists that it cannot be viewed as an ordinary logic of propositional or functional calculus, but must be seen as a quite nonordinary type, which he describes to some extent. The second essay by Richard M. Martin contains a sketch of a formal logicometaphysical system that indicates some of the basic features of the system of Plotinus. The third essay by John P. Anton investigates the concept of hypostases in the *Enneads* and defends the position that the One is the first hypostasis, a view strongly denied by the late John N. Deck in the fourth essay. (Deck holds that the One is above hypostasis.)

The One is also the subject of the fifth essay by Eugene F. Bales. Bales notes that Plotinus uses three modes of discourse, (1) meontological, (2) ontological, and (3) paradoxical in discussing the One or the Good, and suggests that the view that the One radically transcends being is inadequate. In the sixth essay Michael F. Wagner explains Plotinus' theory of "Vertical Causation," namely, that the causes of bodies are not other bodies, but the Forms. He further elucidates Plotinus' position that real explanations appeal to forms rather than to interactions between bodies and that the Forms determine the order of our concepts. The seventh essay, by Christos Evangelou, establishes the thesis that Plotinus' criticism of Aristotle's categories is based on ontological, and not logical, grounds.

The eighth essay, by John Fielder, is an analysis of the concept of self-predication as it applies to Plotinus, whereas the ninth essay, by Jonathan Scott Lee, is a study of participation (or eidetic causation) as it relates to omnipresence and monopsychism in the *Enneads*.

Professor Robert Brumbaugh, in the tenth essay, suggests that Neoplatonic philosophy is exactly what contemporary mathematicians are looking for in their discussion of the foundation of mathematics. He further indicates that Cantor's set

theory fills a definite place in the Platonic curriculum suggested by Plato in *Republic* VII and developed further by later Platonists. He further opines that Proclus has more mathematical talent than he is usually credited with, especially in algebra.

The eleventh essay, by Carl R. Kordig, explores the mathematics of the mysticism of Plotinus and Proclus, concluding that the One must be said to have properties, but quite special ones, and not the ones we apply to ordinary, finite objects. He also concludes that the logic applicable to the One cannot be an ordinary logic. In the twelfth essay, Ronald Hathaway takes a close look at the logical anatomy of Proclus' proof and draws some conclusions about his general model of proof. Essay thirteen, by Evagheios Moutsopoulos, focuses upon the idea of falsity as it occurs in Proclus, concluding that the main cause of falsehood is inherent to multiplicity and the conditions relating to it.

The fourteenth and final essay, by Leo Sweeney, contains an intensive analysis of the logical structure of being in Proclus' *Elements of Theology*. He suggests that in Proclus' cosmos two sorts of spontaneous and necessary causality are operative: participation, by which perfections come to be present in participants, which thereby are completed and perfected; secondly, a prior and nonparticipational process, by which the participated perfections themselves and their participants originate.

## *The Logical Peculiarities of Neoplatonism*

J. N. FINDLAY

I have chosen to address myself in this essay not to some historical or factual question, but to the philosophically important topic of the logical peculiarities of Neoplatonism. These logical peculiarities may be described in terms of pervasion and interpenetration, of sympathy and remote control, of multiple location, of elastic and variable identity, of iridescent variation of aspect, of differentiation without difference, and of potency more actual than act. Before, however, I go on to consider these peculiarities, I shall observe that the logical peculiarities of Neoplatonism are in large part simply the peculiarities of Platonism, and of the fundamental inversion, the "Eidetic Turn," as I may fashionably call it, in which Platonism consists. This inversion is one in which types and characters lose their predicative character, and are erected into the true substances or subjects of predicates, while their concrete instances are suddenly demoted from their substantial status into the new status of dependent instantiations or particularizations. We, in short, no longer take it that this individual or that is human and just, but that Manhood and Justice are "thisied" or "thatified," are "herified" or "therified," are "nowafied" or "thenified" in this or that case. By such an inversion, generic

and specific features become the true and primary cases of identity, an identity unaffected by multiple location in space, or changing location in time, and which is capable of a persistence unmodified, or intrinsically unmixed with what is irrelevant, such as we never postulate in the case of instances.

It is, however, also an inversion that will permit us to make specific and generic natures as specific as we wish, so as to include whatever is discoverable and graspable in the individual, and also to leave our "natures" unsaturated in the Fregean sense, so that they permit saturation or completion in a number of alternative ways. It is further a logic in virtue of which universal types or patterns become, in a queerly inert, effortless manner, the "true causes" of their own instantiations, since it is by their "presence" in their instances, or by the "sharing" of their instances in them, that those instances are made what they are. Instances have in fact nothing that is intelligible and seizable, nothing that can be spoke of or pinned down, except for what they thus instantiate or exemplify. We try to dig down to their dark underlay of  $\chi\omega\rho\alpha$  or spatiality, but can only do so by divesting ourselves of all conceptual lucidity, by deluding ourselves with a spurious argument to the effect that whatever exists must be somewhere, with the "somewhere" being only the indefinite possibility of instantiation that we feel must be there if instances are to have any basis at all.

Neoplatonism further takes over from Platonism the marriage between general patterns and cases of the Good or the Intelligible: the true substances of logical subjects are all special forms of Goodness, cases involving no mere congeries of elements but an ordered, unified pattern in which diversity is wholly subordinated to unity, and the tendency to exceed or fall short is so hemmed or curbed that a single set of measures works everywhere. This belief in well-ordered  $\mu\epsilon\tau\epsilon\theta\omicron\rho\eta\varsigma$  further obtains whether we are dealing with the natural numbers, the harmonic proportions, or the regular geometrical figures—the solids or patterns of movement—until we rise to the self-moving patterns of living creatures in which substantial reality goes hand in hand with beauty. Neoplatonism in fact goes further than Platonism in its close marriage of substantial being with value, for while Plato is willing to accord some sort of parasitic, secondary status to a  $\pi\alpha\rho\acute{\epsilon}\chi\beta\alpha\sigma\iota\varsigma$  or a negation, Neoplatonism is inclined to attribute all deviation, privation, or factitious combination to the inherent defects of instantiation, and to the "matter" that is the ultimate wall of darkness in which the eidetic illumination terminates.

Neoplatonism further takes over from Platonism the view of there being, in the higher cases of self-movement, an inherent affinity, not merely with the specific life patterns that the instance embodies, but also with the whole range of the Eide which, as Soul-instances, they can know. Each higher case of Soul is therefore also an instance of Mind, and, as such, shares imperfectly in the changelessness of the total eidetic system, persisting throughout the whole flux of instances since it is unable to step out of flux altogether.

In all these respects Neoplatonism simply takes over the logic of Platonism, and we may commend it for freeing us from all the anxieties and perils of particularism: the impossibility of justifying our search for unifying patterns in the welter of particular cases and our faith in their continued presence in further cases,

and our faith, also, in a general trend in things towards well-ordered integration, which is not only presupposed by all scientific research, but also underlies all self-restraint, all courage, and all justice. To believe that principles of order are the mere dependencies of what happens to exist, rather than the source and guiding force of the latter, is to surrender oneself to the boundless demoralization of the typically modern outlook, which stands as pathetically helpless as Saint Sebastian while the arrows of chance afflict it from every side. These arrows now stem from scientific laboratories rather than from faithless men.

I do not, however, wish to dwell on the general merits of Platonic logic, but to consider the respects in which Neoplatonism goes further than it does. This it does in stressing the *unbroken continuity* of the eidetic system, from its most generic to its most specific phases, and from what is most powerfully positive in it to what is most shadowy and negative, and also from what is most definitely this or that in it, to what is most definitely something quite different. The stress on eidetic continuity is, also to be found in Plato. The *Phaedrus* compares a genus to a living body that can be cut at many places indefinitely, though there are always some cutting points that are natural and right. The *Republic* tells us of an eidetic system in which all relations will be as eidetic as the terms that they connect, while the *Parmenides* provides a specimen of an indefinite multiplicity nesting within the most absolute simplicity and unity. But in Neoplatonism we operate throughout with hypostases that shade into other hypostases, that in fact *are* other hypostases operating in a slightly different medium or manner, or that are said, with a final access of approximation, to be separated from other hypostases by nothing but difference, as if this were the most inconsequential sort of separation that there could conceivably be. Yet this stress on continuity goes together with a profound recognition of gulfs and distances: the higher hypostasis has a self-sufficiency and an independence from the lower hypostasis that the lower hypostasis never can share. In being a dependent offshoot of the higher hypostasis, it is separated by an ontological gulf from that of which it is the offshoot. And, likewise, in including other forms of being as its necessary context, it also excludes them from the intrinsic nucleus that makes it what it is. The structure which results is one where everything shades into everything, yet nothing is blurred: it realizes among Eide that essential mystery of motion in which positions never can be in touch with other positions, and yet there is no such thing as a break or division among them. The mathematical theory of Real Numbers is something that *could* have been Neoplatonically conceived: as it stands, it only reveals the complete powerlessness of separative thought.

I should, however, like to elucidate my view of the Neoplatonic continuum by trying to set forth a typical account of Neoplatonism that would lend itself to picture-thought, and that soon turns into a strange fable. On this account the Neoplatonists were silly enough to treat Unity—the most abstract of categorial attributes that implies only that something is something and not nothing—as if it were not merely something highly positive, but also a peculiar instance of itself, having no other attribute but being purely and resolutely single. This self-existent singularity and uniqueness had no awareness of itself or of anything else, and it

had not the slightest tendency to seek relief from its single state by the smallest exercise in self-duplication or differentiation. Nonetheless, by some strange necessity that had nothing to do with a need, its very needlessness precipitated the existence of something which was more than resolutely single, which was inherently prone to distinguish itself as subject from something else as object, and to do this over and over again, so that it was confronted with a whole offspring of distinct phases, which were in fact infinite in number and embraced all that could be or be conceived. This spawning of a kaleidoscope is in fact the substitute for a vain effort to penetrate the One as object. The Second Hypostasis tries to conceive the One in its unity, but can only succeed in splintering it into a host of ones, whose participation in the One makes them an organized complex whole, but which, in being organized and complex, are also everlastingly and absolutely separate from the One itself. The Second Hypostasis is accordingly a seeing, intellectual one, a *Nous* or Intelligence, and what it sees is the hierarchically arrayed Eide, its coeval companions. In seeing them it becomes a seer, and as such capable of seeing itself in them, and them in itself. The life of the Intelligence is then described in phrases of great literary beauty which, seen in the sort of logic that we are now using, is no more than a *Gandavyūha*, a very lovely fairy tale. In the heavenly regions there are many distinct *vóes* or *voī*, one for each of us and for the celestial agents as well, but they are all eyes and vision, and see each other as such: the situation rather resembles a nightmare I had when I was a child—I awoke to see millions of shining eyes looking at me from every direction. And in this heavenly region every eidetic shape carries the whole eidetic system in itself, while emphasizing its own peculiar contribution to that system. The *voī* in that region vainly attempt something like locomotion, but the earth on which they tread is rather terrifyingly alive, and they carry their starting point with them wherever they journey. The condition in which they subsist is described in terms so superlative that one feels rather like someone staying in some snow-white Alpine hotel surrounded by scenery similarly snowy. It is, in short, as free from the suffering, the patience, and the labor of the negative as are the much admired writings of Benedetto Croce. Heracles (up there) remembers nothing of his labors, so that there is little reason for him to retain his peculiar corner in the poetic mansions. I do not, however, wish to cast ridicule on some of the most brilliantly beautiful tractates in human literature, but only to stress a single point: that it can be read as an extraordinary travelogue or piece of science fiction, and that the question then emerges whether we really want to believe in such an ecstatic intellectual state, whether we really want such a beautifully blurred condition to exist. Would it not be preferable to be in one of Fra Angelico's heavenly assemblies, with their bright-checked saints and angels and golden trumpets, or in the select group of the upper 400 to whom Beatrice presents Dante? It is the feeling that what Plotinus describes so ecstatically is no more than a myth or a fairy tale that leads people to think that he is not worth studying, exactly what Prince Eugene and the court ladies may have felt when they read Leibniz's charming treatises about the Monads.

The so-called process of emanation, which I prefer to call Irradiation or

περίλαμψις, and which has led from the One to the *Nous*, can also be seen as a magical but factual process. There is the famous passage where Plotinus exploits its analogy with the way in which fire radiates warmth to environing objects, or in which odorous objects diffuse scent into the surrounding air, and so on, which suggest that it is merely a marvellous fact that hypostases should shed or drop exhalations about them which try to resemble them but which also necessarily fall short of them. And while this exuberant burgeoning seems vaguely exciting, the fact that it always results in something inferior is vaguely depressing: it is as if one's children were always smaller and stupider than oneself, until all generation ended up in producing dwarfish idiots. One is inclined to echo Plotinus's occasional regret: how much nicer it would have been had there been no such declining procession, if only everything had remained in its first primitive condition. And what a pity that there is this strange ontological necessity that corresponds to no need, but which gives rise to such deep need in the lower hypostases. The doctrine becomes even stranger when we are told that the submission to this necessity was also perfectly free. What, we are inclined to ask, possessed the One to let anything derive from itself?

The procession does not cease to excite questions as we go on to its next stage, the procession of the World Soul. Here the decline is to succession, the piecemeal running through items that were previously given together, and the use of λογισμοί, reasonings, where previously all was accomplished sight. It is not clear what advantage is secured by falling out of eternity into time, and how such a dismantled state as one that involves change and flux could have sprung from the all-togetherness of eternity. The Third Hypostasis, however, exhibits further declensions than the merely temporal: it proceeds to a certain limit and not further, and there is confronted by an ambient darkness which is merely the shadow cast by its own light. But it is not content to circulate happily within this limit: it yearns to go forth and build empires in the shadow, to shed the light of its missionary countenance in the darkest Africa which calls itself Matter. This darkest Africa has, moreover, a strange aptitude or ἐπιτηδειότης for extension, bulk, or division into parts: it yields in a short time a colonial diaspora to which copies of eidetic originals are exported, and a whole set of complexly organized structures built up. Among these structures will be the organized bodies of men and animals, and to these structures certain less-enlightened sorts of soul will be strangely attracted, desiring audaciously to have something they can count as their very own, and that they can manage with considerable departures from the august patterns laid up at higher levels. The rest of the story involves the sinking of many souls into deplorable states of defect and excess, and their close identification with their perishable bodies, until they become wholly forgetful of their superb sister the World Soul, who runs the heavens so suavely and so masterfully, and even more forgetful of the perfect Intelligence and the supreme Unity from which she springs. The sad process of decline, however, can be reversed: earthly beauties can lead souls on to the beauties of laws and virtues and institutions, these on to the beauties of intelligible patterns, until the soul, completely absorbed into its *Nous*, and united with every other *Nous* and with every object, can divest itself of

the last traces of specificity and individuality, and can come into coincidence with the partless One, to which it owes every vestige of its being, its character, and its organized unity. There is, however, something very dubiously σεμνόν, glorious, or sacred in this last ἔνωσις or ἁπλῶσις: it seems a fine goal to strive for, but is it at all fine to get there? Personally I find the full wheel of πρόοδος and ἐπιστροφή, when conceived in the fabulous manner I have just described, a little more depressing than the celebrated Buddhist wheel of birth and death: the latter at least goes on to perpetual novelty, while the former merely cancels out its original, inexplicable mistake. The depression I am describing was one that I myself experienced in my early years of adolescent mysticism: it rather put me off mysticism for a large part of my later life.

I wish to suggest, however, that there is something deeply and fundamentally wrong about the picture of Neoplatonism that I have just sketched, and that what is wrong about it is the *logic* with which it has operated, which is the logic of the propositional calculus and the functional calculus, especially when these are restricted extensionally and avoid all modalities and quantifications over functions, and so on. The logic I have used in it is, in fact, the logic of ordinary talk about concrete individual things and persons and what they are like, how they stand to one another, or what they do to one another. It is the logic to which classical expression was given in Wittgenstein's *Tractatus*, with who can say what sense-destroying results. It is also the logic of some of the less-inspired utterances of Plotinus, as when he talks nostalgically of a return to the One, or more extremely, of the wise refusal to leave the parental home altogether, or as when he treats matter and body as positive, malefic agencies that we must try to foil or circumvent. In this bad logic there are, first of all, individual bodily or psychic things which are neither conceived as being more or less optionally and variably carved out of the totality of being, nor as capable of fission or coalescence, nor of combination or resolution into unities as genuine as they are. And these instantial things are then sorted out into classes by certain common characters, and arranged into patterns by dependent relations, while all the time all real agency in the world is a function of the instantial things in question. The picture is irresistible: it is what the philosopher sees when he looks at his own hands and the objects arranged all over his desk, or what the housewife sees when she overlooks the various bottles and packages in her crowded food cupboard. To treat Neoplatonism as some exponents have treated it is to apply just such a logic to it, to describe it as a series of shelves and layers in some decayed pantry, with strange juices dripping down from the upper shelves to the lower, and a concurrent rising of strange effluences and odors from the lower shelves to the higher. This may be what the universe is like, but what, one is inclined to ask, is the reason to suppose it is so? And what reason have we to be pleased that this is the way it is?

The logic with which we have to understand Neoplatonism is, however, a totally different logic from the ordinary. It must be a logic in which substantiality and agency reside in the generic or specific pattern and never in the poor instance, and it is, moreover, a logic in which the hierarchical rise from the more specific to the more generic; though it may lessen determinateness, it also deepens and

widens *power*. The true genus, which is, of course, not any and every factitious general concept dreamt up by some arbitrary classifier, contains all its subordinate species δυνάμει or in power, and holds together in a rich unity what must necessarily fall apart in the species and the instance. It is infinitely more substantial and more concrete than its species or its instances. And the Neoplatonists, while they sometimes defer to the Aristotelian subordination of potency to act, really invert Aristotle altogether, as every eidetic philosophy must do. The potency of the genus, we may say, in a rather Irish fashion, must have a higher degree of actuality than the one-sided, limited, so-called actual instance. To be Justice itself or Life itself is to be a richer, more various, more enduring thing than to be a just act or man, or a living organism that endures for a season. There is, of course, ■ potency that connotes defect or privation, and this is the potency above all possessed by the poor dead lady Matter, who is nothing at all except insofar as she gets decked out with costume jewellery imitated from eidetic originals. And there are similar negative potencies in the stupidity or ignorance or confusion of souls functioning at much higher levels of being. But true δύναμις is also true ἐνέργεια, and a higher ἐνέργεια than the limited ἐνέργεια of the species or instance.

This according of power to the genus, of course, reaches a maximum when we climb to the supreme transcendental, the One or Good. *It* may not be any determinate sort of good thing, and *It* may not be an existent instance of any sort whatsoever, but it is the unlimited power of all specification and all instantiation, and so more momentarily and conceivably actual than the most remarkable species or individual that we can possibly conceive. And we may note further, that the One of Neoplatonism not only *can* exercise its boundless power, but also *has* exercised it in the countless species and instances that have streamed forth from it, and so has in a sense given proof of its infinite intrinsic riches. And the exercise of this power, though corresponding to no inner stirring of need, and though free and not compelled, is also ontologically necessary. The One could not be the all-sufficient principle of Unity that it is unless it could specify itself in countless eidetic shapes, and unless these in their turn could instantiate themselves in the countless more-or-less imperfect cases that we encounter in this world. And we may note further that, although the complete vision of the ordered eidetic shapes (and the soul's unending endeavor to arrive at this vision) always falls short of envisaging Unity itself, they in effect know it as perfectly and as concretely as could be desired. They achieve everything except arriving at the terminal obelisk in which the whole park of being centers, but they know that and what it is, and where it lies in relation to the whole well-laid-out estate. They know it as the Cantorian transfinitist knows what Aleph is in knowing that it is the number of all the finite cardinals—the number of a clearly conceived, rationally ordered series of numbers—which is, nonetheless, not one of their number. There is, therefore, reason in saying that although the One does nothing at all, it in a sense does everything that anything else only seems to do, and that although it is not aware of itself or of anything else, it knows itself in all the minds and souls that know anything at all, and that all these only unfold the infinite possibilities that lie

locked up in itself. And of what these minds and souls do not conceive or know, the One has knowledge in their dim sense of something beyond all their conceptions, and in *being* what they cannot even dimly conceive.

There are similar interpretative changes necessary if we are to understand the procession of the Soul from the *Nous*. If we think of the *Nous* as some actual mind that eternally envisages everything, we have changed it from being Mind itself into being *a* mind—an individual or personal intelligence—and if it is such, it has simply become identical with some sort of a World-Soul of a curious timeless type. In such a supreme thinking unity we could not share: it would be a superior mind from which we could perhaps learn, but not an intelligence in which we could participate. The correct interpretation of the *Nous* is not, I am sure, that it is *a* very special, timeless intelligence, but that it is Very Intelligence Itself and, as such, a power present in all souls. These souls in their concentrated insights and argumentative ratiocinations are the limited actualizations of its eternal vision, while it, as their power, has a higher actuality than any thinker or activity of thought. It is the eternal pattern towards which active thinking only strives. Its instantiation in souls and their intellectual activities, including those of the supreme Soul of the cosmos, is therefore an ontological necessity, though not a need, in its nature. In the World Soul and in our inferior souls and minds, it shows forth its substantial riches, and thinks itself—not in and for itself, but in and for them. Its unthinkingness is, however, merely a consequence of its being Thinking itself, and not a particular thinker or case of thinking. It can only be in the World Soul or in our souls that it can actually think itself.

Now I know that the Eckhartian and Hegelian propositions that I am affirming are not clearly asserted by Plotinus, any more than Christian orthodoxy has ever adopted a view according to which the Father and Son fulfill themselves in the Holy Spirit, though I think this may have been in the mind of Jesus when he saw the supreme sin in the rejection of the Holy Spirit. What I am, saying, however, is that the Neoplatonist picture only makes complete sense if it is filled in the manner I have suggested, which alone conforms to its peculiar logic. That peculiar logic will also demand that we cease to divide the noetic cosmos into the rigid genera and species favored by antique classification: the eidetic realm involves complex unities of a loosely affiliated and a closely affiliated kind, of a richly substantial and of a highly abstracted sort, of a remotely disjoined and scattered as well as of an eidetically neighboring sort. It has, in short, all the open texture and variability of alignment that occurs in ordinary discourse. Plato shows some awareness of these differing types of eidetic pervasion in some key passages in the *Sophist*, and Plotinus and other Neoplatonists probably did much the same. The eidetic realm may have many crisscross divisions and alignments imprinted upon it, and the same applies to the cases and classes of cases in which it is instantiated.

If I now turn to Soul and souls, it is here that I think the various ravishing descriptions of Plotinus have their appropriate place. There are no thrills or journeys in the world of the *Nous*, since this world can find no place for so temporal a thing as a thrill or a journey. The excitements of intelligible beauty are the excitements of the soul functioning noetically: it is only the soul that can experi-

ence noetic enlargements. I imagine that every scientist or artist has these noetic excitements. In the same way the ecstatic experience of approach to the supreme Unity and of the retreat from the same are experiences in the life of Soul, and it is in souls that Soul is thus ecstatic. Even if there are experiences at the point of union, they are *qua* experiences, soul-states, and it is for the soul that they are something *σέμνόν*, awe-inspiring: *qua* conditions of the One there can be nothing wonderful or sacred about them, if indeed it is fit to talk about them at all. Saint Teresa and Saint John of the Cross have recorded experiences that were certainly soul-states, since in them there was still something that was the small bucket lost in the larger volume of water or the lesser flame lost in the greater. The Upanishadic description of a man united with Brahman as resembling the state of a man in the embrace of a beloved wife obviously describes a soul-state: there is certainly a residual duality in the conjugal embrace. And the descriptions of Nirvana as an island, a refuge, and so on, obviously describe some soul-state: they are descriptions of a happy arrival, not of what happens when one gets there. I am forced, however, to believe that, with the vanishing of Soul or Ahankara, Brahman himself will cease to be Cit and Ānanda, though he may very well continue to be Sat. I need not document the lower regions of psychic activity. It is in the enlargements of experience precipitated by the vision of beauty, by insights gained into eidetic relations, by the deep love that enables us to see another as if he were ourselves, that we rise to the threshold of *Nous* and the more august threshold of the One.

I wish to conclude this paper on what you will think an unexpected note. I am unable to believe in the World Soul of Neoplatonism because Copernicus and his successors, as well as the recent results of planetary exploration, have undermined the foundations of any astral theology. The starry heavens are very far from declaring the glory of God, and if we desire evidences of his presence, I fear we must seek them in the moral law within, or in the aesthetic and intellectual laws that are likewise within. I believe, however, in the Holy Spirit or blessed other-worldly Soul, which is beyond personal difference, and which carries within itself as transcendental regulators both the Noetic Order and the Unity beyond it, and which, while active in space and time, brings the One and the *Nous* to bear upon everything. In saying this, it must not be imagined that I am becoming a humanist or a relativist of some sort: I believe in the austere sovereignty of the Eide and in That which is beyond eidetic difference. And in making these principles regulators of Soul, I am not demoting them to some inferior status—I believe that to be regulative is to enjoy a higher ontological status than to be what is called constitutive, and that while the supreme Hypostases are beyond the imperfect realm of existence and actuality, they are the infinitely powerful and perfect source of the latter, and so more real and important than anything instantial. The sort of mysticism that I think follows from a true understanding of the logic of Neoplatonism, accordingly, is a mysticism that only seeks to ascend to the noetic and supranoeitic heights in order to return from them, and which sees those heights as sources from which transcendent light streams, and to which light one can render oneself pervious and transparent, rather than as regions where it is at all desirable to go or

stay, except when one is finally handing over the task of existence to others, having made one's own final contribution to it. I believe that the positions I am advocating accord with the teachings of Jesus and Paul, though there is much in Mahayana Buddhism that accords with them also, for example, the belief in a realm of essence which is also down here, in a Nirvana which to accomplished insight is identical with Samsara, and in the interpenetration of all natures in Buddha Vairocana, who is very much the sort of highly charged guiding Spirit in whom I should like to believe. I hope in conclusion that you will look kindly on my many heresies and syncretisms, and that I may perhaps help you to frame your own viable and inspiring interpretation of Neoplatonism instead of a merely mythical and pictorial one.

## *On Logical Structure and the Plotinic Cosmos*

R. M. MARTIN

The primary aim of this paper is to attempt to bring what in essentials is the great cosmological vision of Plotinus into harmony with contemporary science, including logic and mathematics. The brief sketch of a logicometaphysical system to be presented is thus thought to provide an at least rough approximation to some of the basic features of the Plotinic system. We need not worry as to how exact the fit is. No doubt it is very loose in some respects and perhaps too tight in others. Enough will be shown, it is hoped, to suggest that with suitable emendations and extensions, however, the approximateness may be lessened and the fit made more comfortable throughout.

To attempt to get the exact fit, incidentally, is eminently "dialectical" in the Platonic—and no doubt Plotinic—sense. A. E. Taylor commented many years ago that "what the *Republic* calls "dialectic" is, in principle, simply the rigorous and unremitting task of steady scrutiny of the indefinables and indemonstrables of the sciences, and that in particular . . . [Plato's] . . . ideal, so far as the sciences with which he is directly concerned goes, is just that reduction of mathematics to rigorous deduction from expressly formulated logical premises by exactly speci-

fied logical methods of which the work of Peano, Frege, Whitehead, and Russell has given us a magnificent example."<sup>1</sup> It is thus eminently dialectical to apply Plato's ideal to the Plotinic system itself. Recall also Plotinus' own comment (*Enneads* I.3.5-6) that dialectic is "the precious part of philosophy: in its study of the laws of the universe. Philosophy draws on Dialectic much as other studies and crafts use Arithmetic, though, of course, the alliance between Philosophy and Dialectic is closer."<sup>2</sup> Of course we must not force the letter of logical theory construction upon either Plato or Plotinus, so much as note similarity of spirit across the centuries. Recall also the remarkable comment in I.8.1 where Plotinus writes: "Our intelligence is nourished on the proposition of logic, is skilled in following discussions, works by reasonings, examines links of demonstration, and comes to know the world of Being also by the steps of logical process, having no prior grasp of Reality but remaining empty, all Intelligence though it be, until it has put itself to school." Well, let us put ourselves to school on what is, in essentials, the Plotinic system.

Let "One" be a proper name for the Plotinic One or Unity, and "AllSoul" for the Psyche or the All-Soul. And let "Int" be a one-place predicate so that "Int  $x$ " expresses that  $x$  is a form or a member of the Intelligible Realm of *Nous*. And let "Obj  $x$ " express that  $x$  is an object of the lower Cosmos, of the lower world of Nature or of the Sensibles, among which are included human bodies. Roughly, then, we have these four expressions for the four Plotinic levels: two of them, note, are proper names and two of them are predicates. The proper names are for the primary unities, and the predicates are for multiplicities, which, however, also have a kind of unity—a secondary unity, let us say. With this notation in mind, let us reflect now upon (1) the logic of emanation; (2) the role of modern set theory with sets construed as elements in the Intelligible Realm; (3) how the lower souls may be construed modally as constructs in terms of "AllSoul"; (4) the character of the "Plan contained in the Reason-Principle" whereby the All is governed; and, finally, (5) the notion of the return to the One, the flight of the alone to the Alone.

Let us consider first the logic of emanation, which is no doubt best construed in terms of a dyadic relation. Let " $x$  Em  $y$ " express that  $x$  emanates into  $y$  or that  $y$  is an emanation from  $x$ . The exact behavior of this relation is, of course, where we wish to focus our inquiry. Let us first specify a few very simple principles (*Pr*) concerning emanation. First, the relation Em is presumably *totally irreflexive*, *asymmetric*, and *transitive*. Thus

- Pr1.*  $\vdash (x) \sim x \text{ Em } x$ ,  
*Pr2.*  $\vdash (x)(y)(x \text{ Em } y \supset \sim y \text{ Em } x)$ ,

and

- Pr3.*  $\vdash (x)(y)(z)((x \text{ Em } y \cdot y \text{ Em } z) \supset x \text{ Em } z)$ .

Also the four realms clearly are *mutually exclusive*, in the sense that

- Pr4.*  $\vdash \sim \text{Int One} \cdot \sim \text{One} = \text{AllSoul} \cdot \sim \text{Obj One} \cdot \sim \text{Int AllSoul}$   
 $\cdot \sim \text{Obj AllSoul} \cdot \sim (Ex)(\text{Int } x \cdot \text{Obj } x)$ .

And all four domains *exist* in appropriate senses, so that

- Pr5.*  $\vdash E! \text{One} \cdot (Ex) \text{Int } x \cdot E! \text{AllSoul} \cdot (Ex) \text{Obj } x$ .

Concerning the One we have some special principles as follows:

- Pr6.*  $\vdash (x)(\sim x = \text{One} \supset \text{One Em } x)$ ;  
*Pr7.*  $\vdash \sim (Ex)(\sim x = \text{One} \cdot (y)(\sim y = \text{One} \supset x \text{ Em } y))$ .

*Pr6* states that everything other than the One is an emanation from the One, and *Pr7* that there is nothing other than the One from which everything other than the One emanates.

Some immediate consequences of these principles are that

- Pr8.*  $\vdash (x)(\text{Int } x \supset \text{One Em } x)$ .  
*Pr9.*  $\vdash \text{One Em AllSoul}$ .

and

- Pr10.*  $\vdash (x)(\text{Obj } x \supset \text{One Em } x)$ .

But the following also hold:

- Pr11.*  $\vdash (x)(\text{Int } x \supset x \text{ Em AllSoul})$

and

- Pr12.*  $\vdash (x)(\text{Obj } x \supset \text{AllSoul Em } x)$ .

Every intelligible emanates into the AllSoul and the AllSoul into every object. No object, however, emanates into anything, so that

- Pr13.*  $\vdash (x)(\text{Obj } x \supset \sim (Ey)x \text{ Em } y)$ .

Concerning the One, very little can be truly said or not said in terms of Em! Thus

- Pr14.*  $\vdash \sim F \text{ One}$

for most predicates  $F$  not containing Em. Of course in a fuller discussion we shall have to be more specific here about the  $F$ 's, how they are constructed, and so on.

Concerning the intelligible realm, however, a good deal can be said, and it may be of interest to try to view it in terms, partly at least, of modern set theory. Sets are thought by many contemporary theorists to constitute par excellence the very prototype of intelligible entities. Some even go so far as to say that they are the *only* such objects, but this contention might seem somewhat extreme. Let us require here only that sets are *included* among the intelligibles but perhaps do not exhaust them.

Clarification is in order. Note that in including sets among the intelligibles, we are not *using* the notions of set theory in the underlying logic of the theory of emanation. For this latter we are using only the familiar first-order quantification theory with identity. The domain of individuals is taken to consist of all the entities of the four Plotinic realms, including now sets in the intelligible realm. To

specify all this we take  $\epsilon$  for the membership relation and  $\Lambda$  for the null set as primitive. We may then define (D)

D1. "Set  $x$ " as " $(x = \Lambda \vee (\exists y)y \epsilon x)$ ",

and stipulate that

Pr15.  $\vdash (x)(\text{Set } x \supset \text{Int } x)$ .

We also need to specify what the members of sets are to be allowed to be. Clearly the members are to be just the inhabitants of the lowest realm, sets of such, and so on, but not the One nor the AllSoul. If these were allowed membership, we should then be *using* set theory to formulate the Plotinic theory, rather than merely allowing sets their proper place in the intelligible realm. Thus we have as additional principles that

Pr16.  $\vdash \sim (\exists x)\text{One} \epsilon x \cdot \sim (\exists x)\text{AllSoul} \epsilon x \cdot \sim (\exists x)(\text{Int } x \cdot \sim \text{Set } x \cdot (\exists y)x \epsilon y)$ ,

and, more generally, that

Pr17.  $\vdash (x)(y)(x \epsilon y \supset (\text{Set } x \vee \text{Obj } x))$ ,

and hence, of course, that

Pr18.  $\vdash (y)((\text{Set } y \cdot \sim y = \Lambda) \supset (\exists x)(x \epsilon y \cdot (\text{Set } x \vee \text{Obj } x)))$ .

It was remarked that the One and the AllSoul are given primary unity, and that the intelligible realm and the cosmos are multiplicities and have only secondary unity. How then do we handle the individual souls, and the oneness of these realms? To attempt to answer the first question, let us bring in the human body. Let "HB  $x$ " express that  $x$  is a human body. What then is the human person or individual soul? If we allow ourselves the logical devices of the calculus of individuals (Leśniewski's *mereology*)—which we shall surely wish to do at some point—in addition to quantification theory with identity, we may proceed as follows. Let  $(x \cup y)$  be the compound or sum individual consisting of  $x$  and  $y$  together, and let us suppose that we can form the sum of any two entities from the whole Plotinic universe. Also we let " $x$  Ens  $y$ " express that  $x$  ensouls  $y$ , that is, that  $x$  enters into or affects  $y$  in the appropriate manner. We then may identify the living human person or individual soul-cum-body (LPer) as merely the compound entity  $(\text{AllSoul} \cup x)$  where  $x$  is an HB ensouled by the AllSoul. Thus we may define

D2. "LPer  $x$ " as " $(\exists y)(\text{HB } y \cdot x = (\text{AllSoul} \cup y) \cdot \text{AllSoul Ens } y)$ ".

Then clearly we have that

Pr19.  $\vdash (x)(y)(z)((\text{HB } y \cdot x = (\text{AllSoul} \cup y) \cdot \text{AllSoul Ens } y \cdot \text{HB } z \cdot x = (\text{AllSoul} \cup z) \cdot \text{AllSoul Ens } z) \supset y = z)$ ,

and of course, where "P" is the part-whole relation between individuals, that

Pr20.  $\vdash (x)(y)(\text{LPer } x \cdot \text{LPer } y \cdot (\exists z)(\text{HB } z \cdot z \text{ P } x \cdot z \text{ P } y) \supset x = y)$ .

Note that Pr19 and Pr20 are merely logical truths, showing the one-to-one correspondence between living persons and ensouled human bodies. Also clearly

Pr21.  $\vdash (x)(\text{HB } x \supset \text{Obj } x)$ ,

but

Pr22.  $\vdash \sim (\exists x)(\text{HPer } x \cdot \text{Obj } x)$ .

The use of "Ens" here for the relation of ensoulment is a desirable extension of our vocabulary. Plotinus explicitly states, in IV. 3. 9, that "if we are to explain and to be clear, we are obliged to use such words as 'entry' and 'ensoulment,' though never was . . . [the] All unsouled, never did body subsist with soul away, never was there Matter unelaborate; we separate, the better to understand; there is nothing illegitimate in the verbal and mental sundering of things which must in face be co-existent."

Now let us consider the unity of the realm of the intelligibles. This may be taken in terms of the notion of the *fusion* of a class in the sense of the calculus of individuals. Thus we may identify *Nous* with this fusion. More formally, we may let

D3. "*Nous*" abbreviate "Fu'Int".

Where  $i_1, i_2, \dots$  is the nondenumerably infinite array of intelligibles, the entity *Nous* is merely  $(i_1 \cup i_2 \cup \dots)$ . Of course we can never carry out an enumeration of these intelligibles, their cardinality presumably being beyond all bounds even among the transfinite cardinals.

With the notion of *Nous* available as a collective term, so to speak, we may emend Pr11 above. It might appear too strong to say that each and every intelligible individually emanates into the AllSoul. A weaker and perhaps more acceptable statement is that *Nous*, as  $\blacksquare$  whole, does; that is, that the intelligibles *collectively* emanate into the AllSoul. Thus in place of Pr11 we might better require that

Pr11'.  $\vdash \text{Nous Em AllSoul}$ .

Let us try now to justify some of these principles, to some extent at least, on the basis of the actual text.

That there is a multiplicity of ideal forms is discussed at some length in VI.7, and in II.4.4 it is commented that

there must be some character common to all [forms] and equally some peculiar character in each keeping them distinct. This peculiar characteristic, this distinguishing difference, is the individual shape. But if shape, then there is the shaped, that in which the difference is lodged. There is, therefore, a Matter accepting the shape, a permanent substratum. Further, admitting that there is an Intelligible Realm beyond, of which this world is an image, then, since this World-Compound is based on Matter, there must be Matter there too.

The feature common to the forms is no doubt that they are instantiable or inhere in something else. This feature is "there," then as characterizing the entities

in the intelligible realm. Where there is an "individual shape" or character, there also is implicitly that which is shaped or characterized. There is then "intelligible matter" in the ideal realm in just this sense. And note how natural it seems to include sets in the intelligible realm, sets above all having this property of having members—except the null set, which is somewhat adscititious anyway. It is very interesting to note that Plotinus, in II.4.5, comments that "we discover these two—Matter and Idea—by sheer force of our reasoning which distinguishes continually in pursuit of the simplex, the irreducible, working on, until it can go no further, towards the ultimate in the subject of inquiry." The irreducible in any inquiry are the notions characterized in primitive terms in just such and such a way, much as subjects (proper names or variables) and predicates, together, of course, with the basic logical ingredients, are irreducible elements in language systems.

The definition D2 is in close harmony with I.1.3–5. Plotinus states that

we may treat of the Soul as in the body—whether it be set above it or actually within it—since the association of the two constitute the one thing called the living organism, the Animate. . . . Now this Animate might be merely the body as having life: it might be the Couplement of Soul and body: it might be a third and different entity formed from both.

Or, we can add, it might be all three. "The truth lies," Plotinus contends, "in the consideration that the Couplement subsists by virtue of the Soul's presence." Plotinus seems to come out here by saying that whatever we wish to say concerning the Animate, we can say in terms of the ensouled Couplement. A most natural interpretation of these remarks is thus in terms of logical sums, as in D2. Recall also, in I. 7. 3, that "life is a partnership of Soul and body; death is the dissolution; in either life or death, then, the Soul will feel itself at home." The AllSoul is clearly "at home" in both itself and any of its couplements.

That a proper name should be taken for the Soul is amply justified in IV.9, in which it is argued that there is but one Soul, although there is a sense in which we may speak of your soul, my soul, and so on. "We are not asserting the unity of soul in the sense of a complete negation of multiplicity—only of the Supreme can that be affirmed—we are thinking of soul as simultaneously one and many, participant in the nature divided in body, but at the same time a unity by virtue of belonging to that Order that suffers no division. . . . These reflections show that there is nothing strange in that reduction of all souls to one. But it is still necessary to inquire into the *mode* and *conditions* [italics added] of the unity," as well, of course, into the perhaps merely verbal partition of the All-Soul into the celestial and lower souls. This all can be done, however, it would seem, on the basis of the foregoing logical reconstruction, as we shall see in a moment.

Incidentally, the remarkable passage in II.3.13 no doubt gives the key to what remains to be done.

The gist of the whole matter lies in the consideration that Soul governs this All by the plan contained in the Reason-Principle [italics added] and plays in the All

exactly the part of the particular principle which in every living-thing forms the members of the organism and adjusts them to the unity of which they are portions: the entire force of the Soul is represented in the All but, in the parts, Soul is present only in proportion to the degree of essential reality held by each of such partial objects.

How Whiteheadian this sounds, the "degree of essential reality" being akin to the degree of ingression of an eternal object into an actual occasion, and to the extent to which any occasion acts in accord with the vision of it in the primordial nature of God. Should we introduce a numerical measure here? It is tempting to do so, just as it is in the discussion of Whitehead.<sup>1</sup> We might let " $x \text{ Em }^i y$ " be taken primitively to express that  $x$  emanates into  $y$  only to degree  $i$ . A much more elaborate theory would result. However, let us not introduce here complications beyond necessity.

The cosmic plan contained in the Reason-Principle will be discussed in a moment.

In IV.3, Plotinus argues "against those who maintain our souls to be offshoots from the Soul of the universe (parts and not an identity *modally parted* [italics added])." On the contrary, "there is one identical soul, *every separate manifestation being that soul complete* [italics added]." Plotinus is sensitive to divergent meanings of "part," and regards it as false that individual souls are "parts" of the AllSoul in most senses of that word. However, there is one sense that he does seem to allow. There is the sense of "part" in which we speak of a theorem as being a part of the entire science to which it belongs. "The theorem is separate, but the science stands as one undivided thing, the separation into theorems being simply the act of making each constituent notion explicit and efficient: this is partition without severance; each item potentially includes the whole science, which itself remains an unbroken total." How now are we to handle the multiplicity of souls so as to assure that there is only one identical soul, "every separate manifestation being that soul complete?" The key notion here is that the individual souls are only "modally parted" from the AllSoul—*intentionally* so, we might say—but not actually so.

To handle intentionality, let us adopt Frege's notion of the *Art des Gegeben-seins*, or mode or manner of linguistic presentation. Let us consider first the embodied AllSoul as taken under this or that predicate. Let " $F_0$ " be a predicate-description of entities capable of *intellection*, of intuiting entities of the intelligible realm. Let " $G_0$ " be a predicate-description of entities capable of *reasoning* in the ordinary sense, and " $H_0$ " for unreasoning entities (or animals). We can then consider human and animal bodies under these three different predicates, which give, as it were, the three characteristic acts of the lower souls. To provide for the first two, the intellective and reasoning human souls, we form ordered couples of human persons with " $F_0$ " and " $G_0$ ." Thus  $\langle x, F_0 \rangle$  becomes identified with the intellective soul (IntSoul) of person  $x$ , and  $\langle x, G_0 \rangle$  with  $x$ 's reasoning soul (ReasSoul). Thus, in general, we may let

D4a. "IntSoul  $\langle x, "F_0" \rangle$ " abbreviate " $(HPer\ x \cdot "F_0" \cdot "Den\ x")$ ,"

where "Den" stands for the relation of multiple denotation between the one-place predicates of the language and whatever objects that language is concerned with. And similarly

*D4b.* "ReasSoul  $\langle x, "G_0" \rangle$ " for " $(HPer\ x \cdot "G_0" \cdot "Den\ x)$ ".

And similarly for Unreasoning Souls, *mut. mat.* (*D4c*).

Note that the principle of individuation for the multiplicity of intelligible and reasoning souls is the human body, and for the unreasoning souls, the animal body. This would surely seem to accord with Plotinus' intent.

Note the need for the intentional treatment of the lower souls. It might well obtain factually that

$$\vdash (x)(F_0x \equiv \text{Repr } x),$$

for some "Repr" expressing, say, that  $x$  reproduces its kind by sexual union. But we would not wish then to regard  $\langle x, \text{Repr} \rangle$  or  $\langle x, \text{Repr} \rangle$  as an intellective soul. Hence the use of the predicate " $F_0$ " rather than the property (or class)  $F_0$  as the second item in the couple, which use prevents the replacement of " $F_0$ " by its factual equivalent "Repr." And clearly we would not be tempted to replace the name of " $F_0$ " by the name of "Repr," these being very different names.

Now "nothing of Real Being is ever annulled." There is no "bodily partition" among the intelligibles, "no passing of each separate phase into a distinct unity; every such phase remains in full possession of that identical being. It is exactly so with the souls." Recall that definitions *D4a* to *D4c* make of "bodily partition" the principle of individuation for the separate souls. Even so, each separate soul remains in "full possession" of the AllSoul. Note also that, although the whole human person is regarded here as capable of intellection and reasoning, it is only the person *under the given predicate-description* that is regarded as a soul. In this way an intentional multiplicity of individual souls is achieved, so to speak, but with the unity of the AllSoul preserved. All of the lower souls involve, in a suitable way, the whole of the AllSoul, as we see from the definitions. There is thus no actual partition of the AllSoul into a multiplicity, only a modal or intentional one.

No doubt we should distinguish here between embodied and unembodied souls. *D4a* to *D4c* are concerned, of course, with embodied souls, and it is they to which the predicates " $F_0$ ," " $G_0$ ," and " $H_0$ " are regarded as applicable. Analogous definitions could be given taking the AllSoul itself under these descriptions. There would then be just three such unembodied souls. The multiplicity can be achieved, however, by taking " $F_0$ ," " $G_0$ ," and " $H_0$ " more narrowly as descriptive of just the intellective, rational, and unrational capacities and/or activities of the various individual souls. We would then have as many " $F_0$ "s as intellective souls. Let " $F_{\frac{a}{n}}$ " be the intellective predicate for the AllSoul as ensouling human person  $a$ , " $F_{\frac{b}{n}}$ " for the AllSoul as ensouling human person  $b$ , and so on. Then

*D5a.* 'UnIntSoul  $\langle \text{AllSoul}, EF_{\frac{a}{n}} \rangle$ ' may abbreviate ' $(HPer\ a \cdot EF_{\frac{a}{n}}\ Den\ a)$ '

where ' $EF_{\frac{a}{n}}$ ' is the structural description of the predicate ' $F_{\frac{a}{n}}$ '. And similarly for the other two, *mut. mat.* (*D5b–D5c*). According to these definitions, it is, of

course, the AllSoul that performs intellection or reasoning through or by means of a human person, so to speak.

In this way, then, "the world of unembodied souls" is provided, as well as those "in our world" that "have entered body and undergone bodily division" (IV.1.1). Recall that "soul, there without distinction or partition, has yet a nature lending itself to divisional existence; its division is secession, entry into body." Also "the secession is not of the Soul entire; something of it holds its ground, that in it which recoils from separate existence." Thus, although AllSoul occurs essentially in the expansions into primitive terms of the *definientia* of *D4a–D4c*, it is only certain very special "phases" of AllSoul that are considered, not all phases, not all properties ascribable to it. "Thus it is that, entering this realm, it [the AllSoul] possesses still the vision inherent to that superior phase in virtue of which it unchangingly maintains its integral nature. Even here [in the world] it is not exclusively the partible soul: it is still the impartible as well: what in it knows partition is parted without partibility; undivided as giving itself to the entire body, a whole to a whole, it is divided as being effective in every part"—of the body, we should add, as well as being effective in every part of every body.

Again, in IV.2.1., it is noted very explicitly that

the bodies are separate and the Ideal-Form [AllSoul] which enters into them is correspondingly sundered while, still, it is present as one whole in each of its severed parts, since amid that multiplicity in which complete individuality has entailed complete partition, there is a permanent identity; . . . In whatsoever bodies it occupies—even the vastest of all, that in which the entire universe is included—it gives itself to the whole without abdicating its unity. . . . Itself devoid of mass, it is present to all mass: it exists here [in distinct phases (?)] and yet is there, and this [there] not in distinct phases but with unsundered identity: thus it is "parted and not parted," or, better, it has never known partition, never become a parted thing, but remains a self-gathered integral, and is "parted among bodies" merely in the sense that bodies, in virtue of their own sundered existence, cannot receive it unless in some partitive mode: the partition, in other words, is an occurrence in body, not in soul.

Enough discussion now—perhaps too much—on the AllSoul and its various phases or partitions, but not yet enough about its role as the Demiourgos and the Cosmic Plan. How are we to handle this latter? Clearly the AllSoul *orders* every object and every intelligible whether that object partakes of that intelligible or not. The Soul governs the All by the plan contained in the Reason-Principle, as was noted in II.3.13. And in IV.3.13, we are told that "The Ineluctable, the Cosmic Law, is . . . rooted in a natural principle under which each several entity is overruled to go, duly and in order, towards that place and Kind to which it characteristically tends, that is, towards the image of its primal choice and constitution." Are we to regard the Plan, then, as including items provided by metaphysical principles such as *Pr1–Pr22*, and so on, or are we to think of it as having to do only with the objects of the lower cosmos? The former (*Pr1–Pr22*) are already provided for and stipulate the way the world is, where "world" is taken in the widest possible sense. And one of the ways the world is, of course, is that the AllSoul plans how "each several entity," including the lower souls, goes "duly and in order to that place and Kind" to which it properly belongs. Thus the Plan

seems to have to do primarily with the lower Cosmos, and with the intelligibles only in their relevance, so to speak, to the lower Cosmos. The AllSoul "looks towards its higher and has intellection; towards itself, and orders, administers, governs its lower" (IV.8.3).

The Plan here, incidentally, has some affinity with the primordial valuations constituting Whitehead's primordial nature of God. These are fixed once and for all and concern each and every actual occasion with respect to the ingression in it of each and every eternal object.

Let "Order" be a new primitive for the dyadic relation of ordering in just the sense that the AllSoul is to be regarded as ordering the lower cosmos. Syntactically speaking, the AllSoul orders that such-and-such sentences obtain. Some of these sentences are to the effect that

$$x \in y,$$

where  $x$  is an object and  $y$  is a set of objects. Others of these sentences concern the lower souls, which in the foregoing treatment are regarded as entities taken under a given linguistic description or *Art des Gegebenseins*. Thus the theory concerning Order will be in the *metametalinguage* of that in which sentences concerning the lower souls occur. This is harmless enough, merely a fact to be noted.

A word more is in order concerning the syntactical structure of the sentences concerning the lower souls. Because we are not using set theory here as part of the basic logic of the entire scheme, the ordered couples used for handling the lower souls are merely *virtual*. The notation for them is thus wholly eliminable in favor of a primitive notation in which no ordered couples are values for variables.<sup>4</sup> And the bringing in of an *Art des Gegebenseins* carries us into the metalanguage, enabling us to speak of the AllSoul in its various modal or intentional phases. Expressions for the lower souls are thus significant only contextually; more specifically, in contexts in which the AllSoul (in its entirety, so to speak) is taken under different linguistic descriptions. Any sentence (in primitive terms) of this kind let us call an *LS-statement*, a statement ascribing to or denying something or other of the lower souls. Similarly let us call *Obj-statements* sentences of the form

$$'x \in y'$$

where  $x$  is a constant for an object and  $y$  for a set. (Note the legitimacy here of using set theory in speaking about *objects*.) Now the Plan is concerned in part surely with LS- and Obj-statements, as we shall see in a moment.

As metametalinguistic principles concerning the Plan, we have then the following:

$$Pr23. \vdash (x)(a)(x \text{ Order } a \supset (x = \text{AllSoul} \cdot \text{Sent } a))$$

and

$$Pr24. \vdash (a)(\text{AllSoul Order } a \supset \text{Tr } a),$$

where " $\text{Tr } a$ " expresses that  $a$  is a truth of the metalanguage. *Pr23* here is a *Limitation Principle*, according to which only the AllSoul orders anything, and

whatever it orders is a sentence of the metalanguage. *Pr24*, a *Principle of Cosmic Obedience*, we might call it, is to the effect that whatever is ordered is true. We may assume also a *Completeness Principle*, that the AllSoul orders all logical consequences (LogConseq) of what it orders.

$$Pr25. \vdash (a)(b)((\text{AllSoul Order } a \cdot b \text{ LogConseq } a) \supset \text{AllSoul Order } b).$$

Having built set theory into the lower cosmos, we need to allow the AllSoul to provide for its axioms, and no doubt for basic scientific law also. Let " $\text{SetAx } a$ " express that  $a$  is an axiom of the set theory assumed, and " $\text{ScL } a$ " that  $a$  is an acceptable scientific law. Then also a *Principle of Scientific Law* obtains:

$$Pr26. \vdash (a)((\text{SetAx } a \vee \text{ScL } a) \supset \text{AllSoul Order } a).$$

Provision must also be made for laws governing intelligibles that are not sets. Let " $\text{IntL } a$ " express that  $a$  is such a law. Then also a *Principle of the Intelligible Realm* obtains:

$$Pr27. \vdash (a)(\text{IntL } a \supset \text{AllSoul Order } a).$$

That this principle is needed is evident from IV.3.13, where it is said that "even the Intellectual-Principle, which is before all the Cosmos, has it also, its destiny, that of abiding intact above, and of giving downwards; what it sends down is the particular whose existence is implied in the law (or decreed system) of the universal."

Finally, surely, the AllSoul orders all (factually) true LS- and Obj-statements.

$$Pr28. \vdash (a)((\text{LSSent } a \vee \text{ObjSent } a) \cdot \text{Tr } a) \supset \text{AllSoul Order } a).$$

This is the *Principle of Factuality*.

Note that *Pr24* provides only that truth is a necessary condition, not a sufficient one, for what is ordered. The preceding principles *Pr1-Pr22* (or rather their translations within the metalanguage) are themselves true but not ordered. Note also that all of the principles, including the Plan principles *Pr23-Pr28*, are timeless, all being stated in what Frege called the "tense of timelessness." Time, space, and the like, being relevant only for objects of the lower cosmos, are provided in what is ordered, not in the ordering, so to speak.

Another point is perhaps worth making. In taking an entity under a linguistic description, we can, of course, allow for equivalent descriptions in various ways: in terms of *L-equivalence*, in terms of some suitably defined notion of *synonymy*, or in terms of the linguists' relations of *paraphrase* or *translation*. An entity taken under any paraphrastic description is just as good, like a rose by any other name. This point would be scarcely worth the making were it not so frequently misunderstood.

The multiplicity, but not the unity, of the lower cosmos has been commented on. How can we handle the unity? Merely as the fusion of the realm of objects. Thus

$$D6. \text{ "LCosmos" is short for "Fu'Obj".}$$

This definition is of course analogous to D3, above of "Nous," and makes use of Leśniewski's mereology just as that definition does.

It should be recalled from II.3.13, that the "Soul governs this All by the plan contained in the Reason-Principle [italics added]." Reasoning has to do with statements—or propositions if you like—whereas intellection has to do only with the pure apprehension of the intelligibles. Intellection is thus not propositional, whereas reasoning is. The Plan is thus given by the AllSoul in its capacity for reasoning, and is stated in terms of statements. It is only statements that are ordered. Of course, reasoning presumably presupposes intellection of that which is reasoned about, just as statements must contain in an essential way names or other expressions for the intelligibles.

A further remark or two now about the One. "That awesome Prior, The Unity, is not a being [in the sense of being an intelligible, the AllSoul, or any object of the lower cosmos] . . . : strictly, no name is apt to it, but *since name it we must* [italics added] there is a certain rough fitness in designating it as unity [or "One" as above] with the understanding that it is not the unity of some other thing" (VI.9.5.). Without a name for it, any systematic discourse concerning it would presumably be impossible. We could not even state our metaphysical scheme. And although Pr14—that very few interesting properties can be ascribed to the One—does proceed by a kind of *via negativa*, still there is much to say concerning the One as the ultimate source of emanation and as the object of aspiration "There"—for "There only is our veritable love and There we may unite with it, not holding it in some fleshly embrace but possessing it in all its verity" (VI.9.9).

In all talk of the return to the One, "the flight of the alone to the alone," the converse of the relation Em ("Em" is no doubt the fundamental one. Consider Pr6–Pr10, rewritten now in terms of "Em." These indicate that everything other than the One bears Em to it—no second thing does—and thus every intelligible does, the AllSoul does, and every object does. We can read "E" as "aspires to the condition of," "desires to return to the purity of," or the like. Note that by Pr11', the AllSoul bears Em to Nous; by Pr12, every object bears Em to the AllSoul; and by Pr13, nothing bears Em to any object. All this seems as it should be. Note the analogue of Pr11' here rather than that of Pr11. Rather than to say that the AllSoul bears Em to each intelligible, we require only that the AllSoul bears Em to Nous itself, that is, to the intelligibles taken collectively, to the Divine Mind. The appropriateness of this gives support to using Pr11' in place of Pr11. . . . Of course there is much more to be said about the return to the One, the flight of the alone to the Alone, but essential in all such discourse, it would seem, is the relation Em.

It was suggested above that it might be of interest to introduce a numerical degree for emanation, so that " $x \text{ Em}' y$ " would express that  $x$  emanates to  $y$  to just the degree  $i$ . (" $y \text{ Em}' x$ " would then express that  $y$  aspires to  $x$  to just degree  $i$ .) The same may be said for the relation Ens for ensoulment. The need for this may be seen as follows. In IV.4.36 we are told explicitly that "we cannot think of the world as a soulless habitation, however vast and varied, a thing of materials easily

read off, kind by kind—wood and stone and whatever else there may be, all blending into a cosmos: [on the contrary,] it must be alert throughout, every member living by its own life." Plotinus allows "grades of living within the whole, grades to some of which we deny life only because they are not perceptibly self-moved; in truth, all of these have a hidden life; and the thing whose life is patent to sense is made up of things which do not live to sense, but, nonetheless, confer upon their resultant wonderful powers towards living."

To provide for this "hidden life," let " $x \text{ Ens}' y$ " express that  $x$  ensouls  $y$  to just the degree  $i$ . If  $i = 1$ , there is total ensoulment. But we would presumably have as a principle that every object is ensouled by AllSoul to a degree, however small, greater than 0:

Pr29.  $\vdash (x)(\text{Obj } x \supset (\exists i)(i > 0 \cdot \text{AllSoul Ens}' x))$ .

We can then rephrase D2, the definition of "LPer" for living persons, in such a way as to require the ensoulment to be high. If a body is ensouled to a high degree, then and only then is it living. But even dead bodies are ensouled to some very small degree. Pr29 is, thus, a kind of *Principle of Panpsychism*.

A few final comments. The foregoing contains a sketch of the barest beginnings of the Plotinic system. Additional primitives, of course, are needed, many further principles, much further elaboration. Only the barest logical maquette, so to speak, has been given here. Enough has been shown, however, it is hoped, to enable us to see that the system could be further developed in such a way as to throw more and more light on the full logic of the All-Soul and of the accompanying metaphysical theory. Further, this can be done in such a way, as here, as to bring it into harmony with contemporary scientific theory, both in mathematics and in the empirical sciences. There should be no fundamental conflict, it is contended, between the great Plotinic vision and modern science. But the latter should not be disregarded in our attempt to understand the former. Hence the presence here of set theory and of scientific law as having their proper roles in the entire system.

Also it is interesting that in the delineation of the lower souls, an intentional kind of metalogic is needed, and that in the delineation of the Plan, the semantical truth concept. Without these resources, including of course quantification theory, it is unthinkable that the liaison here could take place. Perhaps this is the reason no one has attempted it heretofore—apparently the resources were simply not available. In any case, it is hoped that the foregoing helps to show the usefulness of modern logic as a tool of philosophical analysis. Logic should not be seen only as a subject apart, a *logica docens*, having to do just with abstract metamathematical structures, but also as a *logica utens*, helping out not only in the clarification of philosophical problems, but in the analysis of the great historical texts as well.

# Some Logical Aspects of the Concept of Hypostasis in Plotinus

JOHN P. ANTON

## I

Recent studies on the philosophy of Plotinus have drawn attention to the complex problems interpreters face when discussing the number of *hypostases*,<sup>1</sup> or what the term means in the case of the One, the *Nous*, and the Soul. The full exploration of these broad topics, especially in the light of Plotinus' theory of "production" and his critique of the alternative views other Neoplatonists held, falls outside the scope of this paper. Since Plotinus' answer to the question "What criteria must X satisfy to qualify as a *hypostasis*?" is given in the relevant texts,<sup>2</sup> and as such may be treated as a separate issue, the present paper assumes familiarity with the related doctrines in order to consider in some detail certain logical aspects of the One qua hypostasis.

Source: Reprinted from *The Review of Metaphysics* 31:2 (December, 1977), pp. 258–271. Reprinted by permission. Originally presented at the Second International Congress of the International Society for Neoplatonic Studies, Brock University, October 23, 1976; and in revised version at the joint session of the Society for the Study of the History of Philosophy with the American Philosophical Association, Pacific Division, Portland, Oregon, March 25, 1977.

Plotinus believes that it is impossible that contradictory statements are forthcoming when we speak correctly about the One. Though the One is beyond οὐσία (ἐπέκεινα τῆς οὐσίας) and thus beyond predication, it is still the case that he makes it the object of discourse. The thesis that contradictions are not possible when we speak of Being or of that which truly is, is common to both Plato and Aristotle. In the realm of higher dialectic, only true statements are possible, and *epistēmē*, as a system of true statements, is free of contradictions. This thesis is fundamental to all classical ontology.

Given that according to Plotinus we can discourse about the One and that we must learn how to speak "correctly" when referring to the One, the issue is to decide whether his own discourse on the One qua hypostasis is tainted with even seemingly contradictory statements. Thus what is needed is to examine the logical status of certain statements on hypostasis as it pertains to the One. The issue has been raised by John N. Deck in his book on Plotinus.<sup>3</sup> Though he has ably defended Plotinus against the charge of contradiction, the solution he offers casts a doubt on whether the One can be said to be or have hypostasis in the fullest sense. It will be shown, however, that his solution is misleading and unwarranted. The textual evidence does not support it.

## II

Deck writes:

The One or Good, was demonstrated by the need of *Nous* for a principle and a good. The *Nous* is other than the Good; the caused is other than the cause. The One is thus a distinct hypostasis, a distinct "nature."<sup>4</sup>

In a long footnote (fn. 5) on the same page, Deck notes that "hypostasis" "is not for Plotinus himself a common designation of the One." This may be so, but it matters little how common the designation is or how frequently the term occurs in the text. The important thing is that Plotinus uses it in significant ways and that he frequently employs the verbal form ὑπόσταται and its derivative expressions to discuss fundamental aspects of the One as well as *Nous* and Soul. The discussion which follows is restricted solely to the One qua hypostasis.

Deck admits that he has been able "to find only one place where he [Plotinus] calls the One in so many words "the first hypostasis," and cites *Enneads* VI.8.15.30, where the expression ὑπόστασις δὲ πρώτη occurs, and then proceeds to give a list of the following related passages:

- (i) VI.6.3.11: the One as "having hypostasis."
- (ii) VI.8.13.43–44: "the hypostasis of the Good."
- (iii) VI.8.7.47: "its quasi-hypostasis" (οἷον ὑπόστασις αὐτοῦ).

What Deck says in the rest of this important footnote is worth quoting in full.

It would seem that the designation of the One as an hypostasis in systematic accounts of Plotinus' philosophy is based on the title of VI. 1, which treatise is an elementary outline of the doctrine of the One, the *Nous* and the Soul: "About the Three Hypos-

theses Which Are Principles (περὶ τῶν τριῶν ἀρχικῶν ὑποστάσεων). This title, however, like all the titles of Plotinus' treatises, is not Plotinus' own (Porphyry, ch. 4, lines 16–18). In speaking of the One, the Nous and the Soul in this treatise, Plotinus calls them "these three" (V.1.10.5) or "the three natures" (V.1.8.27).

Several critical observations and reservations are in order:

1. The passage V.1.10.5, regarding the expression "these three," has no direct bearing on Deck's point. The text reads: "Ὡς περὶ δὲ ἐν τῇ φύσει τριττὰ ταυτὰ ἔστι τὰ εἰρημένα. οὕτω χρὴ νομίζειν καὶ παρ' ἡμῖν ταῦτα εἶναι. The expression "these three" is used in a collective sense and refers in the text to (a) the One beyond being, ἐπέκεινα τοῦ ὄντος ἐν . . . , (b) Nous, νοῦς . . . , (c) the nature of the Soul, τῆς ψυχῆς φύσις.

2. The expression "the three natures," ταῖς φύσεσι ταῖς τρισίν, is made with reference to Plato's *Parmenides* in order to show agreement on these three natures. Therefore, we must not take it for granted that "natures," as used here, is part of Plotinus' stock terminology, nor are we allowed to infer that "nature" is used synonymously with "hypostases." Furthermore, there is no reason to insist that what the passage says may serve as evidence for or against the thesis that the One is a hypostasis. Just the same, Deck holds that "nature can mean hypostasis."<sup>5</sup>

3. Deck goes beyond the question of whether this passage supports an interpretation which permits us to count the One among "the three hypostases." Thus he proceeds to dismiss "systematic accounts of Plotinus' philosophy" that favor this view and even has reservations about appealing to words used in Porphyry's titles. However, Deck offers no decisive argument to show that Porphyry had taken liberties when editing the master's works.<sup>6</sup>

Deck admits that he has been able to find only one place (VI.8.15.30) where Plotinus "calls the One in so many words 'the first hypostasis.'" However, he does not consider this passage decisive enough to concede, as we shall see, that the One is one of the primary hypostases; rather, as he argues, its status is no more and no less than that of a "quasi-hypostasis." But before we examine the grounds for his thesis, we must first take a careful look at what Plotinus says in the passage to which Deck refers the reader in order to decide its relevance to Deck's initial point that Plotinus is in fact identifying on this sole occasion the One and the first hypostasis rather than presupposing it. The real question is whether Plotinus is discussing the point which Deck claims. When line 30 is read in context, we obtain a different picture. First we need to note that *Enneads* VI. 8, deals with the topic "On Free Will and the Will of the One." Now, the text where line 30 comes reads:

Ἐπόστασις δὲ πρώτη οὐκ ἐν ἀψύχῳ οὐδ' ἐν ζωῇ ἀλόγῳ 30  
ἀσθενὴς γὰρ εἰς τὸ εἶναι καὶ αὐτὴ σκέδασις οὕσα λόγῳ  
καὶ ἀοριστία· ἀλλ' ὅσω πρόεισιν εἰς λόγον, ἀπολείπει  
τύχην τὸ γὰρ κατὰ λόγον οὐ τύχη.

Translation:

Moreover, the first hypostasis cannot consist of something inanimate or of life irrational; for such a life [or state] is weak in respect of being, and itself a scattering

of reason and indetermination. However, to the extent that it advances toward reason, it abandons chance; for what is in accordance with reason, is not subject to chance.

Strictly speaking, line 30 in this passage does not say what the first hypostasis is; it presupposes reference to the One. Taken in isolation, as we shall see, its meaning becomes ambiguous. To illustrate this point we need to go back to the opening lines of chapter 15, especially 4–10, where the term "hypostasis" occurs in a way that fixes the context for what lines 30–34 mean to convey.

Εἰ δὲ τὸ συνὸν τῷ ᾧ σύνεστιν ἐν καὶ τὸ οἶον ἐπιέμενον τῷ ἐφετῷ 5  
ἐν, τὸ δὲ ἐφετὸν κατὰ τὴν ὑπόστασιν καὶ οἶον ὑποκεί-  
μενον, πάλιν αὖ ἡμῖν ἀνεφάνη ταῦτό ἢ ἐφεις καὶ ἢ  
οὐσία. Εἰ δὲ τοῦτο, πάλιν αὖ αὐτὸς ἐστὶν οὗτος ὁ ποιῶν  
ἑαυτὸν καὶ κύριος ἑαυτοῦ καὶ οὐχ ὥς τι ἕτερον ἠθέλησε  
γενόμενος, ἀλλ' ὥς θέλει οὗτος. 10

MacKenna's translation, itself not free from misinterpretations, reads as follows:

Since in the Supreme "associated" and "associating" are one, seeker and sought one, the sought serving as Hypostasis and substrate of the seeker—once more God's being and his seeking are identical; once more, then, the Supreme is the self-producing, sovran of Himself, not coming to be as some extern willed but existing as wills it.<sup>7</sup>

It is important to see why MacKenna's translation is misleading. Plotinus' argument takes the form: "If so and so is the case, on the basis of what the interrelated terms a and b, and c and d, mean with reference to the One, then it should be clear that certain identities follow." The theorem, so to speak, he is about to prove in this chapter is that love (*eros*) and the beloved (*erasmion*) are identical in the One as love of itself. Thus, if the copresent, the *synon*, and that in which it is copresent (*tō en ὃ synestin*) are one, and if the desiring and the desired (*ephiemenon tō ephetō*) are one, in which case the desired is in the fashion of hypostasis and as though *hypokeimenon*, then it becomes clear to us that desire (*ephestis*) and *ousia* are identical. The context in which the argument occurs makes it evident that Plotinus is not purporting to prove here that the One is a hypostasis; rather, his point is that the concept of hypostasis can help us understand how it is that the One is the ideal case of self-love. The argument starts with distinctions and comparisons in order to collapse the meanings of the terms involved, with the assistance of the mode of hypostasis. If so, it is not correct to say that "hypostasis" here is a substitute for the One, which is what MacKenna's translation "serving as Hypostasis" implies.

The passage to which Deck appeals comes only twenty lines later, 3 f., where the expression "first hypostasis" occurs. However, the word "first," in order to support his claim, should have normally come in line 6, where the collapsing of the correlative terms is defended. Instead, Plotinus avoided using it there, and for good reasons. In lines 30 and following, we suddenly have a new unit of thought which contains a negative particle, to tell us in what things the first hypostasis is not to be sought: inanimate things and irrational life. Nothing explicit is said about

what this first hypostasis is as such. Are we then to suppose that it is to be found in something animate and in instances of rational life? No such conclusion follows. Yet its nature remains unidentified, and the passage ends on advice as to how to ascend to that which is not just logos but more beautiful (*kallion*) than logos.

But now we have a new question: What is that which is more beautiful than logos? The answer to this is suggested in what the next sentence says: whatever qualifies as the root of reason (*rizā tou logou*), which is of itself and that in which everything terminates (*eis touto ta panta lēgei*). Unless the reader is already familiar with the preceding chapters, it is difficult to decide whether the "root" means the One or *Nous*. Either can meet this requirement in certain ways, though not both of the word "everything" or "all" is taken in the most inclusive and absolute sense, which would then include *Nous* itself. Without these qualifications, *Nous* can conceivably be regarded as the "first hypostasis." Strictly speaking, Plotinus offers no unequivocal answer in these lines of the passage under consideration, and that is why it is misleading to quote out of context, thus forcing the passage to say what it does not. Instead of a direct answer, Plotinus resorts to a simile: this "root of reason" is "like the principle and ground of a greatest plant, living according to logos, while the principle itself remaining by itself, giving the being which the plant received according to logos" (translation supplied). The text reads:

Ῥίζα γὰρ λόγου παρ' αὐτῆς καὶ εἰς 35  
τοῦτο λήγει τὰ πάντα, ὥσπερ φυτοῦ μεγίστου κατὰ λόγον  
ζῶντος ἀρχὴ καὶ βάσις μένουσα αὐτὴ ἐφ' ἑαυτῆς.  
διδοῦσα δὲ κατὰ λόγον τῷ φυτῷ, ὃν ἔλαβεν, εἶναι.

As chapter 15 draws to a close, the issue remains unsettled. The question which still lingers in the reader's mind is not whether Plotinus intends to identify the One as the first hypostasis, but whether the argument is one which aims to establish this identity. This is so because the main emphasis is on what is *eros* and what self-love means in the ultimate sense of the word. Probably Plotinus could have settled the issue and dispensed with the ambiguity if instead of the expression "root of reason" he said "root of *Nous*." The difficulty can no doubt be removed by borrowing freely from the texts, but it would be a different solution. Hence, if the One is the first hypostasis, which it is, we must look for further textual evidence. Had Deck made use of the difficulty in lines 30–38, he probably could have made a stronger case for his "quasihypostasis" thesis. However, since he considers chapter 18 to have provided a clear statement for what the first hypostasis is, he finds it necessary to seek the countervailing evidence elsewhere.

### III

In discussing Plotinus' tactic in philosophizing about the One, Deck observes, and correctly so, that Plotinus employs "dualistic phrases, but usually to correct them, usually to remind his hearers that these phrases must be purged of dualism to apply to the One" (p. 10). Deck also draws attention to Plotinus' awareness of

"speaking incorrectly" (οὐκ ὀρθῶς) in VI.8.13–18, and of resorting to "words which must depart from the rigor of knowledge (παρανοητέον ἐν τοῖς λόγοις)" (VI.8.13.1–5; 47–50).

Thus, according to Deck, such "incorrect speaking" of the One occurs in a number of cases, which are reproduced below.

- (i) The One is from itself, from itself and through itself: παρ' αὐτοῦ, VI.8.14.42; ἐφ' αὐτοῦ, VI.8.11.33.
- (ii) It is towards itself: πρὸς αὐτὸν καὶ ἐξ αὐτόν, VI.8.17.26; πρὸς αὐτό, V.3.10.51.
- (iii) It wills itself, VI.8.13.38–40.
- (iv) It makes or constitutes itself as cause of itself: αἰτιον ἑαυτοῦ, VI.8.14.42.
- (v) It made itself to subsist: αὐτὸς ἄρα ὑπέστησεν αὐτόν, VI.8.16.30.
- (vi) It is self-sufficient (qua good): ἑαυτῷ 1.8.2.4–5.

Of these six select instances of "incorrect speaking," so named on the ground that the expressions are dual and hence misleading, the crucial one for the purposes of this paper is (v): "it made itself to subsist."

Since the One needs nothing (I.8.2.4–5; VI.9.6.18), Deck argues that:

It does not need subsistence, entity, act or life. If it needed any of these it would not be the first: some other principle, toward which it tended, would supply them to it (cf. III.8.11.38–44). Nor does it *have* them. For in having them, it would be two: itself, and that which it had. Neither needing nor having them, but the source from which they proceed, the One is beyond subsistence, beyond entity, beyond act (pp. 10–11).

Now we come to another crucial expression in Plotinus, in Deck's list:

- (vii) The One is before subsistence: πρὸ τῆς ὑποστάσεως, VI.8.10.37.

Hence:

- (vii) The One does not subsist: οὐδὲ ὑπέστη, VI.8.10.35–38; τὸ μὴ ὑποστάν, VI.8.11.1–5.

Of course, Deck is careful to note that "Plotinus is not contradicting himself. The One is or has all these [viz., substance, entity, act, life, self-sufficiency], to the extent that neither they nor the being or having of them involves duality" (p. 11).

The real issue for Deck is not so much whether Plotinus is contradicting himself, but whether the One is a hypostasis, and if so how are we to understand it qua hypostasis. He absolves Plotinus of the charge of contradiction by saying that "Plotinus applies negative formulae to the One, not to deny positivity of it, but to deny duality." And he continues, further down, to say:

Thus positive formulae can be applied to the One, provided that they be qualified to remove the taint of duality: the One has *quasi*-subsistence, *quasi*-entity, *quasi*-life, which are identical with itself (p. 11).

Deck cites VI.8.7.46–54 and renders Plotinus' expression οἷον ὑπόστασις αὐτοῦ as "quasi-subsistence." Now, it may be objected that the charge of contradiction need not be raised at all, notwithstanding Deck's defense against it; nor is it

correct, as will be shown, to attribute to Plotinus a doctrine of "quasi-subsistence." In pursuing his analysis, Deck is (a) inventing an issue which is cast in the form of a rhetorical question: "Does Plotinus contradict himself?" and (b) dismissing the issue by forcing an interpretation which the text does not justify, namely that the meaning of "hypostasis" in the case of the One is that of "quasi-subsistence." Contrary to Deck's view, the text requires that the term "subsistence" be kept intact, and that it means "hypostasis par excellence." This meaning can be best understood in the context of αὐτεξούσιον "in control of itself."

**A. The "quasi-subsistence" problem: οἷον ὑπόστασις.** The passage to which Deck appeals comes immediately after Plotinus has stated that it would be most absurd to take away "self-control" from the Good, for it neither needs anything nor moves towards any of the things which move towards it, and he continues in lines 46–54:

"Ὅταν δὲ  
δὴ ἡ οἷον ὑπόστασις αὐτοῦ ἡ οἷον ἐνέργεια ἢ (οὐ γὰρ ἡ  
μὲν ἕτερον, ἡ δ' ἕτερόν ἐστιν, εἴ γε μὴδὲ ἐπὶ τοῦ νοῦ  
τοῦτο) οὐτὶ μᾶλλον κατὰ τὸ εἶναι ἢ ἐνέργεια ἢ κατὰ, τὴν  
ἐνέργειαν τὸ εἶναι ὥστε οὐκ ἔχει τὸ ὡς πέφυκεν ἐνεργεῖν, 50  
οὐδὲ ἡ ἐνέργεια καὶ ἡ οἷον ζωὴ ἀνενεχθήσεται εἰς τὴν  
οἷον οὐσίαν, ἀλλ' ἡ οἷον οὐσία συνοῦσα καὶ οἷον συγγε-  
νομένη ἐξ αἰδίου τῇ ἐνεργείᾳ ἐξ ἀμφοῖν αὐτὸ αὐτὸ ποιεῖ  
καὶ ἑαυτοῦ καὶ οὐδενός.

Translation:

When the hypostasis of the Good, such as this can be,<sup>12</sup> is regarded as actuality (for these are not two different things, not even in the case of Nous), it is no more the case that actuality is determined by being than being is by actuality. Therefore, "to act," as originated by nature, does not apply here, nor can actuality and what is like (its) life be reduced to what is like (its) *ousia*; rather, *ousia*, such as it may be in this case, as copresent and as being born together with actuality since eternity, is what the Good makes itself from itself and nothing else.

If the above rendition is close to Plotinus' meaning, then "hypostasis" in the case of the One-Good must be used in the fullest sense of the term. Hence, it seems rather baffling to call it "quasi-hypostasis." The text makes it clear that Plotinus means to correlate the concepts of "hypostasis" and "*energeia*" with the help of "being," "*ousia*," and "life." The words συνοῦσα, συγγενομένη, and ἀμφοῖν support this view. If so, the "incorrect way of speaking" has been cleared of its difficulties by the time Plotinus has ended each chapter.

**B. The issue of contradiction.** We need now to turn to those passages in which Plotinus is allegedly denying hypostasis of the One. The difficulty begins to emerge when we try to understand the sense in which the One is "before subsistence" (πρὸ τῆς ὑποστάσεως) and such that "it made itself to subsist" (αὐτὸς ἄρα ὑπέστησεν αὐτόν). Let us consider the text. The expression πρὸ τῆς

ὑποστάσεως occurs in VI.8.10.37. The main question which chapter 10 raises in this connection is whether "chance" can have any place in a philosophical account of the One qua *archē*. Thus, Plotinus asks:

Τὴν δὴ ἀρχὴν παντὸς λόγου τε καὶ τάξεως  
καὶ ὅρου τῶς ἂν τις τὴν τούτου ὑπόστασιν ἀναφείη τύχη;

Translation:

When we ask about that which is the origin of every logos and order and limit, how can one ascribe its hypostasis to chance?

The answer is that we cannot. Now, since the One is also the *first*, we must stop there and say nothing more. We may inquire into the things generated from it, but not into the origins of that which is truly ungenerated. At this point Plotinus finds it necessary to raise a question about the meaning which the expression "to give hypostasis to X" can have in the case of the One. In this connection, Deck is right when he says that Plotinus must remove from his exposition of the One "the taint of duality." Thus, Plotinus needs to correlate two things: (a) what it means *to give hypostasis* and (b) what it is *to be ungenerated*. It is the former that presents a problem of possible duality. What he concludes in lines 22–38, in complicated "question and answer" language, is that the One is at once ungenerated and by necessity, that is, "using itself such as it is." "Being master of its own *ousia*," nothing made the One subsist. The One gave itself its own subsistence and necessarily so. The expression οὐχ ὑποστήσας ἑαυτόν appears to contradict the expression πρὸ τῆς ὑποστάσεως only because the text is complicated. The misunderstanding can be removed without much difficulty with the aid of two recommendations: the first is editorial, the second calling for careful contextual reading.

### (1) Textual emendation.

Lines 22–25 must be read as a series of *three interconnected questions*, and not as a simple passage consisting of one question ending on the word *kurios* (l. 23), and the rest as a quasi-question in the *hypothesis-apodosis* syntactical mode. Seen in this way, the intent of the passage can be more faithfully rendered, and thus the expression οὐχ ὑποστήσας ἑαυτόν falls in line with the thesis which pervades the entire tractate. By placing a question mark rather than a period at the end of line 25, the passage would translate:

But then, can we say that, if the One is ungenerated and while being such as it is, that is not master of its own *ousia*? And can we say that, if not master of it, while being such as it is, that it *did not cause itself to subsist* (οὐχ ὑποστήσας ἑαυτόν) by using itself such as it is, and that this is so by necessity and could not be otherwise?

### (2) Contextual reading.

Given that the One is master of its own *ousia*, it is inherently necessary that it be conceived as causing itself to be its own subsistence. Ten lines later, after he has

explained why the One has "fullness of power" (ὑπερβολὴν τῆς δυνάμεως) and it is thus impossible for it to "arrive at what is worse" (ἐλθεῖν πρὸς τὸ χεῖρον), he returns to the issue of hypostasis. The context of these lines permits us to see what Plotinus means by the expression οὐδε ὑπέστη.

Since the aspect of necessity (ἀνάγκη) had already been discussed in previous chapters of VI.8., where it was established that the necessity of the One is different from other necessities, it makes no sense in the present context of chapter 10 to say that there is such a thing as a necessity and also the One, as if this is a real duality. Since the One is not subject to necessity but rather is itself the ground of all other necessities, of being and law, the question, rhetorical to be sure, is "How could one, then, say that it is necessity which causes the One's subsisting (ὑπέστησεν), especially if the One is understood as having fullness of power?"

Obviously, Plotinus must insist that this is not the way to talk about the One qua hypostasis, for it is not the case that it is thus that it came to subsist (ὑπέστη); nor can it be that it is *this necessity* that afforded subsistence to the other subsistents (ὑποστάντων) that came after it and because of it. Given that the One has no source other than itself for its hypostasis, such as it may be, it is evident that *qua* One, it is prior to all cases of subsistence. Now the concluding question, which already contains the answer, becomes: "How can it then be that what is admittedly prior to hypostasis, attains subsistence (ὑπέστη) by virtue of something else, unless it did so by itself?" Therefore the place of the subject of the verb ὑφιστάναι cannot be occupied by the word "necessity."

Since the One is the only thing that is (i) πρὸ τῆς ὑποστάσεως and (ii) the ὑποστήσας εαυτόν, it is also the only thing which is at once (iii) a hypostasis underived from another hypostasis. These considerations set the context for the opening question of chapter 11: Ἀλλὰ τὸ μὴ ὑποστάν τοῦτο τι; "But what is this One which is 'not subsisting'?" The dialectical discussion which follows holds no surprise for the reader. Logically enough, Plotinus returns to the aspect of subsistence to restate that the One "attained its own subsistence from itself before any other" (ἐφ' αὐτοῦ γὰρ καὶ ὑφέστηκε, πρὶν ἄλλο).

#### IV

The preceding analysis was not directed against a position Deck obviously does not hold, namely that Plotinus is in fact open to the charge of contradiction. Rather, the purpose was to show that the issue of contradiction does not even arise in any significant way, not even as a preliminary difficulty. However, there is one residual problem in Deck's interpretation, namely his contention that, in the case of the One, we can only speak of its being a "quasi-hypostasis." This, as has been argued, is a mistaken interpretation. In addition to what has been said in the discussion of the relevant texts, further support may be adduced from VI.8.13, lines 50–52 and 55–59, where Plotinus clearly speaks of the Good in connection with an argument to show that it is possible to bring will and being together (συνακτέον εἰς ἓν τὴν βούλησιν καὶ τὴν οὐσίαν).

Εἰ γὰρ ἡ βούλησις 55  
παρ' αὐτοῦ καὶ οἷον ἔργον αὐτοῦ. αὐτὴ δὲ ταῦτόν τῃ  
ὑποστάσει αὐτοῦ, αὐτὸς ἂν οὕτως ὑποστήσας ἂν εἴη  
αὐτόν· ὥστε οὐχ ὅπερ ἔτυχεν ἔστιν, ἀλλ' ὅπερ ἡβουλήθη  
αὐτός.

Translation:

For if will is from Him and like His work, while His will is identical with his hypostasis. He himself can thus come to subsist (οὕτως ὑποστήσας) as is possible for Him. Therefore, this did not occur by chance but precisely as He willed.

There is no reason, therefore, to call this a quasi-hypostasis. In fact, it seems evident that Plotinus has anticipated such reservations as Deck has expressed. If we were to ask what a quasi-hypostasis would amount to, most certainly it would have to be one which is not deserving of the One, for it would be lacking in something. One could conceive of no stronger instance than the case of hypostasis which is lacking in *energeia*. Quite likely Deck would resist this imputation on his view, but let us consider the case. Plotinus would most definitely reject it as inadmissible and disown it outright on the basis of what he states in VI.8.20, lines 11–15:

Εἰ δὲ ὑπόστασιν ἄνευ ἐνεργείας τις  
θεῖτο, ἐλλειπὴς ἢ ἀρχὴ καὶ ἀτελής ἢ τελειοτάτη πασῶν  
ἔσται. Καὶ εἰ προσθεῖη ἐνέργειαν, οὐχ ἓν τηρεῖ. Εἰ οὖν  
τελειότερον ἢ ἐνέργεια τῆς οὐσίας, τελειότατον δὲ τὸ  
πρῶτον, πρῶτον ἂν ἐνέργεια εἴη. 15

Translation:

If one posits hypostasis without *energeia*, the *Archē*, which is the most perfect of all principles, would be incomplete and imperfect. And if one would make *energeia* something composite, then he could not preserve the One. Thus, if *energeia* is more perfect than *ousia*, and that which is first is most perfect, it must be that *energeia* is the first.

The argument leads to the fundamental thesis that hypostasis calls for more than the mere addition of *energeia*. What makes the concept of hypostasis intelligible and actual is the original activity of the One, which is presupposed by its *ousia*. Given these ontic restrictions, it is difficult to see how we can speak of a "quasi-hypostasis" in the case of the One. In fact, it cannot be other than the *first hypostasis*. This is what "correct discourse" about the One demands.

# *The One, or God, Is Not Properly "Hypostasis":*

## *A Reply to Professor John P. Anton*

JOHN N. DECK

As someone who essays to be a contemporary Christian Neoplatonist, I have been very much alive to the perennial problem of the articulation of the "negative theology" of the One with the more positive indications of the divine nature to be found in the Judaeo-Christian tradition.

Meanwhile, to be sure, the "negative theology" itself requires careful and continuous consideration because Plotinus also allows himself, in a way, to predicate something of the One.

When, then, someone is found to argue that the One is, for Plotinus, literally and without correctives a "hypostasis," the "first hypostasis," there is involved first of all a simple problem in Plotinian interpretation; but beyond that, the philosophico-theological question of what can and cannot be said of the First, the Source, God—what can and cannot be said, and *how* it can be said or not said.

Professor John P. Anton's paper, "Some Logical Aspects of the Concept of Hypostasis in Plotinus,"<sup>1</sup> adopts precisely these positions. And it is devoted almost exclusively to a criticism of certain remarks I had made in *Nature, Contemplation and the One* (NCO)<sup>2</sup> concerning the appropriateness (or inappropriateness) of des-

ignating the Plotinian One an "hypostasis." In replying to it I will expose Plotinus' doctrine again, and also, by implication at least, indicate what I as a philosopher think *cannot* be said of the One, or of God.

Professor Anton correctly discerns that I interpreted Plotinus as *not* taking the One to be hypostasis in an unqualified sense, but his route to this intuition is a somewhat surprising one: He picks up his indications from a rather bland footnote and a few phrases used some pages beyond it. He treats these materials as though they were a fully articulated argument, with odd results.

The "bland footnote" (NCO, p. 19, n. 5) in question was to annotate the mention of the One in the text of NCO as "a distinct hypostasis, a distinct 'nature.'" I had remarked only that "Hypostasis is not, for Plotinus himself, a common designation of the One." Professor Anton does not deny this (Anton, p. 25. I had said that I had "been able to find only one place where Plotinus calls the One, in so many words, the 'first hypostasis.'" The place was *Ennead* VI.8.30.

*Parturiunt montes.* In a discussion stretching over four pages (Anton, pp. 26–30), replete with phrases like "Deck's initial point," "whether Plotinus is discussing the point which Deck claims," "the passage to which Deck appeals," and so on, Anton argues, in brief, that the mention of "the first hypostasis" in this text must be taken in the context of a rather long section to see that it is indeed the One which is so designated. If a person did not read rather far back and rather far ahead, he might take "the first hypostasis" to refer to something else. But according to Anton, "the first hypostasis" here *does* refer to the One. So?

But meanwhile, Professor Anton seems to have guessed that if I *had* written an *exprofesso* tractate on "The Plotinian One—A Hypostasis?" I would have tried to make much of Plotinus' phrases "before hypostasis?" (πρὸ τῆς ὑποστάσεως) and "quasi-hypostasis" (ὅλον ὑπόστασις)—but he does not understand *why* I would have done so. Possibly because of his concentration on a footnote, he fails to see, in the few pages of NCO (pp. 9–11) to which we are both referring, the outline of a full-scale argument which shows why the One absolutely cannot be, for Plotinus, without qualifications a hypostasis. This argument is contained in these pages and, in fact, displayed in their visible structure.

I wish to take this opportunity to present that argument before making further replies to Professor Anton's critique.

At the beginning of my systematized presentation of Plotinus' One—talk, I had written:

Plotinus is at once in difficulty when he begins to describe the One. He sees that for him the One must be ineffable. Even the name "One," if taken as a positive designation, is not suitable (V.5.6.28–30). To add a predicate to the One, or even to say that it *is*, would be to make it two—"One" and "is"—and therefore, [make] the "one which is" the second nature and not the first.

Not I wish to make it clear that I regarded, and do regard, this as Plotinus' most profound doctrine of the One. It is to be taken as absolutely definitive—as

absolutely qualifying *any* statements he may make elsewhere which predicate *anything* of the One, with or without cautions or qualifying words or phrases. In short, I am saying that *he means it*—if he means anything. My insistence on this is perhaps affected by my own philosophic adhesion to it, as also by the “logical precedence” that it obviously must enjoy when it is taken in full seriousness. *Strictly speaking, the One is absolutely without predicates.*<sup>3</sup>

I went on to show that for Plotinus even “the Good”—which, indeed, he uses often enough as a virtual synonym for the One—is not, strictly speaking, a proper designation. It is the good for the others, but it is *not good for itself*—“good for itself” involves a duality.

This led to another point. The One is in no way whatever dual. Hence any predicate that displays or implies duality would be doubly wrong in its application to the One. Wrong because it is a predicate and wrong because it is in itself dual. For example, the One wills itself, that is, the One is a (or the) self-willer.<sup>4</sup>

Nevertheless, Plotinus uses the dualistic words. He “must” use them. As I put it in *NCO*:

And yet the very simplicity of the first principle can be expressed, unless we are merely to repeat endlessly “the One,” only by words and phrases which in themselves connote duality. Plotinus is fully aware of this. His tactic is to employ the dualistic phrases, but usually to correct them, usually to remind his hearers that these phrases must be purged of dualism to apply to the One.

A little further on I mentioned several of these phrases, which Plotinus himself uses in the long passage (VI.8.13–18) where he cautions us at the outset that he is speaking incorrectly (οὐκ ὁρθῶς): from itself and through itself, wills itself, makes or constitutes (ποιεῖ) itself. These are dualistic phrases, they would give the One two “sides” or two aspects (e.g., the maker and the made).

Writing now, I would go even further and at least suggest that *any* phrase taken, as it must be taken, from the world of being (which, we will recall, is for Plotinus dualistic through-and-through, the world of Knower-Known or, as some like to say, Intelligence-Intelligible)—*any* word or phrase, with the possible exception of “the One”—is at least implicitly dual.

What about “hypostasis”? I think it should at any rate be examined for internal duality, which in all probability will show up. It is dual at least in its primitive meaning, “a standing-under.” That which in its own nature “stands-under” requires, as its dialectic partner, that under which it stands. This two-sided meaning does seem sometimes to be Plotinus’, meaning notably in a text from which both Professor Anton and I quote (VI.8.20) (see page 38). But whether this duality and/or other dualities are involved in other cases where Plotinus uses the word is a large and unexplored question.

Now since *no* predicate, taken as it is from the realm of being, can, for these two reasons, be applied in an utterly proper sense to the One, the application of *any* predicate must be qualified by a denial. This situation naturally results when one applies the language of being to that which is above being.<sup>5</sup> Thus in *NCO* (p.

11) I lined up texts in which Plotinus (a) affirms and (b) denies the subsistence, act, freedom, and life of the One. I proceeded:

Plotinus is not contradicting himself. The One is or has all these, to the extent that neither they nor the being or having of them involves duality. When Plotinus denies an attribute of the One he does so to affirm the simplicity of the One; when he affirms an attribute he shows that the One, though simple, is not negative.

Out of this, Anton gets no more than “Deck is inventing an issue which is cast in the form of a rhetorical question: ‘Does Plotinus contradict himself?’” (Anton, p. 30), and then devotes two-and-one-half pages (pp.31–33 to “the issue of contradiction.”

I suggest that the contradictory formulas cited would raise the question of contradiction in almost anyone’s mind, when it is operating on a certain level. But, in point of fact, I was neither inventing this “issue” nor making much of it. I moved at once to something much more vital: *how* Plotinus uses the negative formulas, *how* he uses the positive. I was guided here again by the realization that (a) *neither* type is quite right, and (b) that he “must” use both.

And again, in the knowledge that Plotinus cannot properly predicate *anything* of the One, I was attracted in *NCO* (p. 11) to a text in which he apparently qualifies several predications, among them hypostasis. This text is VI.8.7.49–54. Professor Anton objects to my translation of οἷον in this text by *quasi*, and offers his own translation:

When the hypostasis of the Good, *such as this can be*, is regarded as actuality (for these are not two different things, not even in the case of *Nous*), it is no more the case that actuality is determined by being than being is by actuality. Therefore, “to act,” as originated by nature, does not apply here, nor can actuality and what is *like* (its) life be reduced to what is *like* (its) *ousia*; rather, *ousia*, *such as it may be in this case*, as copresent and as being born together with actuality since eternity, is what the Good makes itself from itself and nothing else (Anton, p. 30).

I have italicized the words he uses to translate οἷον (and to avoid saying “quasi”). Now I submit that even his translation could easily be read as meaning quasi-hypostasis, and so on. I can see that he is trying to attach another shade of meaning to “such as this can be,” “such as may be in this case,” but it is far from clear what that shade may be. “Like” seems awfully like “quasi.” I do not wish to labor this argument: Anton’s new translation simply has not made his point.

At the very end of his article, Professor Anton returns to the “quasi-hypostasis” question. He seems to have no notion of why I “pounced” on the expression οἷον ὑπόστασις in the first place:

If we were to ask what a quasi-hypostasis would amount to, most certainly it would have to be one which is not deserving of the One, for it would be lacking in something (Anton, p. 33).

Why? Why should quasi-hypostasis be taken “most certainly” as necessarily less than hypostasis? Why not as *more than hypostasis*? Even a cursory reading of

NCO should have conveyed this meaning. On page 11 I had closely connected the phrase *πρὸ τῆς ὑποστάσεως* before hypostasis with the characteristic Plotinian doctrine (derived from Plato) that the One is beyond; is the sense of *above*; *ousia*: *ἐπέκεινα τῆς οὐσίας*. The One is before, prior to, above hypostasis and for this reason is called quasi-hypostasis.

But in pursuing the ill-conceived notion that a quasi-hypostasis is lacking in something, Professor Anton considers the case: maybe it is lacking in *energeia* (act). Then he finds a text in which the word "hypostasis" occurs, and which says that the One is act (or rather, that act is the first). This is used for a triumphant vindication of the One as the "first hypostasis."

Now in the text in question Plotinus is saying that the One and its producing of itself are the same. The preferred word for this seems here to be the Aristotelian "*energeia*," and it would be interesting to dilate, both textually and philosophically, on the appropriateness and inappropriateness of calling the One "*energeia*," or of substituting "*energeia*" for "One."

Professor Anton, however, does not see this, nor does he notice that the to-him-obnoxious phrase *ὁλον ὑπόστασις* occurs again in the line just above the first line he quotes. In fuller rendition:

We must not fear to posit the first act without entity, but we must posit this itself [the first act] as a quasi-hypostasis. If we were to posit a hypostasis without act, the *Arché* would be lacking and the most perfect of all would be imperfect. And if we added act, we would not preserve the One. Now if act is more perfect than entity, and the first is the most perfect, the first will be act (VI.8.20.9–15, trans. Deck).

The notion here seems to be that the One is a self-subsistent act. The nuance of "quasi-hypostasis" is slightly different here, but the meaning comes through again that the quasi-hypostasis being spoken of is "more than" hypostasis: The act (which is the One) is a *quasi* hypostasis because it does not have a subject or substratum in which it inheres, but is, as it were, its own subject or substratum—or, better yet, "gets by" without a substratum.

As I remarked above, Professor Anton leaves out the first sentence. So, with reference to this very text, he says "it is difficult to see how we can speak of a quasi-hypostasis in the case of the One." The text itself, when read with the first sentence, makes it impossible *not* to speak of the act-which-is-the-One as quasi-hypostasis.

If I may be permitted to mention what I think is just under the surface in Professor Anton's article, I would say that he is attempting to impose a logic on Plotinus that is not Plotinus' own and which is not philosophically productive. Hypostasis is not a "big word" for Plotinus,<sup>6</sup> "the One" is. But hypostasis *is* a big word—an important "concept"—for Professor Anton, and in this sense it is no accident that he called his paper "Some Logical Aspects of the Concept of Hypostasis."

But does he find a logic of hypostasis in our philosopher? In note 2 (p. 158), Prof. Anton proposes to refer us to "key passages" in the *Enneads* which give "the basic features of hypostasis." For "infinite and nonspatial," he cites VI.3.8. 35ff.

The doctrine is not there at all; hypostasis is not mentioned; the text contrasts sensible with true *ousia* but not in terms of infinite-finite or spatial-nonspatial. The other text he cites in this connection (VI.9.6.10–12) contains the often-discussed doctrine that the One is infinite in power. The text (and the whole context) concerns the One; hypostasis is not mentioned. For "undiminished giving," he cites texts that display the *Nous* (III.8.8.46–48) and the One (III.8.10.1–19) as "undiminished givers." For "the One qua hypostasis [italics Anton's] transcends knowledge altogether," he cites VI.7.39.19–33. "Hypostasis" does not occur either in the texts or the contexts, and so forth.

He is simply taking texts about the One, the *Nous*, and Soul or souls, and, because he is certain that hypostasis is an overarching concept applied to the One, *Nous*, and Soul, giving it out that these texts are "Plotinus' answer to the question 'What criteria must X satisfy to qualify as a hypostasis?'" (Anton, p. 24). *Plotinus has neither the question nor the answer.*

Thus, if an interpreter's question may be allowed to arise, "Is the One an hypostasis?" the answer is to be found, not in the "logical aspects of the concept to hypostasis," not, that is, in the logic of hypostasis, but in the "logic," so to speak, of the One. Indeed, any "concept" (better, any entity) has its proper home at the level of *Nous*. It must be adjusted downward to "apply" below the level of *Nous*, and adjusted upward to "apply" to the One. And this is what seems to happen with hypostasis. The hypostasis, in the fullest sense, is the *Nous*. The inferior hypostasis, Soul, is less-as-a-hypostasis. The One is above hypostasis and is best described, when the word "hypostasis" is used at all, as quasi-hypostasis.

# Plotinus' Theory of The One

EUGENE F. BALES

## I

The purpose of this essay is to offer an interpretation of Plotinus' doctrine of The One or The Good, which is more adequate than the traditional interpretation and which, at the same time, indicates a fundamental difficulty with Plotinus' theory. For the purpose in mind, I have elected to concentrate only on the chronologically middle treatises of the *Enneads*. These treatises constitute not only the numerical bulk of that larger work, but also its most philosophically sophisticated part, if we can trust the judgment of Porphyry.<sup>1</sup>

Traditionally most commentators have distinguished ■ positive and a negative theology within Plotinus' doctrine of The One.<sup>2</sup> That is, Plotinus speaks on occasion as though The One radically transcends Being, is devoid of intelligible content, and so forth; and, on other occasions, as though The One is the highest Being, has an intelligible, if minimal, content, and so forth. The former is designated negative theology, the latter positive theology.

That this interpretation sheds light on Plotinus' theory is beyond question; but the contention here is that this interpretation is not entirely adequate. Specifically,

I wish to propose the existence of three modes of discourse that Plotinus uses in discussing The One or The Good: (1) The first mode of discourse is employed when he speaks of The One as though it transcends Being, Mind, Freedom, Will, Consciousness, and Form, and is thus void of all Act and intelligible content. This mode of discourse I shall refer to as *meontological* (from *mē ōn*, nonbeing). (2) The second mode of discourse is employed when Plotinus speaks of The Good as though it is within Being rather than beyond it, the essence of Act, containing all things potentially, as having some kind of Consciousness, Will, Mind, and as being the Transcendental Self. This mode of discourse I shall designate *ontological*. (3) The third mode of discourse is used to show the relationship between the first two modes of discourse. This occurs when The One is spoken of as a Formless Form, as everywhere and nowhere, as all things and nothing, as Being and Non-Being, and preeminently as Self-caused. This mode of discourse I will refer to as the *paradoxical*.

It is my contention, first of all, that this third mode of discourse is an essential addition to the first two, and that without the third, no sense can be made of the relation between the first two. But secondly, it is my belief that insuperable problems concerning the intelligibility of Plotinus' theory of The One arise precisely because of this third mode of discourse.

## II

There are many passages in the middle treatises that assert The One's transcendent relation to Being. The following is typical:

It follows that The First must be without form, and, if without form, then it is no Being; Being must have some definition and therefore be limited; but the First cannot be thought of as having definition and limit, for thus it would be not the Source but the particular item indicated by the definition assigned. . . . Not included among them, this can be described only as transcending them; but they are Being and the Beings; it therefore transcends Being.

Note that the phrase "transcending Being" assigns no character, makes no assertion, allots no name, carries only the denial of particular being.<sup>3</sup>

This ultimate beyond Being in Plotinus' system is said to be beyond multiplicity, and thus to be Pure Unity, that is, a unity which, neither directly nor indirectly, has any parts:

It was necessary that The First be utterly without multiplicity, for otherwise it must be again referred to a prior.<sup>4</sup>

A Pure Unity that has no duality in it, that is, no parts, has no content whatever either potentially or actually; thus one could say that it is a void:

. . . containing, then, neither the good nor the not-good it contains nothing and, containing nothing, it is alone: it is void of all but itself.<sup>5</sup>

This characteristic vacuity of The One is further emphasized in that Activity cannot be predicated of it at all:

That all-transcending cannot have had an activity by which to produce this activity—acting before act existed—or have had thought in order to produce thinking—applying thought before thought exists—all intellection, even of the Good, is beneath it.<sup>6</sup>

The lack of Activity in The One implies its lack of power or “metaphysical abundance”:

Who has begotten such a child, this Intellectual-Principle, this lovely abundance so abundantly endowed?

The source of all this cannot be an Intellect; nor can it be an abundant power: it must have been before Intellect and abundance were; these are later and things of lack; abundance had to be made abundant and Intellection needed to know.<sup>7</sup>

The very perfection of The One is rooted in its lack of power, of act, of content.<sup>8</sup>

At one point this sheer vacuity of The One *seems* to have led Plotinus to the extreme of ruling out its power to cause. If The One is pure Non-Being, of course, it is quite unintelligible to propose that it *causes* Being. Any particular thing would derive its finite being from Being, and not from Unity. This is, I believe, the gist of the following rather odd passage:

The single thing derives its unity by participation in Unity-Absolute; its being it derives from Being-Absolute, which in turn hold [sic] its Being from itself and its unity from Unity-Absolute.<sup>9</sup>

Although Plotinus usually asserts that Unity is the *source* of Being,<sup>10</sup> he seems here to be saying that Being is its own source. The implication is that the One is the cause of the unity in Being, but not of Being itself. There is no reason to think, however, that this was Plotinus' ordinary view of the matter; indeed there are no other passages in the *Enneads* that I know of that suggest such a theory.

If The One transcends Being, it transcends both subject and object:

Anyone making the Good at once Thinker and Thought identifies it with Being and with the Intellection vested in Being so that it must stand as self-intellective: at once it becomes necessary to find another principle, one superior to that Good.<sup>11</sup>

The denial of Objectivity and Subjectivity within The One occupies much of Plotinus' attention. There are any number of passages, for example, that deny that The Good is, in fact, an Idea or Form:

The Authentic Beauty, or rather the Beyond-Beauty, cannot be under measure and therefore cannot have admitted shape or be Idea: the primal Beauty, the First, must be without Form: the beauty of that higher realm must be, simply, the Nature of the Good.<sup>12</sup>

Thus it is the unshaped that gives shape; the formless that gives form. Further, if the Good is not a Form, it is not a particular good, nor even the highest good, since both of these are forms:

... surely the First must be able to say “I possess Being”?  
But he does not possess Being.

Then, at least he must say “I am good”??

No: once more, that would be an affirmation of Being.

But surely he may affirm merely the goodness, adding nothing: the goodness would be taken without the being and all duality avoided?

No: such self-awareness as good must inevitably carry the affirmation “I am the Good.”<sup>13</sup>

Thus, The Good is not good; rather as Non-Being it is beyond genera, and thus beyond the kinds or degrees of goodness. Goodness, even the highest goodness, is intrinsically intertwined with Being: to be good is to be something definite. Thus, metaphysically, The Good is not a Form of any kind.

While The Good is not an object of Thought, it is not a subject of some kind either. In the first place, Plotinus insists quite often that it has no intellection:

There must have been something standing consummate independently of an intellectual act, something perfect in its own essence: thus that in which this completion is inherent must exist before intellection; in other words it has no need of intellection, having been always self-sufficing: this, then, will have no intellectual act.

Thus we arrive at: a principle having no intellection, a principle having intellection primarily, a principle having it secondarily.<sup>14</sup>

Intellection, of course, demands a duality of some kind between knower and known; thus Pure Unity can never be a principle having intellection, since it stands apart from any duality.

In the same vein, Plotinus stipulates further that the One is beyond freedom, “higher than all will, will a thing beneath it.”<sup>15</sup>

For This is principle of all, or, more strictly, unrelated to all and, in this consideration, cannot be made to possess such latens as even freedom and self-disposal, which in fact indicate manifestation upon the extern.<sup>16</sup>

### III

There are some very significant passages in which the *Being*, rather than the Non-Being, of The Good is stressed by Plotinus.

The first example is the most striking: it occurs in VI. 5 (“On the Integral Omnipresence of the Authentic Existent [II]”):

Hence the Good is not to be sought outside: it could not have fallen outside of what is; it cannot possibly be found in non-Being; within Being the Good must lie, since it is never a non-Being.

If that Good has Being and is within the realm of Being, then it is present, self-contained, in everything: we, therefore, are not separated from Being; we are in it; nor is Being separated from us: therefore all beings are one.<sup>17</sup>

Here the meontological character of the One is explicitly denied; the Good must lie “within Being.” The very end of this quotation, I believe, throws some light on the meaning of this: Being is the ultimate because the final goal of the spiritual

life—the unity of Being—is *in* Being and not *beyond* Being. The ontological character of this statement is unquestionable and directly conflicts with other accounts of The One as beyond Being.

A second example occurs in the treatise "On Free Will and the Will of The One" (VI. 8):

Again; if He preeminently is because He holds firmly, so to speak, towards Himself, looking towards Himself, so that what we must call his being is this self-looking, He must again, since the word is inevitable, make Himself.<sup>12</sup>

Here The One is said to be preeminent, that is, to be the highest Being; and this Being (the infinitive *einai* is used here) is a kind of self-looking. What is significant here is the use of the verb "to be" in this description of The One, a verb that Plotinus is more often than not at pains to avoid using with reference to The One.

Even more indicative than the use of the verb "to be" in reference to The One is the assertion of its active character. The following passage is striking in this respect:

Let no one suspect us of asserting that the first Activity is without Essence; on the contrary the Activity is the very reality. To suppose a reality without activity would be to make the Principle of all principles deficient: the supremely complete becomes incomplete. To make the Activity something superadded to the Essence is to shatter the unity. If then Activity is a more perfect thing than Essence and the First is all perfect, then the Activity is the First.<sup>13</sup>

The very essence of The One is said to be *energeia*, and this *energeia* is tied in with Being, as is evident in another passage from the same treatise as the preceding quote:

The Being accompanies the Act in an eternal association: from the two (Being and Act) it forms itself into The Good, self-springing and unspringing.<sup>14</sup>

Besides the term "*energeia*," the term "*dynamis*" is also used quite often in reference to The One:

The Good is the older—not in time but by degree of reality—and it has the higher and earlier power, all power in fact, for the sequent holds only a power subordinate and delegated of which the prior remains sovereign.<sup>15</sup>

Power here, whether in the sense of *energeia* or *dynamis*, is to my mind a clear ontological characterization: it would be quite out of character to speak of Non-Being as having *dynamis* or *energeia*. Indeed there is a discussion of the ontological character of *dynamis* in VI.1, a treatise concerned with the categories within *Nous*, which confirms this. The passage in question occurs casually in the midst of a highly abstract discussion of Aristotle's category of Quality: Plotinus says that "power or a particular power may be regarded as Substance."<sup>16</sup> Now Plotinus is not talking about The One, and for that reason I would not want to press this passage too far; but if the *dynamis* in the realm of Being, whether general or particular (*tis*), is said to be Substance (*ousia*), would not the use of it in regard to The One have the same connotation as well? Does not the power of The One suggest the

Being of The One? Surely Plotinus does not want us to believe that *dynamis* predicated of The One has nothing in common with *dynamis* predicated of the lower Hypostases. For then how could *dynamis* in the former sense have any meaning at all?

In any case, The One, as the source of all, is thereby the potentiality of all:

And what will such a Principle essentially be?

The potentiality of the Universe: the potentiality whose non existence would mean the non-existence of all the Universe and even of the Intellectual-Principle which is the primal Life and all Life.<sup>17</sup>

This potentiality is the power (*dynamis*) of Being of all things: without the Being of The One, nothing else could exist. Being itself is caused by the Being of The One. In this sense, The One is potentially all things, and thus is not a sheer void at all. This may account for Plotinus' unusual assertion in VI. 8 that The One has a content: "What then is there is of his content that is not Himself, what that is not his Act, what not his work?"<sup>18</sup> The word "content" does not occur in the Greek, but the repetition of *ti* ("what") suggests the same thing: The One can be characterized by various predicates, by *particular* kinds of notions, such as *energeia* or *ergon*.

If The One is understood by Plotinus as Being, it would not be surprising if it is also said to be like the Intellectual-Principle. Several passages in VI. 8 reflect this tendency to understand The One in the image of *Nous*:

As self-dwelling Act and in some sense Intellectual-Principle, the most to be loved, He has given Himself existence.<sup>19</sup>

What is present in Intellectual-Principle is present, though in a far transcendent mode, in the One . . . but Intellectual-Principle, the diffused and image light, is not different in kind from its prior.<sup>20</sup>

The close relationship established here between *Nous* and the One allows Plotinus to suggest other ways of talking about the One as well. Thus, the One can be said to be Form in some sense:

We must admit in the case of Authentic and primary Intellectual-Principle that it is good; thus it becomes clear that every Idea is good and informed by the Good.<sup>21</sup>

The action of The Good upon the Ideas is that of forming them into good Ideas; or, to say the same thing, the Ideas participate in the Form of The Good. This, I believe, is also the point of the following passage:

Unity is due to the presence of Unity; duality to that of Duality; it is precisely as things are white by Whiteness, just by Justice, beautiful by Beauty.<sup>22</sup>

The meaning of this is that beings participate in unity in the same way that white things participate in the form of Whiteness. Thus The One is by analogy a Form.

Similarly, The One is the Supreme Subject, or Self:

It is the First, the Authentic, immune from chance, from blind effect and happening: God is cause of Himself; for Himself and of Himself He is what He is, the first self, transcendently The Self.<sup>23</sup>

Passages like this have given rise to speculation that Plotinus was under Oriental, specifically Hindu, influence. Whatever be the truth of that allegation, we have seen that it would not be unnatural for Plotinus to have arrived at this position anyway, given his ambivalence in characterizing The One as Being or Non-Being. For if the One is Being, it could be understood with equal justice as the Supreme Form or Object, or the Supreme Self or Subject.

This admission of the Selfhood of The One makes sense of some other characterizations. For example, The One as Self is said to have "knowledge" in some sense of the word: "it can have only an immediate intuition self-directed."<sup>30</sup> Indeed, its self-knowledge is real enough that Plotinus can refer to The One in VI.8 as "intellect-in-Unity" as opposed to the duality of Intellectual-Principle itself (*Nous*):

In the same way we are to take Intellectual-Principle and Being. This combined power springs from the Supreme, an outflow and as it were development from That and remaining dependent upon that Intellective nature, showing forth that, so to speak, Intellect-in-Unity which is not Intellectual-Principle since it is no duality.<sup>31</sup>

This is an extraordinary passage in the *Enneads*; at the very least it negates many other statements that The One is quite beyond intellection.

The Selfhood of The One also allows for the assertion of the Presence of Will within The One:

If, then, we are to allow Activities in the Supreme and make them depend upon will—and certainly Act cannot There be will-less—and these Activities are to be the very essence, then will and essence in the Supreme must be identical. This admitted, as He willed to be so He is.<sup>32</sup>

Plotinus devotes the entirety of VI.8 to prove that Will can be meaningfully predicated of The One, indeed that it *must* be. There could be no more solid evidence that he was willing to make positive ontological characterizations of The One.

#### IV

The third mode of discourse is that which characterizes The One in terms of both Being and Non-Being. One notion in particular that stresses the paradoxical nature of this reality is that of self-causation. That which transcends Being participates in the character of Being inasmuch as it possesses the capacity to cause. This capacity to cause is most obviously relevant in explaining why there is Being or *Nous* at all: for The One is said to cause Being. But if Being needs to be explained, and if The One has certain features within it that are also clearly ontological, then why does not The One need to be explained itself? Strictly speaking, The One cannot be explained in terms of another more ultimate reality—since Plotinus does not admit such. But another kind of explanation did suggest itself to him: that of self-causation. In self-causation, two elements must be distinguished: that which causes and that which is caused. A dilemma arises about this theory,

which Plotinus deals with explicitly in VI.8.20. The dilemma can be stated as follows: either that which causes exists or it does not, either it is Being or it is Non-Being. If it is Being, then it does not cause its own existence, since its existence is already presupposed. If it is Non-Being, it could not confer being on itself, since there would be no "it" to confer anything. Plotinus formulates the problem this way:

The difficulty will be raised that God would seem to have existed before thus coming into existence; if He makes Himself, then in regard to the self which He makes, He is not yet in being and as maker He exists before this Himself thus made.<sup>33</sup>

Plotinus' solution is not entirely clear. At first he *seems* to take the position that actually in The One there is only that which causes, not that which is caused. Thus The One is sheer Activity, and

there is no question of "existing before coming into existence"; then He acted He was not in some state that could be described as "before existing." He was already existent entirely.<sup>34</sup>

If this is the case, though, why speak of self-causation at all? Would it not be more appropriate to simply maintain that The One is, and that self-causation is meaningless in explaining the One, since The One cannot be explained? But this alternative would make The One a matter of chance or "happening-to-be"—a characterization that Plotinus rules out over and over again.

As a matter of fact, the above solution—of eliminating that which is caused in The One—is not Plotinus' final word. For he continues to speak of that which is caused by The One:

Now assuredly an Activity not subjected to Essence is utterly free; God's self-hood, then, is of his own Act. If his being has to be ensured by something else, He is no longer the self-existent First: if it be true to say that He is his own container, then He inducts Himself, since from the beginning He caused the being of all that by nature He contains.<sup>35</sup>

Plotinus' *ultimate* solution, then, is not to deny the presence of that which is caused, but to insist on the strict identity of Cause and Caused: "his self-making is to be understood as simultaneous with Himself; the being is one and the same with the making."<sup>36</sup> Now if they *are* strictly identified, then one cannot speak of self-causation, since self-causation presupposes just such a distinction. The real solution, which Plotinus awkwardly sidesteps, is to admit the impossibility of the notion of self-causation. The attempt to combine Being and Non-Being into the unified concept of self-causation produces as a consequence an insoluble dilemma. Yet while self-causation is entirely self-contradictory and paradoxical, Plotinus does not feel obliged in the least to avoid such a conclusion.

The third mode of discourse, then, postulates that that which transcends Being is also the cause of its own Being. The notion of self-causation is the self-contradictory heart of the paradoxical unification of the Being and Non-Being of The One itself. But this whole problem arises once again, *mutatis mutandum*, in

describing the causal relation that exists between The One and *Nous* or Being, the Second Hypostasis. The question of whether The One can cause itself is analogous, if not identical, with whether it can cause Being in its actuality, that is, specifically *Nous*. There are numerous passages that insist that The One is the cause of all beings, of which the following is typical:

... philosophy must guard against attaching to the Supreme what is later and lower: moving above all that order, it is the cause and source of all these, and is none of them.

For, once more, the nature of the Good is not such as to make it all things or a thing among all.<sup>37</sup>

Plotinus insists that we must not predicate of The One that which is properly predicated only of what is lower than The One. Yet he does just that when he adds that The One is the *cause* of all beings. For The Good is said to contain nothing in itself, and yet to be the cause of all; but to be the cause of all is certainly to be something as against nothing at all.

If The One is said to be the source or cause of Being, it is equally the source or cause of freedom,<sup>38</sup> and more especially of form:

Life, then, as it looked towards That was undetermined; having looked it had determination though That had none. Life looks to unity and is determined by it, taking bound, limit, form. But this form is in the shaped, the shaper had none.<sup>39</sup>

Although Being derives its Form from The One, The One is quite formless: this leads to the paradox, occasionally expressed by Plotinus, that that Ultimate is a Formless Form.<sup>40</sup>

Another form of paradox is the admission that The One is both all things and none of them:

It can be none of existing things; yet it is all: none, in that beings are later; all, as the wellspring from which they flow.<sup>41</sup>

Notice the way here in which The One is said to be all things—not in a strict pantheistic sense, but rather as the cause of all things. That latter phrase preserves the transcendence of The One under the cloak of the ontological predicate “cause.” In any case, the point is clear: The One “partakes” of Being (in the sense of being the cause) as well as Non-Being (beyond Being).

There is another passage which, in a more literary and less technical way, suggests the paradoxical nature of The One:

It is certainly thus that the Intellectual-Principle, hiding itself from all the outer, withdrawing to the inmost, seeing nothing, must have its vision—not of some other light in some other thing but of the light within itself, unmingled, pure, suddenly gleaming before it; so that we are left wondering whence it came, from within or without; and when it has gone, we say, “It was here. Yet no; it was beyond!”<sup>42</sup>

The above passage may tell more than Plotinus perhaps intended. The Good appears to Intellect, but when it does the Intellect is not sure whether it was

here (in Being) or beyond (Non-Being). Perhaps this statement unconsciously and unintentionally records not the inadequacy of Intellect, but the self-contradictory nature of The One.

## V

In the last analysis, what can be said about the validity of Plotinus' theory of The One? Plotinus employed two separate and distinct kinds of metaphysical languages to speak about the One, and unified these by means of a third kind of language that was originally designed as paradoxical. It should now be obvious that that term is not accurate; for a paradox is only a seeming contradiction, whereas it is most clear that the third mode of discourse is intrinsically self-contradictory. This point emerges clearly in Plotinus' attempt to explain the origin of Being through the notion of a Beyond-Being that causes itself and thus all other things. Self-causation is the logical and metaphysical miracle that is needed to ground ontological and meontological discourse in a more fundamental reality: the unification of Being and NonBeing, of all things and no thing. If then, Plotinus' theory concerns not merely the notion that The One can be described both ontologically and meontologically, but also *requires* that both descriptions merge into a higher paradox, then that theory must be accounted self-contradictory and impossible.

But this is not all. For the dilemma that arises from the superimposition of the first and second modes of discourse arises, *mutatis mutandum*, in describing the relation between *Nous* and The One. Consequently, any attempt to bridge the relation between the first two Hypostases by means of causality is bound to end in the same impossible self-contradiction.

Is the tradition of positive and negative theology brought to an end with these considerations? While this final question invites a lengthy response, I would like to offer just a few suggestions here.

The third or paradoxical mode of discourse is actually an altogether different and distinct kind of discourse from the first two. While it employs the first two as its “matter,” so to speak, its form is intrinsically different. The impossibility of the third mode of discourse does not imply the impossibility of the first two modes if those modes are kept distinct and not combined into some kind of more ultimate language. There may be good reasons for speaking of Non-Being, and for speaking of Being; but there are no good reasons for believing they are the same or causally related. To use Plotinian terminology, both the First and the Second Hypostases, both The One and *Nous*, may be real; but neither can have the qualities of the other, and no causal language can be used to show their unity potentially or actually.

In short, positive and negative theology may have some justification if and only if they are not subsumed into a single, unified theology. Positive and negative theology have as their respective metaphysical concerns Being and Non-Being. The boundaries between them must be respected if contradictions are not to arise.

To suggest that positive and negative theology are not concerned about the

same underlying reality is fatal to any monism, whether theistic or pantheistic, and thus to much of Western religious thought. Ironically, however, it was Plotinus and his progenitors who provided one of the few nonmonistic theologies of the West. Thus while Plotinus' final solution to the problem of the relation between positive and negative theology is unacceptable, it may be to Plotinus, and not to the Western religions, that we must look to find a satisfactory solution to this very problem.\*

\*I wish to express my gratitude to Dr. John Kultgen and Dr. Joseph Bien, both of the University of Missouri at Columbia, for their helpful advice and criticisms.

## *Vertical Causation in Plotinus*

MICHAEL F. WAGNER

The core of Plotinus' philosophy is his theory of the progression (*πρόοδος*) with its three hypostases: the One, Intellect, and Soul. The theory states, roughly, that Intellect is a progression from the One, that Soul is a progression from Intellect and that this progression is the real metaphysical foundation of our universe. Accordingly, the bulk of contemporary scholarship on Plotinus has focused upon understanding the hypostases, their progression and their relation to our universe, and various related textual and philosophical issues.

In this essay, I shall focus upon Intellect—the Plotinian successor to Plato's Forms—and its relation to our universe. This second concern will require some discussion of Soul as well. I shall present an interpretation of Intellect and its progression that challenges some assumptions commonly made by Plotinian scholars. I shall also give serious treatment to Plotinus' criticisms of Aristotelian categorial theory and Aristotelian hylomorphism and to Plotinus' use of "Being," "Same," "Different," "Motion," and "Rest" in *Ennead* VI. Finally, I shall explain the primary philosophical role which the theory of progression plays in Plotinus' philosophy: What philosophical work does the theory of progression do for Plotinus?

As with any systematic interpretation of a philosopher, my interpretation of Plotinus may require some adjustments and qualifications as it is brought to bear on more and more actual texts. Moreover, I shall not commit myself on issues of Plotinus' consistency throughout the entire *Enneads* on all points of his philosophy. I shall, however, tie my interpretation to significant texts and I am convinced of the spirit, if not all the details, of my interpretation.

One assumption commonly made by Plotinian scholars is that Plotinus embraces a real *physical* world. John Rist, for example, seems to attribute a real physical universe to Plotinus throughout *Plotinus: The Road to Reality*, with the possible exception of his chapter "The Sensible Object." A. H. Armstrong, similarly, discusses Plotinus' views about the *physical* universe throughout chapter 14 of *The Cambridge History*, although Armstrong also makes the puzzling and apparently inconsistent claim that "Plotinus is so concerned to stress the unreality of matter that he makes it very clear that anything observable in the *material universe* . . . is form, not matter" (p. 231; my emphasis).<sup>2</sup> Perhaps Plotinian scholars do not make this assumption and I have misconstrued their talk about the physical or material universe, but they are certainly confusing on the matter. I shall argue, in contrast, that Plotinus definitely does not embrace a real physical universe.

Accounts of Intellect and its progression commonly take what might be called Plotinus' noumenatic vocabulary as basic in the *Enneads*.<sup>3</sup> Contemplation, intellection, intelligibles, and the like are commonly taken as Plotinus' most perspicuous notions for explicating the nature of his Forms and of Intellect's progression. Thus, Armstrong maintains that for Plotinus

our thought about intellect, if it [is] to have any content at all, must be a thought of something thinking about something, and thus involve a certain duality [of subject and object] (p. 237).

And Armstrong concludes that the Plotinian Forms, which compose Intellect, are to be construed as "a community of living minds" (p. 245).

I am less concerned with the Mentalistic twist which Armstrong gives to Intellect than I am with the exclusive emphasis upon Plotinus' noumenatics. In particular, I shall argue that Plotinus' noumenatics is not basic; it does not provide the philosophically most perspicuous way of construing Intellect and its progression. I shall not explicitly challenge any of the claims made within noumenatic interpretations of Plotinus. Rather, I shall examine the place of Plotinus' noumenatics in his complete philosophy and challenge the unquestioned importance placed upon it by Plotinian scholars. Without a doubt, Plotinus' noumenatics—which I shall also call his "vulgar" account, for reasons to be explained—dominates the *Enneads*. But this show of numbers does not prove that it is most basic to the philosophical theory presented in the *Enneads*. It might only show, for example, that Plotinus thought that it would be most perspicuous for (or perhaps acceptable to) the audiences at hand.

## I

The only text I shall use in this section is *Ennead* VI.6, Plotinus' treatise "On Numbers." *Ennead* VI contains, on Porphyry's ordering of Plotinus' treatises, the most basic and philosophically precise presentations of Plotinus' philosophy. In *Ennead* VI, moreover, treatise 6 serves as a bridge between, on the one hand, Plotinus' discussions of categorial frameworks for doing metaphysics (treatises 1–3) and of the relationship between Intellect and the world we perceive (treatises 4 and 5) and, on the other hand, Plotinus' grand concluding treatises on the intelligible structure of Intellect and on the nature of the One and its relation to Intellect (treatises 7–9). I maintain that the contents of Plotinus' treatise on numbers more than justifies the place Porphyry accords it in *Ennead* VI.

Plotinus recognizes that, for most of us, reality is (or seems to be) composed of the things we perceive and which we ordinarily use our language to mention, namely, men, trees, colored things, eyes, and so on. A philosophical theory need not canonize these ordinary realities, but it must provide a basis for our talk and perceptions of them. Accordingly, the theory of progression need not be couched, when presented in its strictest and most proper form, in language obviously based upon our ordinary talk of men, trees, and so on, but it must admit of *some* characterization that grounds that talk—a characterization that renders our ordinary realities "well-founded" if not real *tout court*. Throughout most of the *Enneads*, Plotinus does couch his theory in this latter form. *Ennead* VI.6 is unique and indispensable in its stress upon the derivative status of this characterization.<sup>4</sup>

In *Ennead* VI.6, Plotinus argues that an arithmetical characterization of the progression is basic. Plotinus argues that "the One and Number are primary" (VI.6.10.50), so that beings "come to be in accordance with Number" (VI.6.15.24). Accordingly, we may talk about there being a Being (or Beings) for men—call it (or them) *man*—when basing our metaphysical account on the words of ordinary speech, but the Being(s) we are thereby referring to is really arithmetical in character: *man* is, at bottom, a principle or group of principles for ordering things in a certain way.

Thus, Number, the First and the True, is the principle [ἀρχή] and underlying source of reality (VI.6.15.34).

Plotinus takes the initial progression from the One to be a breaking up of the One into a succession of numbers. As an initial progression from the One, the numbers are unities (see VI.6.10). Plotinus also calls these numbers "the First Numbers" (VI.6.15.34). And the first or pure numbers are to be distinguished from numbers as actually functioning to order or "number" things. The pure number Two, for example, is to be distinguished from "two" functioning to order dyads of trees, apples, parts of houses, and so on. The pure numbers that progress from the One function as arithmetical ordering principles by means of Soul. When Soul orders things in accordance with the order of pure numbers, the numbers are

no longer just the resources of pure arithmetic but become principles of ordering. Plotinus calls the numbers functioning as principles of ordering "schemata," or "those which measure things in accordance with the Firsts" (VI.6.15.39).

In *Ennead* VI.6.6, Plotinus argues that the real nature of Being (or the Forms) is number functioning as schemata. Now Plotinus' claim that pure numbers progress from the One implies that they come to be in a successive and orderly manner. Plotinus does not himself spell out the theory of numbers or of arithmetical foundations which underlies his moves, and I shall not discuss Greek and Hellenistic arithmetic (and geometry) here. The point for now is that Soul's use of numbers as schemata is constrained by the ordered successiveness of the pure numbers as they progress from the One. Soul uses pure numbers so that the schemata are related to one another in a hierarchy, with more complex schemata coming from simpler schemata. In view of the general conflation in Greek and Hellenistic thought of geometry and arithmetic, moreover, the hierarchical relations of the schemata may be understood in terms of the derivation of geometrical theorems from one another and, ultimately, from the axioms and primitives of geometry.

Plotinus maintains that the extensional magnitudes of geometry result from applications of arithmetical principles of ordering to the phantasms of perception (VI.6.3.38). As we shall see, space (or extension) is a necessary feature of our using sensations to perceive things and does not exist apart from that use. Geometrical principles are thus derivative from arithmetical principles in that they are just arithmetical principles construed in terms that apply to the extended things of perception. Construed geometrically, however, the hierarchical relationship between schemata may be understood in terms of, say, the derivation of principles concerning triangles from the more basic principles concerning plane figures.

In sum, we may articulate the principles of ordering used by Soul by doing geometry, construing them as principles of geometrical objects. Ultimately, however, "enclosed" figures are measured by "discrete" figures (numbers) (VI.6.14.40). Plotinus maintains that things of magnitude do not come from real principles except insofar as their parts form a unity that is arithmetically measurable (VI.6.1.16), the extendedness of those parts again being a feature of the phantasms of sense. Two points will complete my initial sketch of Plotinus' doctrine of Intellect and its progression.

First, I have emphasized that the initial or "pure" unities function as schemata in a stepwise, orderly fashion, beginning with simpler principles from which more complex principles follow (also see VI.6.11). As the schemata become more and more complex, we get schemata which are complex enough to ground all of the structural distinctions we make concerning our ordinary realities. To show how the progression of schemata does this, we may take more complex schemata to be composed of arithmetical parts (subprinciples of ordering or subschemata) which are each further complications of the arithmetical parts of simpler schemata. In this way, we can break schemata down into the subschemata that make them up. The highly complex ordering principle(s) which is the arithmetical-cum-

geometrical foundation for some man, for example, is composed of subprinciples for what we would call the man's organs (his eyes, arms, and so on).

We now have the following picture of the progression from the One. First, the One breaks up into a succession of unities, or pure numbers, which provide the foundation for Soul's orderings of things (also see VI.6.10.1-4). This provides an arithmetical-cum-geometrical foundation for structurally explaining the things we perceive and describe as men, trees, and so on. In using the numbers so that more complex schemata follow from simpler schemata, moreover, Soul introduces the means for talking about subschemata. In the words of our language, some of these subschemata are principles for ordering certain enclosed figures of sense into what we call "arms." Others are principles for ordering certain other things we perceive—or, from the point of view of each of ourselves, our visual sensations themselves—into what we call "eyes." And so on. My mention of "the words of our language" leads into the second point.

Earlier I noted that, while Plotinus' progression is at bottom arithmetical (-cum-geometrical) in character, Plotinus feels that it also provides a ground for our ordinary conceptions or talk of men and trees. This means that every distinction we perceive and have words to describe and conceptualize has a real counterpart distinction in the schemata of Intellect. We may talk about the principles and subprinciples used by Soul in words based upon our ordinary language and need not always be doing arithmetical sciences. In the last paragraph, for example, we talked about subschemata as being ordering principles for the things we call "arms," "eyes," and so forth. We might call these subschemata "the real arms," "the real eyes," and so on—or, more generally, "the real organs." And we might call the portion of hierarchy of principles-cum-subprinciples that we might appeal to in "measuring" an ordinary reality-man, "the real man." Plotinus maintains that the metaphysical principles of our ordinary realities—which he also calls "the bodylike things" (VI.6.17.25)—are schemata, but we can refer to them in terms of "what it is to be a certain living thing" or as "the First living things" (VI.6.17.34-36); for example, as what it is to be a man or as the First man. *Ennead* VI.7, the treatise following "On Numbers," seems designed to present Intellect in this derivative way, as justified by *Ennead* VI.6.

The distinctions generated in Intellect's progression do not ground only the structural distinctions we commonly make in our ordinary realities. There are enough distinctions generated there to ground other distinctions as well. Plotinus at one point represents the initial progression from the One as providing the foundation for all the characterizing sorts of things we say about men, trees, etc., as well—that is, for our characterizing things as having qualities, as having quantities, and so forth (VI.2.21). Viewed in this way, the initial progression from the One might be thought of as a successive production of the basic predicates of a descriptively adequate language—perhaps, for example, the predicate *is six feet tall* or the predicate *is red*. The Soul's use of numbers that function as schemata becomes a use of predicates that cohere into batches of characterizings. When the Soul uses those batches to inform our perceptions, they are thereby applied to a

subject. As a result, we apprehend a sortal thing by means of characterizing it (e.g., a man that is six feet tall and red). Accordingly, we might also call the batch (or batches) of predicates which ground our perceptions of men "humanity" or, in my convention, *man*.

My second point brings us to the topic of Plotinus' noumenatics. For, when the forms are construed in such an ordinary language-based way, the appeal to relations between arithmetical-cum-geometrical principles and their foundations in pure numbers and to the relations between a more primitive principle and a more derived principle in characterizing the progression of Intellect and Soul will not do. Other terms are needed. To characterize the progression of Beings (*man*, etc.), Plotinus uses the language of "intellection," "intelligibles," and, most importantly, "contemplation" (θεωρία). I have insisted in this section that this is a less perspicuous way of characterizing the progression for Plotinus; but it is also the more common way in the *Enneads*, as most of the *Enneads* seems addressed to various less sophisticated audiences which came to learn from Plotinus—the "vulgar," as it were.

In Section II, I shall supply more detail to the proper (arithmetical-cum-geometrical) way of viewing the progression. I shall also deliver on my introductory remarks concerning physical things. In Section III, I shall return to the terms of the "vulgar." Both sections, moreover, will center around the idea that Plotinus' theory of progression is primarily intended as providing a proper framework for understanding our universe—in a phrase, for real explanation of Plotinian science.

## II

Plotinus maintains that the theory of progression is a theory about the real causes of our universe. In order to maintain this, Plotinus' conception of causation must be quite different from that of many modern and contemporary philosophers and, as well, from that of Aristotelians. I shall begin my discussion of some details of Plotinus' theory of progression with a discussion of causation, especially contrasting Plotinus' views with those of Aristotelians.

The notion of causation commonly has several associations not found in Plotinus, and one association which is the basis for Plotinus' denial of the others. One association is change. In preparation for my discussion of Aristotelian hylomorphism, we may distinguish two sorts of change: substantial change and change in the state of some substance. Thus, when a stone is thrown through the air and breaks a window, the change in place (motion) of the stone is a cause and the change in the window is an effect. Substantial change occurs when a substance comes into existence or ceases to exist, and may be reduced to changes in state if a person maintains that the passing away or coming to be of a substance is really a change in the state of some perduring matter. All causes and effects thus become changes in the state of some substance or matter. Substances that cause changes in state may be called "agents" and substances (or matter) that suffer effects may be

called "patients." This general discussion of causation and change leads to some further associations.

First, states of substances are datable, and so changes take time or occur in time. More generally, causes and effects occur in time and agents and patients exist in time. As a result, atemporal items are commonly excluded from the causal order and references to time may be packed into analyses of causation—for example, as in the principle that a cause must precede or occur simultaneously with its effect.

Second, substances and pieces of matter are particulars. Hence, agents and patients are commonly taken to be particulars; causes and effects are particular states or changes in state. A person can (and we often do) make general causal claims (e.g., that smoking causes cancer), but actual causal connections occur only between particulars (e.g. between individual histories of smoking and individual cases of cancer). As a result, items that are not particulars (e.g., species or principles of geometry) are commonly taken to be outside of the causal order and therefore to be "abstract" rather than "concrete."

Third, regardless of a person's position on the existence of nonphysical particulars, physical bodies certainly seem to be clear instances of particulars which may be agents or patients, as in my example of the stone and the window. (But, again, even the Mentalist's nonphysical agents or nonphysical datable states are particulars—e.g., selves and volitions.) The physical universe is thus commonly taken to be a prime example of a causal order.

I shall call a theory which associates causation with change, temporality, particularity, or physicality a *theory of horizontal causation*. The problems with theories of horizontal causation are well known. One problem such theories have to face is how a relation between particular (hence, contingent) things or "states" (however loosely construed) could be a necessary relation. Another related problem is how, even assuming that horizontal causes may be necessary, we could ever be certain that we have a necessary connection in doing science (or anything else, for that matter). In view of such problems, causation (either as such or as knowable by us) often becomes nothing more than, for example, a conjunction of particulars or of particular states in a temporal sequence. Causal laws become inductive generalizations or expressions of probabilities, subjective expectations, or relations between the concepts by means of which particulars are apprehended.

Plotinus holds what I call a *theory of vertical causation*. On Plotinus' theory, the real causal order is atemporal (eternal) and unchanging; bodies are never causal agents and, indeed, bodies as founded on the real causal order are not particulars or physical at all. Only principles or Forms are real (vertical) agents and are, in this sense, concrete. Real "bodylike things"—men, trees, etc., as given a place in the real causal order—are "copies" of principles (or schemata). Using some Leibnizian jargon, real bodies are noumenal, where the contrast with noumenal bodies are not *physical* bodies but "things" apprehended by means of sensations—that is, *phenomenal* bodies.<sup>5</sup> A noumenal body is, in short, a schema as being the real foundation for (or, from here on, being the explanatory cause of)

the perceptual objects we ordinarily take to be the real causes of our sensations. In Section I, I called noumenal bodies and their parts "the real organs," "the real man," or "the real tree." Our ordinary realities are really only phenomenal bodies for Plotinus.

A common association with causation that Plotinus does accept is that appeals to causes must yield explanations. But Plotinus sharply distinguishes perceptions of a world of phenomenal bodies from real explanation. Horizontal causes and effects are features of the world we discern (*αἰνέειν*) by means of the materials of sense.<sup>6</sup> But the discerning of phenomenal bodies is an activity which, as such, *explains* nothing about the things discerned. For an analogy to this discerning or perceptual making, a sculptor's sculpting of a statue provides a basis for explaining the statue only insofar as his motions and the resulting statue fall under principles of craftsmanship and they are considered as following in the order of principles, that is, being noumenal.

Intellect is the agent which, on Plotinus' theory, causes the noumenal universe to exist (and in a way the phenomenal universe as well). Soul is the activity by means of which the vertical progression and the end product of a universe is brought about. Body, construed as making a positive contribution to Soul's activity (namely, rendering its products phenomenal in the case of Soul's perceptual activities), is characterized by Plotinus as a "dumb" laborer (IV.3.26.7). And noumenal body, or body truly considered as following from principles of ordering, is not even a "dumb" laborer—it does not act at all—but is introduced in the progression as a result of introducing the notion of *Soul's* acting. Soul, on the other hand, is essentially active in that it is always the imparting of actuality to (or the making of) body, or "the other" (I.1.2.2–8). And Soul gets its principles of making from Intellect, so that Plotinus also characterizes Soul as the means by which (*διὰ μέσου*) Intellect acts (IV.3.11.18).

The idea that Soul is a progression from Intellect is implicit in the claim that Soul is that by means of which Intellect acts. Intellect acts only and always by means of Soul so that the function of Intellect is to render the universe ("the others") intelligible. Conversely, Soul is essentially active only in virtue of its being the acting of Intellect so that the universe which comes to be in Soul's activity is wholly intelligible. Intellect and Soul thus function together in Plotinus' system so that the universe is explainable and is neither physical nor wholly phenomenal.

In order fully to articulate Plotinus' framework for explanation, the progression, we must distinguish four kinds of soul: the hypostasis Soul, the World Soul, species souls, and individual souls. If these four kinds of soul are not distinguished for Plotinus, much of the *Enneads* become unintelligible. The mention of Soul in the context of discussing phenomenal bodies addresses individual souls. My use of "Soul" in Section I addresses the World Soul. And my claim that men, etc., are ultimately to be traced into the noumenal order only as "copies" of the Forms or schemata and not as items which add a positive nature of their own to the causal order (e.g., a physical nature) addresses Soul. What was said in Section I about organs, finally, has a bearing on species souls.

Intellect simply produces a universe by means of Soul (IV.3.11.18). But within this most basic role of being Intellect's acting, soul is said to be a one from which the "soul of the all" and all the "other souls" come (IV.3.4.14–16). The soul of the all is the World Soul. By means of the World Soul, the universe is led into a unison (*συνθονία*) in accordance with reason (or ratio) (IV.3.12.15). This means that, on the one hand, the basic positive notion of the way Intellect acts is by arithmetically ordering things and that, on the other hand, the ordering activity of Intellect is most clearly seen in the regular and "symphonic" motions of the phenomenal heavens.

The "other souls" are individual souls, the means by which Intellect acts by means of the schematic copies of the World Soul so that we may ascribe activities to noumenal bodies themselves. The only sort of case here that Plotinus is interested in is conceptual activities of noumenal men—that is, our discernings of a phenomenal world and our reasoning. Whether the motions we ascribe to phenomenal animals and plants are to be seen as due to individual souls in the noumenal world or whether these are somehow due just to the World Soul alone is unclear in the *Enneads*.

Finally, in addition to the World Soul and individual souls, there are also souls that are "fastened in a succession to each of the Intellects [Forms], being the rationales and unfoldings of them" (IV.3.5.9–10). These are species souls and they are based upon the idea introduced in Section I that more complex schemata follow from simpler schemata in such away that their increasing complexity comes from complications of the arithmetical components of simpler schemata. When this idea is articulated in terms of the systematic way in which the World Soul schematizes noumenal bodies, we have the idea of species souls—but much more on this later.

The fourfold distinction between kinds of soul may be directly expressed in terms of the distinction between noumenal and phenomenal bodies—the products of soul's activities. Three ways in which Plotinus talks about bodies are especially relevant. First, qua produced by Intellect: bodies are simply "copies of the Beings" (III.6.11.3). As seen in Section I, however, the most proper way of talking about the real nature of Being is arithmetically (and/or geometrically). Qua being produced according to principles of order when produced by means of Soul, secondly: bodies are "schematized things" (*σχημάτισμα*) (IV.4.33.34). As we shall see, Plotinus takes the initial products of schematization that all more-complex schematizations order to be air, earth, fire, and water (V.9.3.15–18). Third, qua being objects discerned by means of sensations: bodies are "perceptual objects" only—in my words, phenomenal bodies.

A crucial step in Plotinus' argument is the claim that in using sensations to discern a phenomenal world, we are not thereby discerning the real nature of bodies. Plotinus claims that his own conception of bodies is based upon the absence of reality (*ὑποστάσεως*) in phenomenal bodies as such (III.6.12.10).<sup>7</sup> We ordinarily suppose that bodies are colored, emit sounds, and so forth. But in reality, (noumenal) bodies "have nothing of the sorts usually supposed of them" (III.6.12.24). Plotinus does not even ascribe sensory shape (*μορφή*) to real bodies.

Color is likewise said to be an appearance ( $\theta\alpha\lambda\upsilon\sigma\theta\alpha\iota$ ) of what is not really colored (III.6.12.31).

At least part of Plotinus' reason for claiming that phenomenal bodies are "unreal" is that they are not causes or causal agents; they are always just products of individual souls' uses of sensations in perceiving. They are thus, in my words, not concrete. The men, trees, and so forth, that we perceive do not really cause even our sensations of them. The origins of our sensations or impressions ( $\tau\acute{\upsilon}\tau\omicron\tau$ ) may be initially accounted for in terms of their having external, bodily causes. We might say that color sensations, for example, result from light activity in a medium initiated by an external luminous body (IV.5.7). Or we might say that sound sensations result from air vibrations, again initiated by some external body (IV.5.5). And analogous accounts can, presumably, be given for the other senses (except insofar as we would say that a medium is not required). In general, however, Plotinus says very little about the "horizontal" mechanics of sensations and perceptions.

Two important points need to be made here. First, Plotinus does clearly hold that a noumenal (ultimately, arithmetical-cum-geometrical) backing can be given to those horizontal accounts of causation that take bodies to be structural in nature. Plotinus seems quite satisfied with standard structural (perhaps Stoic) accounts of the horizontal mechanics of sensations and perceptions. Second, the reason why Plotinus himself shows a lack of concern for actually giving any detailed horizontal accounts is the theory of vertical causation and his overriding concern to emphasize the philosophical point of that theory. On the theory of vertical causation, real explanations are to be given in terms of Intellect's acting by means of soul, and any horizontal account must be cashed out in terms of its noumenal backing if it is to be shown to be of any real explanatory value. Plotinus hints at doing just this in *Ennead* IV.5.7, replacing the horizontal account in which light proceeds from a luminous body with an account in which something simply *is* (or has its being) in accordance with the form of luminous body (IV.5.7.36). Let us now look more closely at Plotinus' conception of bodies in order to clarify matters.

Plotinus' theory of vertical causation carries with it a doctrine on the real nature of bodies, as I have already hinted. In particular, real bodies are noumenal in nature; real bodies are men and the like considered solely as being the orderings prescribed by schemata, and they are not the phenomenal bodies we commonly identify with them. As a result, Plotinus' reply to a question like, "But what is being *ordered* by schemata?" must not introduce a material base or receptacle but must be couched in terms that can be unpacked in terms of the noumenal order alone. Accordingly, Plotinus holds what I call a noumenal hylomorphism, according to which noumenal bodies are complexes of matter and form but where "matter" and "form" is to be unpacked in terms of the stepwise way in which the World Soul acts.

Plotinus' noumenal universe may be thought of as having the most basic or simple orderings—call them air, earth, fire, and water—which the World Soul renders more and more complex as it mimics or copies the hierarchy of schemata.

Air, earth, fire, and water become "matter" for complex things by being associated with the four "first" or simplest schemata from which the World Soul works in its progressive activity. And if one asks Plotinus, "But what receives the first, most basic orderings?," his answer would have to be that nothing does; we must start somewhere, so let us start with something intelligible in nature rather than with any of the "bastard notions" (to adapt Plato's well-known phrase) of previous metaphysicians.

Plotinus takes Aristotle to be a prime example of a metaphysician who imports such "bastard notions" and who takes particulars to be real causal agents. An integral part of the Aristotelian conception of causation is the doctrine of hylomorphism, according to which particulars are informed matter. Plotinus rejects Aristotelian hylomorphism as a doctrine of the nature of real bodies. Plotinus' schematized things are indeed complex, but not in the Aristotelian manner. Moreover, the four elements which serve as "matter" for schematization are themselves not complex at all, just being the first and most basic acts of the World Soul. Being the firsts that all subsequent schematizations presuppose, the elements are called "simples" by Plotinus. Plotinus argues that elemental fire, for example, does not come to be by a substrate's receiving some sort of shape or by something's being set on fire (III.6.12.37). Plotinus rejects the notion of a substrate that receives shape (III.6.12.11), insisting that elemental fire is just a feature of the vertical order itself.

Plotinus' general explication of hylomorphism in *Ennead* V juxtaposes his own noumenal hylomorphism for complex bodies with an Aristotelian account of the elements or "simples."

We see neither the things which are said to be wholly complex nor the simples as a one. . . . Thus, on the one hand, those naturally more complex things—the ones with substructures and which we call "compounded together"—divide first according to the Form which constrains the whole compound: a man, for example, first divides into a soul and a body, the body dividing in turn into the four elements. But, on the other hand, there are also those "compounds" [the simples] which result from matter having been shaped; for the matter of the elements is by itself shapeless. And, you will ask, from whence does the form come into matter? . . . But here too, the account [hylomorphism] has it, the substrate receives shape (V.9.3.8ff).

Plotinus shifts in this passage using "soul" and "body" when discussing complex things to using "shape" and "substrate" when discussing the elements. The reason for this shift in vocabulary is that hylomorphism is not wholly misguided in the case of complex bodies. Complex bodies are indeed complex, albeit not complex through being Aristotelian-informed matter. But no such concession is to be made for a hylomorphic construal of the elements. Phenomenal fire (the fire we see)—for example, the fire I discern in the fireplace—may be construed as complex, being a perceived subject which is hot or colored; but real elemental fire is not complex at all (IV.4.13.19–25).

As Plotinus sees it, the doctrine that real bodies are informed matter (or shaped substrate) misuses the fact that phenomenal bodies are always taken by us

to be compounds (IV.4.13.19–25). Aristotelian hylomorphism takes our ordinary, perceptually based beliefs as serious metaphysical accounts of the real universe. We ordinarily take phenomenal bodies (“the things we see”) as compounds (e.g., round balls, red barns) and Aristotelian hylomorphism turns this belief into a metaphysical doctrine about the real nature of bodies. Being a general metaphysical doctrine, moreover, the resulting hylomorphism is then applied even to the elements.

Plotinus maintains, in contrast, that the only sort of distinction that can be drawn in real bodies must be based upon something within the vertical order of the schemata. The only distinction there which would seem to do the job is the distinction between more complex schemata and simpler schemata; or, what comes to the same thing, the coming-to-be of a more complex schema from a simpler one in such a way that it is composed of subschemata or noumenal parts. In the case of the simplest schemata—those whose pure arithmetical foundations lie in the first numbers in the progression from the One—no such distinction can be drawn. The first schemata have no subschemata because there are no still simpler schemata for them to come from; they are therefore “simples,” and may be taken as the real foundations for the elements of a physics.

After the simples, however, the activities of the World Soul may be taken as complications on the initial schemata (the elements). And at each stage in the World Soul’s schematizing after the elemental stage, we can distinguish between the complications of the four elements (call it “body”) and the fact that the resulting complex ordering is a structural unity in its own right, in virtue of its schema—the schema used by the World Soul owing its unity in turn to its being just a complication of a simpler schema, and so on up to the simplest schemata. Plotinus calls the structural unity of a complex ordering “the form constraining the whole” or just “soul,” where the sort of soul being mentioned here is what I have called species soul. A species soul is a schema qua unifying an ordering activity of the World Soul. Plotinus also calls species souls “capacities” (δυναμεις) and their connection with schemata is as follows:

Schemata have capacities, for the one is together with the other and vice versa. It is by means of capacities and schemata, then, that each [noumenal] thing is schematized and comes to be. . . . Thus, schemata are essentially such that they have capacities (IV.4.35.46–49).

Earlier I noted that a more complex schema may be thought of either (1) as a whole which is just more complex than a simpler schema, or (2) as a whole whose greater complexity may be broken down into subschemata. Accordingly, the noumenal (ultimately, arithmetical) items or “elements” that come to be in an ordering activity of the World Soul may be thought of either (1) as being just items in the ordering as a whole, or (2) as items in suborderings which, in turn, are ordered into the “measurable” whole. Taken in this latter way, Plotinus calls the capacities (species souls) that order noumenal items first and foremost into suborderings and only derivatively into the whole “capacities to undergo”

(παθητικοί). Taken in the former and more direct way, Plotinus calls the capacities just “capacities”; he does not introduce a special term for them. I shall call them “capacities proper.”

Expressed from the “vulgar” or phenomenal-body side, capacities to undergo are those capacities whose actualizations—the items they order—must occur in some one organ of the body. The capacity for vision, for example, is a capacity to undergo because whenever it is actualized, the eyes are the patients in which it is actualized (III.6.2.53).<sup>8</sup> In the noumenal body, actualizations of the capacity for vision are those noumenal items which are ordered into certain suborderings (the noumenal eyes), these suborderings providing the noumenal foundations for ordering visual sensations into phenomenal eyes.

Unlike actualizations of capacities to undergo (call them “undergoings”, actualizations of capacities proper (call them “activities”) are not essentially ordered into particular noumenal (and, derivatively, phenomenal) organs. Man’s perceptions and reasonings are clear Plotinian examples of activities in this sense, so that conceptual activities differ from sensory or “bodily” undergoings (at least in part) in that their structural role is prescribed by the noumenal body as a whole rather than by noumenal organs.<sup>9</sup> Speaking with the vulgar, my eyes sense colors while I (as a whole, as a person, or whatever) perceive colored things.

Put in more schematic terms, Plotinus’ idea seems to be that impressions (τύποι) are sensations to the extent that they are ordered by the subschemata of noumenal bodies, and impressions are, at the same time, used by the soul to discern things to the extent that their role in the noumenal body as a whole is such that they partially replicate the orderings that we call “other things”—for example, the noumenal body grounding the phenomenal tree I am discerning or the noumenal body grounding the phenomenal moon you and I are both discerning. In this way, certain orderings in my noumenal body play roles relative to my whole noumenal body that replicate the structural roles played by items ordered into other noumenal bodies relative to those whole noumenal bodies. As a result, we have a Plotinian “vertical” counterpart to the Aristotelian idea that sensation is the taking on of the ratio of another thing without its matter, which is subsequently used by the percipient’s soul to perceive that other thing.

We might say for Plotinus that in perception my phenomenal body *represents* another phenomenal body (or some feature of it), with the caveat that my representing is grounded in a structural replication of some other noumenal ordering and not in there being some really existing phenomenal body which, say, causes my sensations. We may go along with the horizontal theorist a bit, as Plotinus is prepared to do, and talk about a sensation’s being, say, a counterpart-redness to the redness of a phenomenal body I am perceiving. But the real, noumenal account must be kept in mind to unpack this.

I have thus far argued that Plotinus’ real causes are not particulars or physical things. In addition, I have discussed Plotinus’ rejection of Aristotelian hylomorphism, which is a principal source of the idea that causation involves change. In rejecting Aristotelian hylomorphism and maintaining that the basic model of cau-

sation is the coming-to-be of a more complex principle of ordering from a simpler one, Plotinus also rejects the idea that causation involves change. A related association which I have not explicitly addressed is temporality.

I shall close this section by emphasizing that Plotinus' progression does not occur through time and that his real (noumenal) universe does not exist in time as such, though it grounds those things (phenomenal bodies) that we discern as existing in time. Time and space are both relegated by Plotinus to the phantasms of sense, and they may be said to be "in" the noumenal order only to the extent that those phantasms are grounded in noumenal bodies (and, in turn, in schemata). I shall discuss time and space more as we proceed. I shall now return to the fourfold distinction between kinds of soul.

I have distinguished between Soul, the World Soul, species souls, and individual souls. At bottom, though, there is only one soul for Plotinus. Souls and what it is to be soul ( $\psi\upsilon\chi\eta\ \epsilon\iota\nu\alpha\iota$ —that is, the hypostasis Soul) are eternally one and the same, Plotinus maintains, where to be soul is to impart actuality to "the other" (I.1.2,2–8; IV.7.8.40–46). The imparting of actuality, in turn, is the same as the activity of Intellect. It is, as it were, Intellect progressing beyond itself, actually ordering "things" rather than being just principles of ordering. Strictly speaking, then, souls are identical with the activity of Intellect, and that activity is the only activity that really occurs in the universe. How, then, do the World Soul, species souls, and individual souls "come to be"?

Though Intellect's activity is the only real activity in the universe, that activity (i.e., Soul, or the production of the universe) can be analyzed by us in various partial ways in our attempt to articulate the vertical order and its relation to the ordinary realities we perceive. Since being is really principles of ordering, for example, Intellect's production may be thought of as orderings of schematized things, with the four elements of Greek and Hellenistic physics being grounded in the simplest or first stages of that schematizing. Soul is now being construed as the World Soul. Species souls come to be as by-products of the World Soul's activity, being expressions of the fact that the World Soul's activity reflects the systematic interrelationships between the schemata of Intellect and between the schemata and their arithmetically based (numerable) components. Individual souls are the most troublesome here. Roughly, they are certain whole orderings *qua* using sensory items, as discussed previously. Individual souls are also to be viewed for Plotinus as abstractions from what is really one, singular activity of Intellect.

The World Soul, species souls, and individual souls are not distinct from Soul but are notions derived by focusing upon (abstracting, in my sense of the word) certain features of Intellect's singular activity. The most difficult feature of Plotinus' views on the matters being discussed here is that Plotinus never gives us a clear account of precisely how we can move from noumena to phenomena and remain solely in the single vertical order (e.g., how phenomena can be mere abstractions from the noumenal order). Even if one maintains, as I am prepared to argue that Greek and Hellenistic philosophers do, that our sensations are not themselves objects, there still seems to be something about the phenomenal world that

renders it *phenomenal* rather than noumenal, and Plotinus does not give an account of how that something comes to be in the vertical order. Thus, while Plotinus gets rid of the receptacle, substrates, and, in general, any basis for a real physical world, it is unclear how he gets rid of a positive foundation for there being a phenomenal world as such. It is one thing to say that men, trees, and the like, are really just noumenal orderings and quite another to say that Plotinus has thereby fully accounted in some manner for phenomenal men, phenomenal trees, and the like, as such and without remainder. I shall not pursue this issue here, but assume that I can get on with my explanation of Plotinus without settling the issue.

Plotinus summarizes the theme of the previous few paragraphs by maintaining that one and the same soul is identically present "everywhere" (IV.2.1; IV.3.2,3) but it can be considered as "becoming divided in regard to [first noumenal and then phenomenal] body" (IV.3.19.15). This last does not result in a real multiplicity of souls, however, because mention of various items called "bodies" is an abstraction from the single productive activity of Intellect. Similarly, Plotinus emphasizes my atemporality theme by claiming that in order to grasp bodies as they really are, we must consider the noumenal copy of Intellect in accordance with the eternal manner in which it comes to be as an entirety (IV.3.10.12). We must think of real body as coming from Intellect "all at once" (V.8.7.17) and not serially or by a succession of acts.<sup>10</sup> Intellect's production of the universe is not just the only *kind* of real activity there is in the universe; there is only one such act—the production of the noumenal universe as an eternal whole. In short, Plotinus maintains, the *universe* is a copy of True Substance (Intellect) only when taken as a timeless whole (VI.3.3.31). No abstractable part of it is a copy, those abstractable parts themselves being in time only when apprehended by means of sensations, as particulars discerned by individual souls.

### III

Section II focused on Plotinus' conception of causation, emphasizing more what it is not than what it is and relying on the discussion of Section I for filling in the latter. In its most basic formulation, Intellect's progression is strictly analogous to the derivation of more derived theorems of arithmetic (and/or geometry) from more basic theorems, and these in turn from the basic axioms and primitive resources of arithmetic. Soul enters the theory of progression as the notion of principles of ordering actually yielding orderings. The progression stops with the soul's activity, however, and the question, "What is thereby ordered by Soul?" is a bad question in Plotinus' view. As a result, however, I have noted the difficulties which Plotinus is left with concerning sensations and the discerning (or from the vertical order's point of view, abstracting) of a *phenomenal* world.

This section will develop the account Plotinus gives of the progression in terms that more directly ground our talk of men, trees, etc.—what in my introduction I called Plotinus noumenatics. But in so doing, I shall also emphasize certain features of the proper account, for example, that each lower level in Intellect is an

arithmetical-cum-geometrical complication of a higher level which is "derived" from it rather than adding something to it. Important details will be added to the proper account as well.

Plotinus maintains that the best way for us to understand in a more ordinary or "vulgar" way how the progression of Intellect occurs is in terms of the notion of contemplation (θεωσις). Plotinus argues that "natural production" is not a matter of "pushing and levering" (III.8.2.5).<sup>11</sup> It is not a matter, for example, of arranging or rearranging material atoms or of pushing on and impressing a material substrate. In *Ennead* III.8, Plotinus argues that natural production is a matter of contemplation. By natural production, Plotinus has in mind the production of the real universe; but, as we shall see, the notion of contemplation is also used by Plotinus for the progression of Intellect itself.

I shall focus on the more basic progression, that of Intellect itself, and discuss how Plotinus' contemplation account supplements the proper account outlined in Section I. My discussion will have three parts. First, I shall discuss Plotinus' view that Aristotelian metaphysics does not provide an adequate framework for real explanation. Second, I shall discuss why an Aristotelian framework is inadequate. Third, these two discussions will provide a basis for explaining Plotinus' framework and the sort of ground Plotinus feels his framework provides for more "ordinary" Platonic explanations of men, trees, etc. in terms of contemplation.

Plotinus discusses Aristotelian categories in *Ennead* VI. 3, and he argues that they provide a means for categorizing the phenomenal world which, like Aristotelian hylomorphism, will not do for a serious metaphysical account of the real universe. Plotinus' own Aristotelian-type categorial framework for the phenomenal world begins with two basic categories: substances and things concerning substances. A substance is that which is "neither in a subject nor concerns another subject" (VI. 3.5.14–15). Socrates or a man is a substance, for example, because in discerning something as Socrates or as a man, we are discerning the subject of the perception itself rather than a subject as relative to something else. A man is not a man *of* some subject; rather, a subject of perception just *is* a man.

Plotinus then divides things concerning substances into what he calls "categories" and accidents. Plotinus "categories" are the obvious relative-to's (πρὸς τι) of Aristotle's *Categories*—for example, a slave, which is relative to a master, or a cause, which is relative to an effect. To call them relative-to's means, roughly, that a slave is not a slave unless there is some other subject that is a master. In short, there are slaves in the world if and only if there are masters which the slaves are the slaves *of* (VI.3.3.31).

Unlike "categories," an accident is not relative to some *other* subject, but it is still a relative-to. A color, for example, is always a color *of* something (in particular, *of* some substance—a man, a tree, etc.). In general, a quality, for example, "is a capacity to impute by means of itself the 'what a quality is' to substances" (VI.1.10.19). That is, qualities are such that we impute the "what they are" (e.g., white) to substances. A similar remark holds for all accidents, which include quantity, quality, and *space* and *time* as well (VI.3.3). As a result,

things concerning substances collapse into relative-to's; they always presuppose something else for their existence in the world, and so this something else is always needed in any explanation of them. Substances help explain things concerning substances but not vice versa.

The next, and most important, step Plotinus makes is to reduce substances to relative-to's as well. Substances are not relative to other substances (or subjects of perceptions) but they are still relative-to's. In particular, the substances of the phenomenal world are relative to our perceptions (or discernments) of them. The substances of the phenomenal world depend for their existence upon our perceptions rather than helping explain the phenomenal world. Phenomenal bodies are items that individual souls make by means of sensations, and their substance is a result of that making.<sup>12</sup> Accordingly, Plotinus defends his reduction of substances to relative-to's by cautioning that

what has been said is not absurd since the account concerns the substance of a perceptual object . . . [and a perceptual object is always] relative to a perception (VI.3.10.12–14).

Plotinus' basic criticism of Aristotelian-type categories is that they apply to things only relative to our discernments of them. The phenomenal world is to be explained by means of what explains our perceptions, and it does not exist independent of our discerning it. In order to see why this result renders Aristotelian-type categories inadequate as a framework for real explanation, a few more explicit words about the nature of relative-to's are needed. As we shall see, it is not just being a relative-to that disqualifies a category from serious metaphysical usage; it is being a relative-to that is relative only to our conceptual activities (e.g., perceptions), which disqualifies a category in this way. Plotinus maintains that a categorial framework for real explanation must explain or constrain our own conceptual activities as well as the ordinary realities we initially wanted explained. This brings us to the second part of this section.

As Plotinus sees it, real explanation must consist in giving reasons (λόγοι); and reasons—I shall also call them "rationales" to clearly distinguish them from the activity of reasoning (διανοία)—are tied up with relative-to's in two ways: first, in their internal structure and, second, in their relations to what they are reasons *of*. The first is based on the fact that rationales are always more complex than what they are rationales *of*. "Everything comes out as compounded," Plotinus claims, "when analyzed by means of rationales and reasoning" (IV.3.9.19–20).

Using the Aristotelian doctrine that bodies are informed matter as an example, we can say that "informed matter" is a rationale of "bodies" and that the items in the rationale are each relative to the other. The sense of the term "form" and the sense of the term "matter" each depend upon the sense of the rationale informed matter, so that nothing is informed but matter and matter must always be informed. The first sense in which rationales generally are tied up with relative-to's is analogous to this Aristotelian example, that is, a rationale is always a complex whose parts are essentially relative to one another. The significance of this point

for explanatory rationales and for distinguishing them from nonexplanatory rationales can be brought out by using Plotinus' own example of the relative-to's *double* and *half*.

Double and half are relative to one another (for short, they are correlatives) because they

occur relative to one another . . . and such that the former is not prior to the latter and vice versa, but they occur simultaneously (VI.1.7.34–38).

The import of this passage is that nothing is a double or a half by itself but only relative to something else. Four, for example, is a double only relative to two, and two is a half only relative to four. Moreover, four is not a double in virtue of two's being ■ number, being less than four, or whatever, but only insofar as two is simultaneously taken as a half. In short, correlative terms perspicuously apply only together and not separately.

A further and more important point, however, is that four may also be a half (viz., when considered relative to eight when eight is simultaneously taken as a double). A similar point can be made about two's being a double relative to one taken as ■ half. Thus, this pair of correlatives, double and half, are variable in their applications to numbers and to things.

I have just noted two features of correlatives. First, correlatives are mutually dependent upon one another; they apply only together and not separately. Second, at least some correlatives are variable or "mutable." Something might be a double when considered relative to one number, for example, and a half when considered relative to another number. It is this second feature of certain correlatives that renders them inadequate for use in a rationale that really explains something. Plotinus feels that a real explanation must employ rationales which apply immutably. This brings us to the second way in which rationales are tied up with relative-to's; namely, in the relation between a rationale and what it is a rational *of*.

The second way in which rationales are tied up with relative-to's may be introduced by saying that the correlatives internal to a rationale do not apply to something(s) *in vacuo* but only from what I shall call "a point of view." Four is the double of two and two is half of four, for example, only from the point of view of their numerical ratio. More importantly, Plotinus maintains, on the basis of what was said in Section II about Aristotelian hylomorphism and what has been said in this section about Aristotelian categories, that body is informed matter (or a substance-thing concerning substance compound) only from the point of view of human percipients. Real explanatory rationales, in contrast, must apply from a point of view which humans *may* occupy but which does not depend essentially upon their doing so. This second restriction on explanatory rationales is related to the first in that one test for whether or not a rationale depends essentially upon humans occupying the point of view from which it applies is whether or not there is any variability in how we use it.

Plotinus argues in *Ennead* VI.2 that a categorial framework which makes real explanation possible is provided by "Being, Same, Different, Motion, and Rest."<sup>13</sup> I

shall call these five the *Platonic genera*. To what extent Plotinus' use of these five is the same as Plato's (e.g., in *Timeaus* or *Sophist*) will not be discussed here. Plotinus' motivation for adopting the Platonic genera, presented in *Ennead* VI.2.7,8, uses the notion of relative-to's (or correlatives). That motivation may be understood in terms of the doctrine that explanatory rationales must not be variable in their application or depend essentially upon human perceivers (or, more generally, conceivers).

In particular, Plotinus maintains: (1) The items in a Platonic rationale are always different; thus, a Platonic rationale always applies to something only as a different; and (2) the point of view from which rationales of different apply is just Sameness itself. Anyone who begins with Plotinus' principles of being (the Platonic genera) taken as primitive must, in principle at least, always arrive at the same explanation or set of rationales. In sum, Plotinus takes the Platonic genera to prescribe a methodology (generally called "dialectic") for systematically and non-arbitrarily arriving at a set of rationales and which, therefore, determines how we reason rather than our reasoning determining the rationales.

The foregoing introduction of the Platonic genera indicates that Same and Different are the most important of the five. In *Ennead* VI.2.7,8, Plotinus explicates the function of the Platonic genera as follows. Motion accounts for the basic progression of Intellect. But Rest applies simultaneously with Motion, so that the "motion" of Intellect is eternal. The nature of Intellect's motion is unpacked in terms of Same and Different. More precisely, Intellect's motion is unpacked in terms of differentiation, and differentiation is based upon Different; for "everything after a differentiation stands dual [or as a dyad], destroying the One" (VI.2.9.16). Moreover, differentiation presupposes that there is something that is differentiated—something that the resulting differentials are different *of*. Accordingly, Same enters as the point of view from which differentials *are*. Rationales which articulate Intellect are, in short, dyads of differentials which each apply in virtue of a same.

Thus far in this section, I have discussed what is inadequate about Aristotelian-type frameworks for doing metaphysics and why the Platonic genera will do the job. This last can be seen more clearly by relating my discussion of the Platonic genera to the account outlined in Section I. Recall that in its initial progression from the One, Intellect is a succession of the resources of pure arithmetic (cum-geometry). Similarly, we have just seen that the "motion" of Intellect is a successive differentiation into dyads. From the One, taken as Same rather than as the *tout court*, Different yields a dyad. From each different in that dyad, we get another dyad, and so on.<sup>14</sup> Taken as the pure progression of a first dyad from the One and then of successive dyads from the pure differentials of the first and of each subsequent dyad, Intellect is the resource for pure arithmetic. Taken as the ground for the basic resources of our language, these differentials are forms called after the predicates of our language; they are no longer "pure" but now have "conceptual content." Taken in this latter way, moreover, the progression of Intellect from the One is a genus-species hierarchy.

Plotinus summarizes the dual way in which the progression of Intellect may

be construed, and in a manner which preserves the point made in Section I that the latter ("vulgar") way is secondary to the former (arithmetical), as follows:

All intellectual objects are structured into one nature, such that Intellect is composed of all of them. This we call Being, and it is a system. If this is the case, then not only are they [i.e., the Platonic genera] genera but they are at the same time the principles holding for Being. They are genera because from them come other lesser genera and after those come species and finally the uncutables [or atoms]. And they are also principles because Being is thus from a many and the entire thing [i.e., Intellect] comes from them (VI.2.2,8–14).

In this passage, which expresses the view Plotinus proceeds to adopt later in the treatise, Plotinus argues (1) that the Platonic genera generates Intellect as a genera-species hierarchy, but (2) this hierarchical construal of Intellect is secondary to the Platonic genera's being principles—principles (*ἀρχαί*) which, according to *Ennead* VI.6, generate the successive unities-cum-schemata of the proper account. The most proper sort of rationales to be given in real explanation are schematic; they are nonarbitrary and they determine human arithmetical-cum-geometrical reasoning for Plotinus, as truths of arithmetic and/or geometry do for many other philosophers as well. Moreover, this same sort of necessity is shared by genera-species hierarchies articulated by using our language and conceptual abilities as the material for dialectic, the counterpart in the genera-species case to arithmetical deduction being contemplation, to which I shall now turn.

Plotinus is sensitive to what his metaphysics does and does not allow us to say about the real universe. Two related things that Plotinus' metaphysics does *not* warrant us in saying are: (1) that principles and real bodies differ from one another spatially or temporally, and (2) that principles differ from one another in some more "ontologically grounded" sense than just that one is expressible by a more or by a less complex rationale (or level of rationales) than another one is—whether these rationales be expressed in the words we use doing arithmetic or geometry or in the more ordinary words we use in articulating genera-species hierarchies.

Contemplation is an especially useful notion in emphasizing these two points because, as Plotinus understands it, contemplation is an activity in which one understands something by producing or exfoliating what is implicit in it—as when a geometer seeks to understand geometry by tracing the entailments of its basic axioms and primitives.<sup>15</sup> Applies to Intellect, the idea becomes that Intellect progresses by means of contemplation in that every lower level of differentials is an articulation of (rather than an addition to) what is implicit in a higher level, in view of the "primitives" and "axioms" of being—that is, the Platonic genera and how they function.

The essential feature of contemplation is that it is the articulation of something implicit in the resources used by the contemplator. Spatiality and temporality are not essential features of contemplation as they are with "pushing" and "levering"—and as temporality at least might be in the special case of a *human* contemplator. Plotinus emphasizes the atemporality of contemplation as such in saying that

producing has been revealed by us to [in reality] be contemplation. For it is the perfection of a contemplation to remain contemplation and not to be *doing* any particular thing. With respect to what it is, we might say that contemplation is a "having had produced" (III.8.3.21).

Plotinus expresses the second point above, that "ontological difference" in Intellect is solely a matter of differing complexities in the rationales (or levels of rationales) used to articulate its implicit structure, in terms of contemplation as well, claiming that a rationale is really *both* a contemplation and the object of the contemplation (III.8.4).

A rationale is an object of contemplation in virtue of its complexity and it is also a contemplation in virtue of its unity.<sup>16</sup> As in the case of species souls, the distinction between the unifying measure (or unity) of a particular level in Intellect and the simpler level from which it comes is a distinction that collapses; the distinction collapses because, throughout his account, Plotinus has in mind that everything in Intellect is already implicit in the Platonic genera. It really does not matter except for certain limited exegetical purposes where we draw the line between what is in one level of Intellect and what is in another level. All that matters here is that Intellect does provide the ground for our articulating systems of explanatory rationales that do represent Intellect as a derivational system. Plotinus expresses this basic point in terms of contemplation as follows:

The One is both in itself and relative to the many others. And the One is also Being, making itself into many by means of a kind of motion [i.e., differentiation]. But the resulting whole is still a one, just as contemplation is a one which works in various ways. Thus, the Being-One does not remain in itself but is the capacity for all things. And contemplation is the cause of its appearing many, such that there is intellection. For if only the One appeared, there would be no intellection but only the One. (VI.2.6.13–20).

In sum, when we move from the proper account of the progression to the "vulgar" account, Plotinus takes contemplation as the model for how the progression proceeds and what it "does," as contemplation is the articulating of what is implicit in being or, more anthropomorphically, becoming conscious of what is in one's own mind. As a result, there is a clear sense in which contemplation (or the resources of contemplation) controls the contemplator rather than vice versa. This last, of course, brings Plotinus' use of the notion of contemplation in line with the two demands for explanatory rationales discussed earlier.

Plotinus' noumenatics are indeed to be taken seriously—I do not deny that. Plotinus' noumenatic account is, however, derivative from his account in terms of pure differentiation—the successive generation of the resources for arithmetically based sciences. The connection between these two accounts lies in that the resources for our language or conceptual abilities admit of genus-species articulation. The structure of our conceptual abilities is like that of Intellect, and it provides the means for our endowing the pure sameness and differentials of Intellect with content. More precisely, I would argue, at another time, that Plotinus takes the conceptual content of our language to be due to its having a structure—its

items playing structurally describable roles, so that Plotinus can say that the structure of Intellect causes the conceptual content of our language rather than, strictly speaking, our language endowing Intellect with content. But the subtleties of this point need not detain us here.

## *The Ontological Basis of Plotinus' Criticism of Aristotle's Theory of Categories*

CHRISTOS EVANGELIOU

Aristotle uses or refers to the theory of categories in all his major works. The small treatise which is known to us by the conventional title *Categories*<sup>1</sup> is devoted exclusively to the exposition and elucidation of this theory. Traditionally, the treatise is included in the collection of the Aristotelian logical treatises and is considered a part of the *Organon*.<sup>2</sup> Ever since the first edition of the Aristotelian corpus prepared by Andronicus of Rhodes in the first century B.C., *Categories* has been the subject of numerous commentaries and debates among Platonists, Peripatetics, Stoics, and Neoplatonists alike.<sup>3</sup> The debates were considered philosophically important for the reasons that Dexippus has summarized and explained.<sup>4</sup> Plotinus was a later participant in those debates. Although he did not prepare a technical commentary on the *Categories*, Plotinus wrote a long treatise, an ἀντιλογία,<sup>5</sup> against Aristotle's theory of categories. In a long series of Platonists who found Aristotle's categories unacceptable, Plotinus was the last to criticize them.<sup>6</sup> Porphyry, Plotinus' most distinguished disciple, editor, commentator, and successor as head of the Neoplatonic school in Rome, was to put an end to the debates about Aristotle's categorial doctrine. In his two commentaries on the *Categories*,

Porphyry proposed an ingenious interpretation of Aristotle's categories designed to show its defensibility in theory and its usefulness.<sup>7</sup> As a result of Porphyry's work, after the third century A.D. and for many centuries to come the *Categories* was incorporated in the Neoplatonic logical tradition and Plotinus' ἀντιλογία was forgotten. Yet, for the student who is interested in the history of the categorial doctrine and its transformations, Plotinus' criticism of the Aristotelian categories is important for at least two reasons: first, because Plotinus is both the last and only critic whose arguments and critical remarks have been preserved in a complete form; and secondly, because his criticism is directed not against the logic but against the ontology that underlies Aristotle's categorial doctrine, so that it is devastating in its intentions, to say the least.

This essay does not offer by any means a detailed exposition and assessment of Plotinus' many and at times complicated arguments against each of the ten Aristotelian categories. Its limited scope is to explore critically the underlying principles of Plotinus' criticism of the Aristotelian categories. It is an attempt to establish the thesis that both Plotinus' rejection and his reduction of Aristotle's categories are based on grounds and considerations that are not logical but ontological in essence. It will show that, regarding the problem presented to Neoplatonism by Aristotle's categorial doctrine, Plotinus' position was determined by two basic factors: (1) the Neoplatonic ontological distinction between the intelligible realm of real being (κόσμος νοήτος), and the sensible realm of mere becoming (κόσμος αἰσθήτος) related to each other as archetype (ἀρχέτυπον) to its image (εἰκών); and (2) the strictly ontological interpretation of Aristotle's categories which Plotinus follows. By considering the categories as "genera of being," this interpretation juxtaposed Aristotle and Plato and had to be abandoned by Porphyry, who sought the reconciliation of the two philosophers. It will become clear, I hope, that Plotinus was neither an Aristotelian in his theory of categories nor in the sense in which his disciple, Porphyry, may be called an Aristotelian.<sup>8</sup>

## II

Plotinus' criticism of Aristotle's categories is to be found in his treatise περὶ τῶν γενῶν τοῦ ὄντος (*On the Genera of Being*). This treatise is divided into three books or parts which, according to Porphyry's thematic arrangement of the Plotinian treatises, constitute the first one-third of the sixth *Ennead* (VI.1, VI.2, VI.3). Part 1 deals with the Aristotelian tenfold (VI.1. 1–24) and the Stoic fourfold (VI.1. 25–30) theories of categories. Plotinus finds both these sets of categories unacceptable for the reason that they are irrelevant and inapplicable to the realm of real being (κόσμος νοήτος).<sup>9</sup> Part 2 is entirely devoted to an elaborate exposition of Plato's five *summa genera* which Plotinus considers to be both the only genera applicable to the realm of real being and the "highest genera" (πρώτα γένη) of that realm. Part 3 deals with the realm of mere becoming (γινόμενον), considered as ontologically other than the realm of real being. Here Plotinus proposes a set of five categories that may be called "genera" with some allowance, but never "genera of being." Plotinus' set of categories is a radically reduced and

modified list of the Aristotelian ten categories insofar as the number and the names are concerned. With the "genera of being," Plotinus' categories of becoming share in the same number, five, and some of them share the same name, which opens the door to homonymy and its dangers (VI.3.1 19–21).

From the title of Plotinus' treatise (as well as from its opening paragraph), it is clear that his purpose is to discuss the question of being (περὶ τῶν ὄντων) and to determine both the right number and the real nature of the "genera of being," in case there is a plurality of *onta*. It is precisely because he takes Aristotle's categories to be competitors of Plato's genera for the high position of the "genera of being" that Plotinus thinks it necessary to criticize and reject the former as incompatible with the latter. The only merit of the Aristotelian tenfold division of ὄντα, according to Plotinus, is that it avoids the fallacies of both the uncritical ontological monism, which reduces all kinds of being to one genus, and its contrary view which holds that *onta* are infinite in kind, thus making scientific knowledge (ἐπιστήμη) impossible (VI.1.1.8–9).<sup>10</sup> Plotinus thinks that Aristotle was right in proposing a definite number of genera, but he was wrong in proposing ten instead of five, as Plato had done. It is Plotinus' opinion that on this matter he is in complete agreement with Plato. In VI. 2, he defends Plato and restores his five γένη to the high position of "genera of being." Having done so, he opens VI.3 in the following way: "We have now explained our conception of Reality (True Being) and considered how far it agrees with the teaching of Plato."

However, it would be mistaken to assume that the only fault with Aristotle's categories is their number. Even if they were less than ten, the Aristotelian categories would have to be rejected for their ontological claims. The reason for this is given by Plotinus as follows: "These thinkers [the Peripatetics] are however not considering the Intellectual realm (νοητὰ) in their division; the Supreme (τὰ μάλιστα ὄντα) they overlooked" (VI.1.1.28–30). Accordingly, the Peripatetics erred in that their categorial net was intended to capture only the phenomenal world of becoming which they mistook as the real world of being which, in turn, they overlooked. It was precisely this Aristotelian mistake—to distinguish between the two levels of reality—that provided Plotinus with a basis for attacking Aristotle's categories and their ontological claims. It may be well, then, to consider in some detail the historical ontological distinction between real being and mere becoming.

## III

The doctrine of the existence of two ontologically distinct realms of being, the authentic and its image, goes back to Plato's cosmology and the "likely story" told in the *Timaeus*, as is well known. It seems that the epistemological distinction between true opinion (δόξα ἀληθής) and knowledge (ἐπιστήμη) provided the grounds on which Plato based the ontological distinction between the sensible and the intelligible worlds.<sup>11</sup> In Plato's figurative language, we are told that the two realms are related as original or pattern (παράδειγμα) to its imitation or image (εἰκών).<sup>12</sup> However, neither in the *Timaeus* nor in any other dialogue did Plato

explain precisely (1) how the sensibles relate to the intelligibles, or (2) how the intelligibles are related to each other, or (3) what is the first unifying principle (or principles) (ἀρχαί) of all things. On the contrary, in a characteristic passage Timaeus remarks that no one should imagine that he has the right or the power to undertake so great and difficult a task.<sup>13</sup>

Now, it is true that in the *Sophist*, where the discussion is about the possibility of combination of Forms (συμβλοκή εἰδῶν), Plato uses five γένη (genera; kinds or Forms) in order to prove his thesis that some forms can combine and some cannot, with the corollary doctrine that each Form is both being and non-being at the same time without violating the law of contradiction. Plato's five γένη are: Being (τὸ ὄν), rest (στάσις), motion (κίνησις), sameness (ταυτόν), and difference (ἕτερον).<sup>14</sup> They are called "μέγιστα γένη," an expression that may mean either the "most general genera" or "the most important Forms." In Plotinus these five all-pervasive Platonic Forms are identified as "genera of being" which, in turn, are said to constitute the realm of the authentic being as its principles (ἀρχαί) and its elements (στοιχεῖα): "We have here not merely genera, but genera which are at the same time principles of Being. They are genera because they have subordinates—other genera, and successively species and individuals; they are also principles since from this plurality Being takes its rise, constituted in its entirety from these its elements" (VI.2.2.10–14).

Let it be noted here that the expression "genera of being" (γένη τοῦ ὄντος) is Plotinus' coinage. Neither Plato nor Aristotle ever used it. However, given (1) the fact that Plato's εἶδη or γένη ("forms") are ὄντως ὄντα ("really real entities") and αἰὲ ὄντα ("unchangeable") in contrast to the sensible things that are always in the process of becoming and never actually are, and (2) the possible meaning of the expression "μέγιστα γένη" construed as "the most general and pervasive forms," it may seem permissible to use the combination "genera of beings" (in plural). This would mean that the Platonic five γένη are real beings qua Forms, and that they are genera of the other forms, by virtue of their capability to be predicated of all forms. From this possible Platonic position to that of Plotinus, who considers the five genera as both predicable and generative principles of being (in singular), there is a considerable distance. Is it possible to cover this distance without overstepping the limits set by the Platonic *Timaeus*? Plotinus thinks it is.

Be it as it may, the important point is that throughout the *Enneads*, and especially in the treatise *On the Genera of Being*, the fundamental ontological distinction between the two realms is taken for granted. Unless it is taken seriously under consideration, and stressed, a great part of Plotinus' philosophy and particularly his criticism of Aristotle cannot be properly understood and appreciated. Passages like the one that follows must be read with this ontological distinction in mind in order to make sense:

But a graver problem confronts us at the outset: Are the ten found alike in the Intellectual and in the Sensible realms? Or are all found in the Sensible and some only in the Intellectual? All in the Intellectual and some in the Sensible is manifestly impossible.

At this point it would be natural to investigate which of the ten belong to both

spheres, and whether the Existents of the Intellectual are to be ranged under one and the same genus with the Existents in the Sensible, or whether the term "Existence" (or Substance) is equivocal as applied to both realms (VI.1.1.19–24).

If we compare the respective sets of genera of the sensible and the intelligible realms, it will be easier to understand Plotinus' answer to the questions raised above:<sup>15</sup>

REALM OF REAL BEING		REALM OF MERE BECOMING	
1. Οὐσία (ὄν νοῦς)	Substance	οὐσία (λεγόμενη)	so-called substance
2. Κίνησις (ζωὴ ἐνέργεια)	Motion	ποιόν (ποιότης)	quality
3. Στάσις (ἀεὶ εἶναι)	Rest	ποσόν (ποσότης)	quantity
4. Ἔτερον (ἕτεροτης)	Difference	κίνησις (ζωή)	motion
5. Ταυτόν (ταυτότης)	Sameness	πρός τι (σχέσις)	relation

Now, Plotinus' answers to the questions raised in the preceding quoted passage are as follows: (1) the number of the "genera" of becoming is the same as the number of the "genera of being," that is, five; (2) some genera of the sensible realm, such as quality and quantity, are found in the intelligible realm as well, but they are not primary (πρῶτα) in the sense that the five authentic "genera of being" are primary (VI.2.13–14); (3) it is impossible to have more genera in the intelligible realm than in the sensible realm, for the reason that the one, as simple, displays a greater unity than the other, the compound;<sup>16</sup> (4) to range under one and the same genus the authentic ὄντα of the intelligible and the so-called "ὄντα" of the sensible would be as absurd as to make "one genus of Socrates and his portrait" (VI.2.1.24–25); (5) even if some genera of the sensible realm (e.g., οὐσία) share the same name with one of the real genera of being, no one should be misled by the equivocation.

Given this ontological distinction between being and becoming, Plotinus has no difficulty in drawing the conclusion that Aristotle's categories, which were not intended for the realm of being but for that of becoming, cannot be "genera of being," let alone the "highest" (πρῶτα) genera for which he was searching. If his premises are granted, Plotinus' conclusion seems to follow. But Plotinus does not stop here. He is prepared to go so far as to question whether Aristotle's categories can be called even simple "genera" in the Aristotelian logical sense of this term. In this respect, Plotinus' criticism appears more realistic and more challenging. Since the term "genus" is instrumental to his strategy of attacking Aristotle's categories, it will be well to take a look at the various meanings of the term and Plotinus' use of them.

To use an Aristotelian expression, the Greek word "γένος" is a πολλαχῶς λεγόμενον, that is, it has more than one meaning and can be used in more than one sense. Basically, two usages of this term may be distinguished: the common

or nontechnical usage, and the technical or philosophical usage. The first relates to generation, while the second usage relates to predication. Since generation involves both generators and generated, the meaning of the term "genus" is split. So for the parents, "genus" refers to their offspring collectively, whereas the parents themselves are said to be the source (*ἀρχή*) or genus (*γένος*) of the offspring, and more so the father as the more active of the two generators. In this sense, the genus of all Hellenes is Hellen who was their first generator.<sup>17</sup> With regard to predication, "genus" is a predicable. In a proposition, it usually occupies the position of the predicate, but every generic term with the exception of the highest genus (*γένος γενικώτατον*) can also be the subject of the proposition. As Aristotle puts it, "genus" is also the "first constituent element" of definition and stands to differentiae as matter stands to form.<sup>18</sup> Also, things are said to be "other in genus" if they cannot be analyzed into one another or into some other thing. It is in this sense that the categories are said to be "other in genus."<sup>19</sup> As a technical, logical term, "genus" is defined as follows: "A 'genue' is what is predicated of things exhibiting differences in kind."<sup>20</sup>

To return to Plotinus now and the "genera of being," for which he is searching and from which he excludes Aristotle's categories, it may be useful for our understanding to keep in mind the following: (1) the Plotinian genera must be the "highest" (*πρώτα*) genera, that is, not subject to predication which would reduce them to species; (2) they must be able to be predicated equally (*ἐπίσης*) of what is subordinated to them; (3) above all they must be endowed with generative power implied in the nontechnical sense of the word "genus," so they may function as principles (*ἀρχαί*) of being and as "genera of being." According to Plotinus, Aristotle's categories (a) do not meet evidently the criterion of (3); (b) they do not meet (2) because *ousia*, for example, is not equally predicated of matter and form (VI.1.2.9–10); (c) they do seem to meet the criterion of (1) since they are not subject to predication, but to call them *πρώτα* would be false since it would be misleading to call them "genera of being" given the ontological distinction between being and becoming and their restriction to the latter; (d) they are not "other in genus" because they are analyzable or, to say the least, half of them are (VI.1.13–14. 23–24).

Thus far, Plotinus has tried to approach Aristotle's categories negatively. In other words, he has tried to determine not what the categories are but what they are not. In his view, they are not "genera of being." Moreover, they are neither the "highest genera" nor even "genera," strictly speaking. In drawing these conclusions, Plotinus follows simply the premises (1) that reality is ontologically divided into two realms, and (2) that Aristotle's categories do not apply to the higher level of reality. Also, his broad conception of "*γένος*" as a predicable term of which nothing can be predicated and as powerful generative principle or source, has some bearing in the exclusion of the categories from the realm of real being. Even so, one may wonder what the Aristotelian categories are, in Plotinus' understanding, and how they function. Plotinus' answer to questions like these is that the categories—which Aristotle calls falsely genera and genera of being<sup>21</sup>—are simply categories of becoming. He means by this that the categories lack the unity that the genera possess. In his opinion, they are loose classifications based on

some common characteristics shared by groups of sensible objects of the phenomenal realm. Thus, the referential efficacy of the categories is restricted to the lower level of reality and their unifying power is lesser compared with that of the genera, in the Plotinian sense of the term.

Consequently, Plotinus' lengthy discussions of the four basic Aristotelian categories (namely, substance, quantity, quality, relation) lead to the same conclusion that none of them is a genus. A simple comparison of the following relevant passages may help to clarify this point:

The properties adduced may indeed be allowed to distinguish Substance from the other Existents. They afford a means of grouping substances together and calling them by a common name. They do not however establish the unity of a genus, and they do not bring to light the concept and the nature of Substance (VI.1.3.19–23).

. . .

Equality and inequality must be regarded as properties of Quantity-Absolute, not of the participants, or of them not essentially but only accidentally: such participants as "three yards' length" which becomes a quantity, not as belonging to a single genus of Quantity, but by being subsumed under the one head, the one category (VI.1.5.22–26).

. . .

If however the Reason-Principles (governing the correlatives) stand oppose and have the differences to which we have referred, they may perhaps not be a single genus, but this will not prevent all relatives being expressed in terms of a certain likeness, and falling under a single category (VI.1.9.27–30).

. . .

Again, not all qualities can be regarded as Reason-Principles: chronic disease cannot be a Reason-Principle. Perhaps, however, we must speak in such cases of privations, restricting the term "Qualities" to Ideal-Forms and powers. Thus we shall have, not a single genus, but reference only to the unity of a category (VI.10.40–42).

Let it be noted here that these four Aristotelian categories, together with *κίνησις* ("motion")—evidently a new Plotinian category of Platonic roots—constitute the set of five "genera" which are "different" (*ἕτερα*) from the "genera of being" and are proposed by Plotinus for the realm of *becoming*. As to the other six Aristotelian categories, Plotinus thinks that they can be reduced to the above five basic categories. Thus two Aristotelian categories, to wit, action and passion, can be subsumed under the category of motion, which is a genus of becoming analogous but different from the homonymous genus of being (VI.3.21–27). For the categories of *ποῦ* ("where" in place) and *πότε* ("when" in time), Plotinus proposes that they may be reduced to space and time, respectively, which in their turn may be reduced to the category of quantity (VI.1.13–14). As for the two last categories in the Aristotelian list, possession and situation (*ἔχειν, κείσθαι*), in Plotinus' view, they are combinations of two or more categories, so that they cannot be simple and without combination (VI.1.23–24).<sup>22</sup>

Plotinus' position that most of Aristotle's categories are reducible and unnec-

essary is a strong position and amounts to a serious criticism because it challenges the doctrine of categories in the very domain of the sensible world that it was intended to render intelligible and knowable. If Plotinus' criticism is well-founded, then the implication will be that Aristotle did not know what he was doing when he postulated more categories than he needed. Starting with Porphyry, the later Neoplatonist commentators had a difficult task in their efforts to defend the irreducibility of Aristotle's categories.<sup>23</sup> However, the fact that they were able to defend successfully Aristotle and rescue him from Plotinus' severe attack indicates that the Plotinian method of criticism was somewhat objectionable.

To defend Aristotle against the charge that his categories do not apply adequately to the intelligible realm and, consequently, that they do not qualify for the position of "genera of being" was certainly not that difficult. For after all, one may not see the reason why Aristotle's categories (which were not intended for the intelligible realm, as Plotinus admits) should be criticized for their being inapplicable to that realm. Following this line of argument, Dexippus attempted to give an answer to Plotinus' questions regarding Aristotle's categories and their relations to the real being.<sup>24</sup> Yet, the question still remains: What was the reason for which Plotinus first considered Aristotle's categories as "genera of being," and then made this very consideration the basis for his criticism of the Aristotelian categorial doctrine? This question should be discussed in the light of the historical fact that in the third century A.D. there were various competing interpretations of this doctrine.

#### IV

It is known that, according to an established tradition, the commentator of a classical treatise was supposed to discuss and settle a few preliminary questions before proceeding to make his comments on the text. In the later commentaries, these questions are to be found codified as follows: (1) Who is the author of the treatise? (2) What is its correct title (ἐπιγραφὴ)? (3) What is its purpose or subject (σκοπός, πρόθεσις)? (4) What is its order? (5) What is its utility? and (6) What is its division into chapters? With regard to Aristotle's *Categories*, the most debatable of the above questions were (2) and especially (3).

It is understandable that the late commentators had to debate the issue of the correct title of the treatise, given the fact that more than one title had been preserved. Thus they had to choose among the following alternatives: *Ten Categories*, *Categories*, *On the Ten Genera*, *On the Genera of Being*, and *Pretopics*.<sup>25</sup> A commentator was expected not simply to choose, but also to defend his choice. To take an example, Porphyry thought, as we today think, that the correct title of the treatise was Κατηγορίαι and provided reasons to support his position and to reject the other proposals.<sup>26</sup> He particularly argued that the treatise should not be titled περὶ τῶν γενῶν τοῦ ὄντος, contrary to Plotinus.<sup>27</sup>

It is not difficult to see that closely related to the question of the correct title of the treatise was the more important question of its purpose. The title of a treatise is usually indicative of its content and the purpose it serves. It is no

accident that the choice of the title of the treatise on categories, which a commentator or critic prefers, reflects in a way his position and interpretation of its purpose. This brings us to the central and difficult question of the purpose of Aristotle's *Categories*. What are the categories? Are they classifications of words, things, concepts, or what? On this question neither the ancient commentators nor the modern scholars seem to have reached an agreement. These are four possible answers to this question and all of them had been tried by the time of Porphyry. Since then they have been repeated with more or less fidelity. By way of labeling these interpretations, the following scheme is obtained:<sup>28</sup> (1) the grammatical or phonetic interpretation, (2) the ontological or pragmatic interpretation, (3) the psychological or noetic interpretation, and (4) the logical or synthetic interpretation.

It falls outside the limited scope of this paper to analyze the arguments and counterarguments by which the supporters of each of the above interpretations of the Aristotelian categorial doctrine tried to support their respective positions. To comment briefly on each of them, it may be said that interpretation number (1) claims that the categories are word or sounds (φῶναι) and about words. The opponents of this view contend that to deal with φῶναι *qua* φῶναι is the task not of the philosopher but of the grammarian, and Aristotle was not a grammarian. The supporters of (2) think that the categories are about beings or things (ὄντα, πράγματα). The main objection to this view is that it takes the treatise out of the *Organon* and makes it a part of *Metaphysics*, where the discussion is of ὄντα *qua* ὄντα. According to (3), the purpose of the treatise is to deal neither with φῶναι nor with *onta*, but with the intermediary νοήματα ("concepts"). But to deal with concepts *qua* mental entities and processes is the task of the psychologist, not of the philosopher. The fourth (4) and evidently more enlightened view considers the other three as one-sided and attempts to synthesize them by claiming that the categories are about significant sounds (φῶναι σημαντικαὶ) which signify things (πράγματα) by way of signifying concepts (νοήματα).<sup>29</sup> After Porphyry, who gave a definite formulation to this interpretation by emphasizing the role of φῶναι σημαντικαὶ, every commentator of Aristotle's *Categories* took pains to make it clear that he followed the synthetic or logical interpretation.

To return to Plotinus, it may be useful to know that he was a follower of the strictly ontological interpretation (2) of the categorial doctrine. On this we have Simplicius' testimony.<sup>30</sup> Being consistent with this interpretation, Plotinus (a) titles Aristotle's treatise not *Categories* but *On the Genera of Being*, as we have seen; (b) considers the categories in their claims as "genera of being"; (c) views the categories as competitors of Plato's μέγιστοι γένη for the position of "genera of being"; (d) thinks that he has to choose between Plato and Aristotle on this matter, and (e) criticizes and rejects Aristotle's categories as irrelevant and inapplicable to the realm of real being, but he thinks that with some modifications they can serve the realm of becoming.

However, Plotinus' successors, who found it difficult to choose between Plato and Aristotle, had to abandon the ontological interpretation of the categorial theory in their efforts to reconcile the two philosophers. Thus Porphyry proposes a

new interpretation that placed the emphasis on the logical aspects of the categorial doctrine. The categories are interpreted now not as "genera of being," that is, not as ὄντα but as φῶναι which signify ὄντα. What sort of ὄντα they signify, Porphyry did not specify. The ontological status of the *significata* was left an open question.<sup>31</sup> It could mean that Porphyry's ὄντα referred back to Aristotle's πρώτη οὐσία ("first substance"), in which case species and genera (the universals) would seem to be simple abstractions and empty names. But this line of thought would have to make Porphyry seem more an Aristotelian and less a Neoplatonist pupil of Plotinus. On the other hand, it could be that Porphyry's ὄντα pointed towards Plotinus' πρώτα γένη τοῦ ὄντος ("highest genera of being"), in which case the species and genera of which we speak as "universals" would again be almost empty names compared with the universals of universals (πρώτα γένη) of the Plotinian κόσμος νοήτος. The point is that the Neoplatonic split of the universal makes even Plato's ontological realism of the εἶδη seem like nominalism when compared to Plotinus' ontological realism of the πρώτα γένη. This somewhat strange nominalism may be called the Neoplatonic version of nominalism.

## V

By way of summarizing the thesis of this essay, it can be stated that the reasons for which Plotinus criticized so severely and rejected Aristotle's categories were strictly ontological and due to two facts: first, Plotinus had accepted the ontological interpretation of the Aristotelian categorial theory and drew from that the conclusions to which it leads logically; and secondly, Aristotle's ontology with its emphasis on the concrete individual (τόδε τι) and its restriction to the realm of phenomena, was in sharp contrast with reinforced Platonism of the Plotinian type that (1) places the emphasis not simply on the universal (Plato's εἶδος), but especially on the universal of universals (Plotinus' γένος), and (2) tends to go not only beyond the sensible realm (Aristotle), but also beyond the intelligible (Plato) towards the Absolute and Ineffable One.

The implications of Plotinus' ontological presuppositions are grave for the Aristotelian categorial doctrine and the Aristotelian logic in general. They certainly cannot be of great value to one who, like Plotinus, is concerned with the ἐπέκεινα ("beyond") and the really real conceived as ἕτερον ("other") than the sensible. For such a journey, neither the senses and the common sense nor logic in its syllogistic (Aristotelian) form or in its propositional (Stoic) form can be of much help. Another method is needed by which the ἀναγωγή ("lifting up") of the soul and its ἐπιστροφή ("return") to the Primordial Source can be accomplished. This method may be called "The Dialectic of Eros." But this is another story.

## Plotinus and Self-Predication

JOHN FIELDER

## I

Although there are problems of predication associated with the rather ordinary statement that Socrates is just, Platonists are faced with even more serious problems in the assertion that Justice (the Form) is just. This latter type of predication is a consequence of the relationship of forms and sensibles. Since Socrates is just by virtue of his participation in Justice, and Justice functions as a standard for judging whether one is just or not, it is natural to assert that Justice, too, is just. It would be rather odd to deny that Justice itself lacked justice.

However, since Justice and Socrates are radically different kinds of things, it seems equally odd to say that Justice is just in the same sense that Socrates is just. How can something incorporeal be just? or hot? or large? As R. E. Allen put it, no one can scratch Doghood behind the Ears or take a nap in the intelligible Bed.<sup>1</sup>

The assumption that "is just" means the same when applied to Socrates and to justice leads to immediately obvious absurdities. For a Platonist to hold such a theory of predication would require that he overlook or not recognize the absurd consequences of the theory. Since we can hardly credit Plato or Plotinus or any

other major philosopher with a mistake of this magnitude, we must assume that those men held some other more philosophically plausible theory concerning the meaning of "Justice is just."

A current proposal for a philosophically plausible theory of "Justice is just" is Pauline predication.<sup>2</sup> The idea is taken from Paul's discussion of charity in Corinthians. There he states that "charity suffers long and is kind . . . , rejoices with the truth and bears all things." Paul is not making an assertion about the abstract entity, charity. In that sense it would be absurd to speak of charity enduring anything. The grammar of Paul's statement suggests that he is speaking about charity, the abstract entity, but a moment's reflection shows that he is actually speaking about those individuals who have charity. It is they who endure all, not charity itself. Hence, what looks like a statement about an abstract entity is really a statement about a class of objects related to that entity, namely individuals sharing that characteristic.

If we apply this idea to "Justice is just," it becomes a way of saying that the individuals who participate in Justice are just. Instead of being an assertion about the Form, Justice, it is an assertion about the class of individuals who participate in Justice. Thus "Justice is just" regarded as an instance of Pauline predication means "Justice is such that whatever participates in Justice is just." Pauline predication thus avoid the difficulties attendant upon speaking of Forms and sensibles as being just in the same sense.

## II

The argument I have sketched above is a philosophical one, appealing not to texts but the philosophical intelligibility of theories of predication as it applies to Forms and sensibles. As such it applies to Plato and Neoplatonist alike insofar as they share the basic features of the theory of Forms. Further, this argument has two important methodological implications that bear on the textual inquiry necessary to determine whether Plato or Plotinus actually held either of these theories. First, the claim that Plotinus or any other major philosopher used the same sense of "is just" for Forms and sensibles will require much stronger evidence if this view is considered to be philosophically mistaken in an obvious way. One would have to submit overwhelming textual proof to back up the claim that a thinker of Plotinus' stature made such an obvious and fundamental mistake.

Second, the argument entails that any other philosophical doctrine that is based on applying the same predicate in the same sense to Forms and sensibles would also be philosophically incoherent and would require much more evidence to establish that Plotinus held it. This means that the copy theory, in order to be philosophically acceptable, could not be based on a view of likeness that involved the sharing of properties by forms and their corporeal images. Consequently, it is necessary to assess the soundness of this argument asserting the philosophical absurdity of one account of predication before examining our texts.

## III

The best statement of the view that an obvious absurdity results from applying the same predicates to forms and sensibles is in a recent article by Gregory Vlastos.<sup>3</sup> He is writing about Plato, but the argument, as I have shown, is a philosophical one and applies equally to Plotinus. Accordingly, I have taken the liberty of replacing references to Plato with references to Plotinus. Here is Vlastos's argument, which is the major consideration in favor of Pauline predication.

The most common use of the copula in Greek and English is "to indicate that the individual name by the subject-term is a member of the class of those possessing the attribute expressed by the predicate-term."<sup>4</sup> Thus "Socrates is wise" asserts that Socrates belongs to the class of wise individuals. Vlastos indicates this reading of "is" by the use of the letter epsilon: "Socrates  $\epsilon$  wise." Many true assertions about Forms have this character, for example, "Justice  $\epsilon$  incorporeal" or "Justice  $\epsilon$  intelligible." But if we treat the statements like "Justice is just," as epsilon predications we must attribute what Vlastos thinks is a stupendous philosophical error to Plotinus. For to assert that "Fire  $\epsilon$  hot" is to admit that Plotinus is guilty of

a piece of egregious nonsense: Heat is a property which only corporeal things could have. . . . We would be supposing that he wants to say in all seriousness that one of his incorporeal Forms has a corporeal property.<sup>6</sup>

In a similar fashion "Justice  $\epsilon$  just" would make the mistake of treating an abstract Form as if it had "a property which only concrete individuals—persons—and by legitimate extension, their actions, dispositions, institutions, laws, etc., could possibly have."<sup>7</sup> In both cases epsilon predication commits the categorial mistake of applying properties to the Form that could only be possessed by the Form's corporeal instances. Asserting that an incorporeal Form has a corporeal property is such an obvious absurdity we can hardly believe that Plotinus would allow it. Hence we cannot read statements like "Justice is just" as epsilon predications.

Vlastos appears to be making the following argument:

1. There are at least two types of properties, corporeal and incorporeal.
2. Corporeal subjects may only have corporeal properties.
3. Incorporeal subjects may have only incorporeal properties.
4. The assertion that an incorporeal subject may have a corporeal property or vice versa is philosophically absurd.
5. Justice is an incorporeal subject, a form.
6. To be "just" is a corporeal property.
7. "Justice is just" asserts that an incorporeal subject has a corporeal property.
8. Therefore, "Justice is just" is philosophically absurd.

I take this argument to be the substance of Vlastos's claims that "heat is a property which only corporeal things could have" and that it would be a philosophical

mistake to hold that "one of his incorporeal Forms has a corporeal property." Thus premises 1 and 2 embody Vlastos's distinction between corporeal and incorporeal subjects and properties; premise 3 states the requirement that statements must have the same type of subject and property; and premise 4 holds that violation of the requirement of premise 3 results in a philosophical mistake. In the remaining premises, these general principles are applied to the case of "Justice is just." It is clear that the argument can be applied to other similar assertions about Forms.

Premise 4 needs some further explanation as to why it is absurd to join subject and property of different types (i.e., corporeal and incorporeal). Again, Vlastos's argument is not explicit, but the idea seems to be that if an incorporeal subject (a Form) can have a corporeal property, then it is no longer possible to speak of it as an incorporeal subject. A corporeal subject must be made up of corporeal properties, otherwise the distinction between corporeal and incorporeal reality is undermined.

Vlastos concludes that epsilon predication contains an obvious philosophical mistake, one that a major philosopher could hardly be expected to make. Hence we have strong reasons for supposing that statements like "Justice is just" are Pauline predications.

Vlastos is certainly correct in pointing out that epsilon predication, as he has presented it, leads to clear absurdities. But this only proves that *his version* of Pauline predication involves an obvious philosophical mistake. Vlastos seems to assume that there is only one way to develop a theory of epsilon predication and that, therefore, it can be eliminated as a serious philosophical theory by his argument. But this is hardly plausible: there are a number of different versions of Pauline predication, and one would certainly think that there may be more than one conception of epsilon predication as well.

I suspect that if Vlastos and Allen were more familiar with Neoplatonic thought, they would not be so hasty in rejecting epsilon predication. Plotinus approaches a number of philosophical problems of the Theory of Forms from a different direction and provides philosophical solutions not found in Plato. It is not surprising, therefore, that Plotinus' view of "justice is just" and similar statements about forms utilizes a version of epsilon predication that is not subject to the difficulties inherent in Vlastos's account.

#### IV

The best way to approach Plotinus' understanding of statements about Forms is to begin with "Socrates is just" and see how it is related to "Justice is just." As Vlastos suggests, the former type of assertion is regarded by Plotinus as an instance of epsilon predication. That is, the subject is said to possess the property expressed by the predicate. Thus "white and black are predicated of an object having one or other of these qualities . . . , knowledge is predicated of the subject in whom knowledge exists" (VI. 3. 4). And, in fact, the sensible subject is regarded by Plotinus as a collection of these properties in matter.<sup>6</sup> In VI. 3. 8., at the end of a discussion of sensible substance, he concludes that sensible substance

is a "coagulation of qualities and Matter; all the qualities taken together as coagulating in a uniform matter constitute [sensible] substance." Accidental properties are part of the collection but they "take independent rank and are not submerged in the mixture."

It might be supposed that it is necessary to distinguish the particular, individual property as found in a subject from the universal characteristic it shares with other subjects. Thus we would distinguish the particular "white" of this portion of milk from the whiteness it shares with other white things. But Plotinus does not make such a distinction, at least not in a way that results in two different entities, the universal and the particular individual features of a subject. Rather, for Plotinus, the particular property functions as a universal.<sup>7</sup> The particular white of this portion of milk is one and the same white that is found in a different portion of milk.

The whiteness in a portion of milk is not a part of the whiteness of milk in general: we have the whiteness of a portion, not a portion of whiteness; for whiteness is utterly without magnitude; has nothing whatever to do with quantity (IV.3.2).

And similarly for grammar:

Grammar is not posterior to the particular grammar: on the contrary, the grammar as in you depends upon the prior existence of grammar as such: the grammar as in you becomes particular by being in you; it is otherwise identical to grammar the universal (VI.3.9).

It is a philosophical error, Plotinus holds, to separate the particular white of a subject from whiteness, the universal. We make such an error because we treat the particular property like a sensible object. The portion of milk clearly cannot be in many places at once without being divided, but its white color can, because it is "utterly without magnitude." The bundle of properties that comprise the portion of milk are without matter, for they "coagulate in a uniform Matter." It (the property) is not a corporeal individual and, therefore, is capable of being completely present throughout a number of sensible objects.

Hence when we predicate "is white" of a member of sensible subjects, the predicate picks out a single property that is identically and wholly present in those subjects. This capacity to be wholly present throughout a number of different individuals is characteristic of intelligible reality. The properties that make up sensible objects are intelligible existents and sensibles acquire them through participation.

It is not Socrates who bestows manhood upon what was previously not Man, but Man upon Socrates; the individual man exists by participation in the universal (VI.3.9).

Participation is simply the act by which intelligible existents enter matter and provide some characteristic to the sensible subject.

The intelligible existent that enters matter is Soul. After speaking of the capacity to be present in many without partition, Plotinus remarks that:

To have penetrated this idea is to know the greatness of Soul and its power, the divinity and wonder of its being, as a nature transcending the sphere of things (VI.2.1).

And in the two treatises devoted to the integral omnipresence of authentic existence, Plotinus begins with the question, "How are we to explain the omnipresence of Soul?" (VI. 4. 1).

We appear, then, to have three levels of reality and two intelligible existents. The three levels are sensible, Soul, and Form (in *Nous*). There are only two intelligibles, since Soul is in Sensibles. But this appearance is somewhat misleading. As a number of Plotinian scholars have pointed out, the distinction between *Nous* and Soul tends to disappear.<sup>10</sup> Soul, for example, possesses no material principle to differentiate it from *Nous*. Both *Nous* and the sensible world are made distinct from their previous hypostases by principles of matter. John Deck points out that Plotinus argues for the direct participation of sensibles in *Nous*, making Soul an unnecessary hypostasis.<sup>11</sup> Deck concludes that "the sensible world, as being, is *Nous*."<sup>12</sup> R. T. Wallis has developed a similar view of the relation of *Nous* and Soul.<sup>13</sup> My own view is that Soul should be regarded as *Nous* in its function of generating a sensible world. It is its role that may be distinguished rather than viewing Soul as a separate hypostasis. Just as Plotinus found reason to collapse the distinction between the particular property and the universal, so also he was driven to assimilate Soul to *Nous*.

It is reasonable to believe that instead of three levels and two intelligible existents, the true Plotinian view of the relationship of Form and sensibles is that there are two levels, *Nous* and the sensible world, and only one intelligible reality, *Nous*. Soul is simply the *Nous* in its role of permeating matter, generating the sensible world. Instead of an additional hypostasis, Soul is simply one aspect of *Nous*.

The result of this for the problem of predication is profound. For it entails that the properties that make up sensible existents are the Forms themselves. They are the intelligible existents that are present in Matter, and in which sensibles participate.

## V

When we say that Socrates is just, we are claiming that the Form of Justice is immanent in Socrates, according to Plotinus. The justice in Socrates is Justice itself, present in Matter. As a consequence, predicating "is just" of Socrates is not so greatly different from predicating "is just" of the Form itself. In both cases the predicate asserts the presence of Justice in the subject. In the case of Socrates, Justice is immanent in the Matter that constitutes the subject, Socrates. In the case of justice itself, what the predicate signifies is the entire subject, not just part of the subject, as in the case of Socrates. Although there are important differences in the two propositions that "justice is just" and "Socrates is just," the predicate has the same meaning.

Regardless of the philosophical merit of Plotinus' theory of predication, two points are clear. First, it is a theory based on epsilon predication rather than Pauline predication. Second, whatever the difficulties this theory generates, it is not obviously absurd. It cannot be disqualified as unworthy of a major thinker or as so incoherent that significantly more evidence is needed to establish it as Plotinus' view. Rather than being a philosophical liability, as Vlastos and others think, epsilon predication provides a coherent account of how predicates are applied to Forms and Sensibles. And it does so in a way that reinforces a number of central Platonic themes (the copy theory, participation, and the role of Forms as Epistemological standards), all of which present serious problems for Pauline predication.

# Omnipresence, Participation, and Eidetic Causation in Plotinus

JONATHAN SCOTT LEE

Émile Bréhier has written that "fourth and fifth treatises of the sixth *Ennead* . . . can easily be read without any reference to Greek philosophy."<sup>1</sup> In this paper I shall argue, to the contrary, that the philosophical import of these treatises on "The Integral Omnipresence of Being" can only be determined in the context of the Greek metaphysical tradition. In particular, I want to argue that in these treatises, Plotinus' central concern is the notoriously elusive concept at the heart of metaphysical Platonism, the concept of participation. This can be shown by reference to two major problems with which Plotinus deals in VI.4–5. 22–23.<sup>2</sup>

## I

The first problem (and this is the problem that, in effect, sets the entire argument of the treatises into motion) derives from *Parmenides* 130e4–131c11. Here, Plato (in the persona of the pre-Socratic philosopher Parmenides) raises a pair of objections against the notion of participation. These objections center around a conception of participation as the relation between my given *eidos* and the multiplicity of

sensible particulars that participate in that *eidos*. Because of the importance of this Platonic text to the argument of VI.4–5, it will be useful to cite Parmenides' objections more fully:

"Then, is it the case that each thing participating participates in either the whole of the *eidos* or in a part of it? Or might there be some other mode of participation besides these?"

"How could there be?" he said.

"Does it seem to you, then, that the *eidos* as a whole, being one, is in each of the many, or how?"

"What hinders this, Parmenides?" said Socrates.

"Then, a thing that is one and the same would be at the same time, as a whole, in many things which are separate, and hence it would be separate from itself" (131a4–b2).

Parmenides leads the young Socrates on to consider the second alternative presented at 131a4–5: that each thing participating participates only in a part of the *eidos*. The argument then resumes:

"Then, Socrates," he said, "the *eide* themselves would be divisible, and the things participating in them would participate in a part. No longer would an *eidos* be in each as a whole; rather, a part of each *eidos* would be in each."

"So it seems."

"Then, would you be willing, Socrates, to say to us that in truth the one *eidos* is divided and yet that it is one?"

"Certainly not," he said (131c–11).

These objections take the form of a dilemma: either the *eidos* as a whole is in each of the many sensible particulars that participate in it, in which case the *eidos* will be separate from itself, or else only a part of the *eidos* is in each of the sensible particulars, in which case the *eidos* will be divided and, hence, not one.

Now, in the *Parmenides* Socrates suggests a way in which this dilemma can be avoided and the many sensible particulars can be said to participate in an *eidos* as a whole. This suggestion is put in terms of a metaphor at 131b3–6:

[The *eidos* would not be separate from itself] if it were like one and the same day [ἡμέρα], which is in many places at the same time and yet is in no way separate from itself, if each of the *eide* is in all [the things participating in it] at the same time as one and the same thing in this way.

Socrates' suggestion is not pursued in the *Parmenides*; rather, Parmenides distorts it into the clearly materialistic analogy of a sail spread over a number of people, an analogy that sets up Parmenides' presentation of the second half of the dilemma (quoted above). However, the analogy of the day accomplishes two quite important things even within the context of Plato's dialogue. In the first place, Socrates' suggestion opens up the possibility of an escape from the Parmenidean dilemma, an escape involving the acceptance of the first horn of the dilemma together with a denial of the apparent consequence that each *eidos* will be separate from itself. In the second place, the fact that the analogy of the day appears to offer an escape

from the dilemma casts doubt on Parmenides' assumption that the relation between *eide* and sensible particulars is like the ordinary relation between a whole and its parts. Such a conception of the whole/part relation seems to be quite appropriate in the context of material objects, that is, the sensible particulars that occupy space. However, it appears to lose its usefulness in the context of non-material things such as the Platonic *eide*. This latter point is made doubly apparent by Parmenides' inability to deal in any effective way with the analogy of the day (compare 131b7–c4) and by his grotesque illustration of the dilemma discussed above in terms of a crude, materialistic analysis of the *eide* of largeness, equality, and smallness at 131c12–e7. The analogy of the day, thus, provides a means by which the relation between nonmaterial entities like the *eide* and material or sensible particulars can be conceived. In successfully accomplishing this, the analogy, in effect, challenges the propriety of an ordinary conception of the relation between wholes and parts in the context of a treatment of participation.

As will soon become apparent, Plotinus' response to the objections of *Parmenides* 130e4–131c11 is very much in the spirit of Socrates' analogy of the day: the Plotinian escape from the dilemma involves the acceptance of its first horn together with a denial of the apparent consequence that each *eidos* will be separate from itself. Of course, Plato's discussion concerns the relation between individual *eide* and their participants in the sensible world, while Plotinus' discussion concerns the relation between the intelligible world as a whole (τὸ ὅν) and the sensible world. However, this difference is merely one of emphasis, since the characterization of the participation relation with respect to one *eidos* ought to be applicable to that relation with respect to all *eide* (i.e., to the intelligible world as a whole).

Plotinus offers three separate, but fundamentally similar, direct responses to the dilemma posed in the *Parmenides*; these occur at VI.4.8.2–45, VI.4.13.6–26, and VI.5.3.1–21. For the purposes of this discussion, I shall concentrate on the last of these because it is here that Plotinus' argument is most fully elaborated.

The argument of VI.5.3 rests on a rather Aristotelian preliminary discussion of philosophical methodology in VI.5.2. Plotinus here claims that the materialists (like the Parmenides of Plato's dialogue) fail to be persuaded of the truth of the nonmaterialistic metaphysics of Platonism "because they have not made a start of their inquiry from appropriate principles" (VI.5.2.5–6).<sup>3</sup> In discussing the intelligible world and its relation to the sensible world, Plotinus insists that "... it is necessary for us to take principles appropriate for proof to the account of the One which exists everywhere; and, since this account is of intelligibles, it is necessary for us to take principles of the intelligibles closely linked with true Being" (VI.5.2.7–9). This advice already contains the kernel of Plotinus' response to Parmenides: the intelligible world must be regarded as "the One which exists everywhere," that is, as the One which is omnipresent to the sensible world. The omnipresence of the intelligible world, however, will be proved (after a fashion) by Plotinus in VI.5.3, on the basis of an accurate description of the basic features of the intelligible world and the sensible world. Hence, the intelligible world's omni-

presence is not just a matter of definition; rather, it is a logical consequence of the nature of being.

Plotinus goes on to outline the basic features of the sensible and the intelligible worlds, obviously taking this general description to provide the relevant "appropriate principles" for metaphysical inquiry:

Now, on the one hand, there is that which is in motion, which undergoes every sort of change, and which is distributed in every place; this, indeed, might best be named Becoming, rather than Being. On the other hand, there is that which always is, existing always in the same way, which neither comes into being nor perishes, which occupies no region of space, neither a place nor some base [τινα ἐδραν], which neither goes out from some place nor again enters into another, but which remains in itself (VI.5.2.9–16).<sup>4</sup>

Armed with this general description of the sensible world and the intelligible world, which description he takes to be an adequate account of the "essences" of the two worlds (compare VI.5.2.19–28), Plotinus is prepared to tackle the Parmenidean dilemma.

He begins, in effect, by considering the second half of the dilemma—that only a part of an *eidos* is in each of the sensible particulars participating in that *eidos*—and argues that this possibility is ruled out by the essential nature of the intelligible world. He writes:

If, then, our subject is true Being, which (as was said) exists always in the same way, which does not go forth from itself, which is not in any relation of coming-to-be, and which is not in place, it is obviously necessary that it, being thus, always be with itself, that it be not divided from itself, that it be not part here and part there, and that it not give up anything from itself. For, otherwise, it would be in one thing and another thing (things different from itself), and in general it would be in something else, rather than being in itself and impassible (for if it were in something other than itself, it would be affected). But, if it is in an impassible condition [as was said], then it is not in anything other than itself (VI.5.3.1–8).

In other words, Plotinus argues that the division of a Platonic intelligible world (or of a single *eidos*) into parts is inconsistent with the essential character of Being, as described in VI.5.2. In the context of the Parmenidean dilemma, Plotinus is in effect arguing that the participation of sensible particulars in *eide* cannot be understood as participation in parts of *eide*, since such an analysis requires that the *eide* be divided into parts and, thus, modified by their relation to the sensible world, which view is in conflict with the impassible or immutable nature of the intelligible world. Hence, participation cannot be explained in terms of the apportionment of parts of the intelligible world to sensible particulars. It follows that participation involves the relation between sensible particulars and each *eidos* as an integral whole or, more generally, that the sensible world is related to the intelligible world as an integral whole. This, of course, forces Plotinus into the consideration of the first half of the Parmenidean dilemma—that an *eidos* as a whole is in each of the sensible particulars that participate in that *eidos* and is, thus, separate from itself.

Plotinus' response to the first half of Parmenides' dilemma is somewhat more obscure than the argument quoted above and will require some effort to reconstruct. At VI.5.3.8–14, immediately following the preceding passage, Plotinus writes:

Therefore, if Being does not separate from itself, if it has not been divided into parts, and if it changes itself in no way whatever, and, furthermore, if it is to be in many things at the same time as a single whole while remaining in itself, its being in many things must involve the existence of the same thing everywhere; that is, it is both in itself and yet not in itself. Hence, all that can be said is that, on the one hand, Being is in nothing at all, and, on the other hand, the things other than Being participate in it. . . .

In the light of this Plotinus concludes:

Hence, either it is necessary to reject our hypotheses and principles, saying that there exists no nature such as that described, or else, if such a rejection is impossible, then such a nature—Being—must necessarily exist, and we must admit the position maintained at the beginning [cf., VI. 4. 1–3]: Being is one and the same in number, not having been divided into parts but, rather, existing as a whole and being remote from no one of the things other than it (VI.5.3.15–21).

Now, the argument embedded in these passages can be reconstructed as follows:<sup>2</sup> Given the nature of the Platonic intelligible world previously sketched, this world cannot be divided into parts in order to account for participation. Such a division would be inconsistent with this world's essential character. Hence, the intelligible world must remain an integral whole. Given this Plotinian account of the intelligible world, *Parmenides* 131a4–b2 appears to draw the absurd consequence that the intelligible world, if it is participated in by sensible particulars, becomes separate from itself because it then exists as an integral whole "in many things which are separate." Such a consequence appears to entail the impossibility of participation and, thus, the untenability of metaphysical Platonism. Plotinus' response to this objection is simply to deny the derivation of the Parmenidean consequence: if the intelligible world has the essential nature attributed to it in VI.5.2, then it must always remain an integral whole (VI.5.3.1–8); if participation is to be possible (as it must be, given the observed fact of the existence of sensible particulars), then the intelligible world must (somehow) "be in many things at the same time as a single whole while remaining in itself" (line 10); since this involves "the existence of the same thing [namely, Being or the intelligible world] everywhere" (lines 10–11), participation requires the omnipresence of Being as an integral whole, that is, the integral omnipresence of Being. In effect, Plotinus is arguing that the objection at *Parmenides* 131a4–b2 stems from Parmenides' failure to understand the essential nature of Being, his failure to understand that Being is such as to be integrally omnipresent to the sensible world if it is present to it at all.

It is not perhaps entirely clear how VI.5.3 serves as an *argued* response to *Parmenides*. *Parmenides* 131a4–b2 purports to offer an argument to the effect that the claim that the intelligible world as a whole is involved in the participation of diverse sensible particulars in Being entails the absurdity that the intelligible world

is separate from itself. Plotinus clearly denies the propriety of deriving this absurd consequence from the Platonic theory (i.e., from his formulation of this theory); however, he appears to provide no argument for this denial. Now, as I suggested above, the main point of Plotinus' response to Parmenides seems to be that the Parmenidean objection draws its force from a failure to understand the essential nature of the intelligible world. Plotinus is arguing, in effect, that once one understands the essence of the intelligible world as an integral whole, one is forced to the conclusion that participation requires the integral omnipresence of this whole to the sensible world, even though this omnipresence cannot be adequately formulated in terms of our ordinary conception of the relation between wholes and parts. I am suggesting, then, that Plotinus is here acting on "the principle that the best defense is attack"<sup>3</sup> and that this is a reasonable procedure for dealing with the Parmenidean dilemma (assuming, of course, that some sense can be made of the Plotinian conception of the intelligible world as integrally omnipresent to the sensible world). In his article, "Universals and Metaphysical Realism," Alan Donagan (in defense of a form of realism) advocates this very response to a slight variant of *Parmenides* 130e4–131c11. He writes:

To say that [a universal] is "entire and yet divided from itself" is objectionable, because it presupposes that to be exemplified in two different places at once implies being divided. It is true that a *particular* can only be in two places at once if one part of it is at one place, and another part at the other; but, by their very nature, universals are not divisible into parts.<sup>4</sup>

The moral of Plotinus' argument is obvious: Parmenides' analysis of the intelligible world in its relation to the sensible world—an analysis centrally involving our ordinary conception of the whole/part relation—must be supplanted by a new analysis, an analysis that embodies the fact that Being is indivisible and, thus, must remain an integral whole in its relation to the sensible world. In effect, Plotinus is arguing that the consequences derived from Parmenides' analysis of the intelligible world are at odds with brute metaphysical fact, namely, the essential nature of the intelligible world as an integral whole omnipresent to the sensible world. Hence, Parmenides' understanding of the intelligible world is simply in error, and his method of dealing with problems concerning the intelligible in its relation to the sensible is inappropriate. In the light of this fact, Plotinus argues, the objections of *Parmenides* 130e4–131c11 lose their force.

Regardless of the ultimate success of his response to Parmenides, it is surely clear that Plotinus is, in VI. 4–5, offering his own essentially Platonic solution to these objections drawn from the text of Plato; he is attempting to develop a technical account of the relation between the intelligible and the sensible that is immune to the objections posed in the *Parmenides*.

## II

A second major problem that Plotinus faces in VI.4–5 again arises quite simply from the metaphysical tradition of Platonism. At *Phaedo* 100c4–d8, the relation between the *eide* and things in the sensible world is described in an account of

causality (αἰτία), and by implication the *eide* are described as the (possibly unique) *causes* (τὰ αἰτία) of particulars in the sensible world. In other words, Plato here suggests that the problem of participation is to be resolved by the elaboration of a theory of what I shall call "eidetic causation," that is, a theory of the way in which the *eide* that make up the intelligible world of Being are the causes of sensible particulars.

This suggestion that a theory of eidetic causation is central to Platonic metaphysics leads to one of Aristotle's most telling objections against metaphysical Platonism. At *Metaphysics* A. 9. 991a8–11 (compare M. 5. 1079b12–15), he writes:

Above all one might discuss the question, what on earth the *eide* contribute to sensible things, either to those that are eternal or to those that come into being and cease to be. For they cause neither movement nor any change in them.<sup>8</sup>

This charge that the *eide* cannot be the causes of change in the sensible world is repeated and elaborated at *De generatione et corruptione* B. 9. 335b18–21, where Aristotle attacks the theory adumbrated in the *Phaedo* that the *eide* are the causes of the particulars that make up the sensible world. Here, he writes:

If the *eide* are causes [αἰτία], why do they not always generate continually but only intermittently, since the *eide* and the things participating in them are always there?<sup>9</sup>

In other words, Aristotle's argument is designed to show that a Platonic account of the sensible world in terms of eidetic causation alone cannot adequately explain the ubiquitous phenomenon of change in the sensible world.

In Section I of this paper I argued that Plotinus in *Ennead* VI.4–5 is attempting to develop a solution to the problem of participation and that this solution involves the doctrine of the integral omnipresence of the intelligible world to the sensible world. This doctrine is, in effect, the fundamental feature of Plotinus' theory of eidetic causation. However, the claim that eidetic causation is to be elucidated along Plotinian lines in terms of the integral omnipresence of Being raises an obvious question, a question very much in the spirit of the Aristotelian objection to Platonism introduced above: how is it that not all *eide* are manifested at all points in sensible space (or matter) at all times? In other words, how is it that, say, the *eidos* of man, though integrally omnipresent to the sensible world, is only seen to be present in certain regions of space (where people exist) and not in others (e.g., where rocks exist)? There appears to be a serious tension between the integral omnipresence of the intelligible world and its intermittent causal efficacy. In this section, I shall (1) elaborate a key strand of Plotinus' account of eidetic causation and (2) use this account to sketch a Plotinian answer to Aristotle's objection concerning the intermittent causal efficacy of the *eide*.

1. Plotinus devotes much of VI.5 to an explanation of the dynamic of eidetic causation, that is, to an explanation of *how* the intelligible is omnipresent to the sensible in such a way that the sensible world appears as it does. The heart of this explanation (see, in particular, VI.5.7. passim; 9.1–31; and 12.1–31) lies in the doctrine that *psyche* is an intermediary between the intelligible world and the

sensible world (a doctrine derived from *Timaeus* 35a1–8). It is *psyche*, present to the sensible world "as one life" (VI.5.12.1), that is the productive cause (τὸ αἰτιον, τὸ ποιοῦν) of the sensible world (VI.5.9.1–13).

The key to understanding the role of *psyche* in Plotinus' conception of eidetic causation is the doctrine of productive contemplation, a doctrine that is developed at some length in *Ennead* III.8[30], "On Nature and Contemplation and the One," a treatise written shortly after VI.4–5. The doctrine is simply that contemplation (θεωρία) is in some way to be understood as productive, that is, that contemplation involves production or making (ποίησις). The Plotinian claim that I will try to elucidate is that *psyche*, and in particular the *psyche* that Plotinus calls "Nature," exercises a form of contemplation that produces (i.e., causally brings into existence) the sensible particulars that make up the sensible world. In passing, I might mention that this doctrine of productive contemplation seems to mark one of Plotinus' most original achievements, since it appears to run counter to the traditional Greek conception of contemplation as something opposed to both production and action (πρᾶξις).<sup>10</sup> This traditional conception is, of course, that of Aristotle, who contrasts contemplation with action at *Nicomachean Ethics* X.7, by maintaining that "nothing comes from contemplation except the contemplating, but from practical activities we acquire more or less apart from the action" (1177b 2–4). If Plotinus is right, what we gain from (a kind of) contemplation is nothing less than the whole of the sensible world.

What, then, is involved in Plotinus' doctrine of productive contemplation? There appear to be basically two interrelated theses here. In the first is the claim that contemplation is productive or, as Plotinus prefers to put it, that production *is* contemplation. This comes out at III.8.3.20–23, where he writes:

So Nature's making has been revealed to us as contemplation, for it is a result of contemplation, and the contemplation stays unchanged and does not do anything else but makes by being contemplation.<sup>11</sup>

The second thesis involved in Plotinus' account of productive contemplation is that the whole of the sensible world "comes from" the contemplation exercised by the particular *psyche* which is Nature and, thus, that *psyche* (i.e., Nature) is the cause of the sensible world, by virtue of its act of contemplation. This aspect of the doctrine of productive contemplation is brought out at III.8.7.1–4:

That all things come from contemplation and are contemplation [at least in the sense of "being contemplated"], both the things which truly exist [i.e., the *eide* and the *psychai*] and the things which come from them when they contemplate and are themselves objects of contemplation, some by sense perception and some by knowledge or opinion [is clear].

Thus, what the *psyche*'s (i.e., Nature's) productive contemplation is productive of is, for Plotinus, the whole of the sensible world.

In chapter 4 of III.8, Plotinus asks Nature to explain her contemplative production of the sensible world, which she does by means of an analogy:

My act of contemplation makes an object of contemplation, as the geometers draw their figures while they contemplate. But I do not draw; rather, as I contemplate, the lines which bound bodies come to be as if they fell from my contemplation (III.8.4.7–10).

Although the apparent allusion to Plato's account of the construction of the regular solids at *Timaeus* 53c4–55c6 here is intriguing,<sup>12</sup> Nature's words leave me quite mystified: the production of the sensible world (in this case, of "the lines which bound bodies") just seems to happen as a result of Nature's contemplation. The details of the account are lacking, and the result is quite unsatisfactory from a philosophical point of view. What is clear here is that Nature's act of contemplation produces an object of contemplation, a *θεώρημα*, which *theorem* is the sensible world.

Plotinus follows up this statement from Nature with the following difficult, but illuminating, analysis:

What does this mean? That what is called Nature is a *psyche*, the offspring of a prior *psyche* with a stronger life; that it quietly holds contemplation in itself, not directed upwards or even downwards, but at rest in what it is, in its own repose and a kind of self-perception [or "self-consciousness," *συναίσθησις*], and in this consciousness and self-perception it sees what comes after it, as far as it can, and seeks no longer, but has accomplished a vision [*θεώρημα*] of splendour and delight (III.8.4.15–22).

This passage introduces the notion of self-consciousness (*συναίσθησις*) into the account of productive contemplation: the contemplation that is productive of the sensible world is a contemplation involving a *psyche*'s consciousness of itself. Nevertheless, the central question remains: How is this contemplative self-consciousness productive of the sensible world?

As a step towards the understanding and reconstruction of the doctrine of productive contemplation, it will prove useful to consider Plotinus' conception of the *psyche* in the light of the distinctively Neoplatonic interpretation of Plato's *Parmenides*. According to the Neoplatonic reading of the second half of the *Parmenides*, each of the first five (affirmative) hypotheses corresponds to and is descriptive of a particular level of reality. The third hypothesis, *Parmenides* 155e4–157b5, which is described as a "corollary on becoming in time" rather than as an independent hypothesis by F. M. Cornford,<sup>13</sup> deals with the metaphysical level of *psyche*, according to the Neoplatonic interpretation of Plato. While dealing with *psyche*, the third hypothesis serves as a sort of synthesis of the negative conclusions of the first hypothesis and the parallel positive conclusions of the second hypothesis. Thus, the *psyche* is conceived as an entity that somehow, in its nature, reconciles the negations of the first hypothesis with the affirmations of the second.<sup>14</sup>

However, since the *psyche* cannot be, for example, both at rest and in motion at the same time, the *psyche*'s reconciliation of such opposites must be spread out over time, from which comes the derivation of time at the level of *psyche* for the Neoplatonists (compare *Ennead* III.7[45].11, discussed later in this section). Moreover, the actual passage in the *psyche* from rest to motion cannot take place

at a particular time, since the *psyche* cannot be in both of two such contrary states at the same time; rather, this passage or change takes place in what Plato calls "the instant [*τὸ ἐξαιφνης*]," an "absurd thing" that occupies no time at all (see the *Parmenides* 156d1–e3). Thus, the *psyche*'s essential activity—which, in effect, amounts to the reconciliation of the opposite conclusions of the first two hypotheses of the *Parmenides*—occupies no time at all, though the possibility of this reconciliation presupposes the continued existence of the *psyche* over time. Moreover, the *psyche* is in a sense pure negativity since (at least in the course of its essential mediating activity) it is neither, for example, at rest nor in motion (nor is it any one of any pair of such contraries). Rather, the *psyche* makes the transition from rest to motion possible (and from any other state to its opposite), by providing a neutral point, the instant, at which this transition can take place. Hence, the Neoplatonic interpretation of the third hypothesis of the *Parmenides* reveals the *psyche* to be in itself a locus of pure negativity.<sup>15</sup>

Given this analysis of the *psyche* as pure negativity, I think that the doctrine of productive contemplation may begin to make some sense. We must begin by considering what it is that Nature contemplates when it contemplatively produces the sensible world. The previous quotation cited from III.8.4 suggests that Nature's object here is simply Nature itself as a *psyche*, since Nature is said to be "at rest in what it is, in its own repose and a kind of self-consciousness" (lines 18–19); however, we must not be led to think that Nature's object is itself pure negativity. Rather, its object is itself reflecting the intelligible world of *eide* in *logoi* (or psychical representations) because Nature "stays unmoved as it makes, and stays in itself, and is a *logos*" (III.8.3.2–3). In short, the object of Nature's (*psyche*'s) self-consciousness is really the intelligible world as reflected in Nature (*psyche*) (compare VI.5.9.23–48).

The question now arises: Where does the negativity of *psyche* come in? I suggest that the negativity of *psyche*, for Plotinus, consists in the negativity of self-consciousness, which sets itself over against the *eide* as something separate and distinct. As something distinct from Being, of course, self-consciousness must set itself up as (quite literally) nonbeing. Prior to the exercise of self-conscious contemplation, the *psyche* was in noetic identity with the intelligible world; however, once the *self* is added to the objects of *psyche*'s contemplation, the *psyche* itself becomes more of a nonentity. This is made quite clear at VI.5.12.19–22, where Plotinus writes:

Formerly, you were the All [i.e., the intelligible world]. But, because you added something different to the All, you made yourself a lesser thing by this addition. For the addition was not from the All—you can add nothing to that—but from nonbeing.

(Note the use of the second person in this passage, which helps to emphasize the fact that the issue at hand here is self-conscious contemplation.) In passing, it is worthy of note that the *psyche*'s interest in itself, its contemplative self-consciousness, is the source of the *psyche*'s moral evil according to Plotinus. This interest in self makes the *psyche* "a lesser thing," that is, a morally deficient being. The moral quality of self-consciousness is made strikingly clear at the

beginning of the treatise "On the Three Primary Hypostases," V.1[10].1.3–5, where Plotinus writes:

Thus, the beginning of evil for individual *psychai* is their audacity [τόλμα], their generation, their first difference, and their desire to be self-centered.

But, now, how does this doctrine of self-consciousness explain the contemplative production of the sensible world? I suggest that this is accomplished in the following way. When ■ *psyche* self-consciously contemplates (or, as in the present case, when Nature self-consciously contemplates) an *eidos* (for example, that of oak tree), what it is actually contemplating is that *eidos* as reflected in some *logos* or psychical representation. In other words, the *psyche* (i.e., Nature) is contemplating a *logos*, which is at once both a reflection of the *eidos* of oak tree and an aspect of the *psyche* itself, since each *psyche* is a "sum of *logoi*" (VI.2[43].5.12). The self-consciousness of the *psyche*—by virtue of its desire to be self-centered, its desire to emphasize itself as a locus of pure negativity—sets its *logos* of oak tree over against the *eidos* of oak tree, attempting to set this *logos* up as something separate and distinct from the *eidos*. It is this *logos* of oak tree, made to seem separate and distinct from its *eidos* by the power of *psyche*'s (i.e., Nature's) negativity, that we call an oak tree in the sensible world. It is Nature's similar treatment of its *logoi* of other *eide* that leads to the production of the whole of the sensible world, with all of that world's complexity, all of its "splendour and delight."<sup>16</sup>

2. On the basis of the preceding analysis of *psyche*'s central role in Plotinus' theory of eidetic causation, we are now in ■ position to sketch a Plotinian solution to Aristotle's objection concerning the intermittent causal efficacy of the *eide*. That *psyche* which Plotinus calls "Nature" effects the (omni-)presence of the intelligible world to the sensible world through its exercise of productive contemplation. One of the salient features of this contemplative activity is that it is discursive; that is, it involves a successive sort of understanding that can take place only in time. The essentially temporal character of *psyche*'s discursive contemplation is brought out in the Neoplatonic interpretation of the third hypothesis of the *Parmenides* as description of the metaphysical level occupied by *psyche*. If the *psyche* is (in its essential nature) the locus of the reconciliation of such opposites as motion and rest, and if such a reconciliation can occur only over a period of time, then it seems clear that the *psyche* must exist and act in time, at least to the extent that it is involved in some form of nonnoetic (and distinctively psychical) contemplation.<sup>17</sup> Indeed, as Plotinus makes clear in his important treatise "On Eternity and Time" (III.7[45]), time owes its derivation to the discursive character of *psyche*'s essential activity (its "life"). At III.7.11.27–45, Plotinus develops his theory of the psychical nature of time (a theory designed to incorporate the view of *Timaeus* 37d5–7 that time is "an everlasting image moving according to number" of eternity) as follows:

... *psyche*, making the sensible world in imitation of that other world, moving with a motion which is not that which exists there, but like it, and intending to be an image of it, first of all put itself into time, which it made instead of eternity, and then handed over that which came into being as ■ slave to time, by making

the whole of it exist in time and encompassing all its ways with time. . . . For as *psyche* presents one activity after another, and then again another in ordered succession, it produces the succession along with activity. . . . So the spreading out of life involves time; life's continual progress involves continuity of time, and life which is past involves past time. So would it be sense to say that time is the life of *psyche* in a movement of passage from one way of life to another? [Yes].<sup>18</sup>

When it is recalled that, at VI.5.12.1, Plotinus answers the question, "How is Being present to the sensible world [πάρεστιν οὖν πῶς]?, with the three words, "As one life [ὡς ζωὴ μία], it becomes clear that the temporal character of the *psyche*'s (Nature's) nonnoetic discursive contemplation (which is productive of the sensible world) must play some role in the Plotinian theory of eidetic causation. This role is indicated by Plotinus at VI.5.11.15–16, where time is described as "being dispersed always toward separation [τοῦ μὲν σκιδναμένου ἀεὶ πρὸς διάστασιν]."<sup>19</sup> Hence, we may expect the temporal character of the *psyche*'s productive contemplation to figure in the Plotinian explanation (by eidetic causation) of the separation and disjointedness that are characteristic of the sensible world.

In fact, the discursive and, thus, temporal character of productive contemplation provides a solution to Aristotle's problem of the intermittent causal efficacy of the *eide*. If the *psyche* engaged in self-conscious, nonnoetic, discursive contemplation is continually redirecting its contemplative attention towards different *eide*, then the *logoi* derived from this contemplation and the particulars constituting the sensible world (which simply are these *logoi* set up as separate and distinct by the *psyche*'s self-consciousness) will be continually coming into being and passing away. This has the effect that only certain *eide* can be said to be fully present to the sensible world at any given time since only certain *eide* are the objects of Nature's productive contemplation at that time. Thus, each *eidos*'s causal efficacy vis-à-vis the sensible world is not continuous but intermittent because the *psyche*'s productive contemplation is the central link in the chain of eidetic causation.

In the preceding account, I have ignored an alternative theory accounting for the intermittent character of eidetic causation which appears to play a major role in VI.4–5 (e.g., VI.4.3.11–23; 11.3–14; VI.5.8.1–39). This alternative theory seems to attribute to matter a role in the causation of the sensible world, and the intermittent character of eidetic causation is explained by reference to the doctrine of "reception according to the capacity of the recipient." Since this theory appears to be in blatant contradiction to the thesis of the impassibility of matter (argued at great length at III.6[26].6–19), I think the theory sketched in this paper must be regarded as more representative of Plotinus, as well as being more satisfactory from a philosophical point of view.<sup>20</sup>

### III

At the beginning of this paper, I quoted Émile Bréhier as saying that the "fourth and fifth treatises of the sixth *Ennead* . . . can easily be read without any reference to Greek philosophy."<sup>21</sup> I have argued, to the contrary, that these treatises on "The

Integral Omnipresence of Being" provide Plotinus' carefully developed elucidation of the concept of eidetic causation or participation, a concept that lies at the heart of metaphysical Platonism. This generates an obvious question: On what basis does Bréhier divorce VI.4-5 from the Greek metaphysical tradition?

Bréhier apparently regards the main task of VI.4-5 to be the elucidation of Plotinus' doctrine concerning "the relations of the individual soul to the universal Soul."<sup>22</sup> He goes on to argue that Plotinus' treatment of the relation between the individual *psyche* and the hypostasis *Psyche* is strikingly similar to the account of the relation between the Atman and Brahman to be found in the Upanishads<sup>23</sup> and strikingly different from anything to be found in the Greek metaphysical tradition.<sup>24</sup> It is on this basis that Bréhier separates VI.4-5 from the mainstream of the history of Platonism.

To be sure, there can be no doubt that Plotinus' monopsychism plays a significant role in the argument of the treatises on omnipresence (e.g., VI.4.14-15 are devoted to answering standard objections to the monopsychistic theory affirmed in VI.4.6). However, if the general argument of this paper is sound, then one of Plotinus' main concerns in VI.4-5 is to develop a philosophically adequate account of eidetic causation or participation; the doctrine of monopsychism comes up in the course of his analysis of eidetic causation, but it never assumes the status of the central problem of the treatises. Thus, I think we may conclude that Bréhier's divorce of VI.4-5 from the Greek metaphysical tradition rests on a certain misdirection of emphasis in his interpretation of the treatises, a misdirection of emphasis towards the problems of monopsychism and away from the problems of eidetic causation and participation.

I have claimed that the doctrine of monopsychism comes up in the course of Plotinus' analysis of eidetic causation, and this raises a final question: Why does Plotinus introduce a theory of monopsychism into his account of eidetic causation? I think this question can be answered along the following lines. In Section II of this paper, Plotinus' account of the *psyche*'s causal relation to the sensible world was discussed as a central aspect of this theory of eidetic causation, and I think it is fair to describe this theory of the sensible world as a form of metaphysical idealism. This theory, in common with all idealistic accounts of the sensible world (e.g., phenomenalism), faces the difficult problem of reconciling the intersubjective accessibility of the sensible world with the idealistic account of its existence. I suggest that Plotinus, in common with many other idealistic metaphysicians, offers a theory of monopsychism in order to explain (on idealistic principles) how there can be one sensible world, equally accessible to all experiencing subjects (or *psychai*).<sup>25</sup>

This explanation of Plotinus' adoption of monopsychism in the theory of eidetic causation may seem rather speculative; however, I think it derives some support from an obscure passage in VI.5. At VI.5.9.1-13, Plotinus offers the following argument in defense of monopsychism:

Now, if someone were to maintain that the totality of the elements already having come into being are [brought together] in a single spherical figure, then it

would be clear that the sphere is not produced by many [causes] working with regard to parts, one part being separated from another which itself works toward the production of a part. Rather, the cause of the production must be one, producing as a whole in itself and not producing different parts of the sphere by different parts of itself. Otherwise, there would be many again, unless you refer the production to a unity without parts, or, better, unless the thing producing the sphere is a unity without parts which is not itself spread throughout the sphere by the producing; rather, the whole sphere is dependent upon the thing producing it. Thus, one and the same life possesses the sphere, the sphere itself having been placed in one life; moreover, all the things in the sphere [i.e., the totality of the elements] are in one life. Therefore, all *psychai* are one.

At first glance, this argument may seem rather peculiar since the argument itself (lines 1-10) appears to establish only that there must be a single cause of the totality of the elements (i.e., of the sensible world). The monopsychistic conclusion (indeed, the "psychistic" conclusion) is derived from the identification of this single cause of the sensible with a single life, and in the light of Section II, such an identification is not at all unexpected. What remains somewhat unclear is the reasoning that Plotinus uses to support the claim that the productive cause of the sensible world must be a unity. At one level, we might see in this an application of the traditional Platonic principle that "like causes like," the unity of the sensible thus being caused by the unity of the *psyche* responsible for it. However, at a deeper level, I think that the obscure words of VI.5.9 can be seen to mark Plotinus' recognition of the important fact that the sensible world is a public world. To explain the sensible world in terms of a multiplicity of psychical causes (particularly if this multiplicity were to include all individual *psychai*) would appear to leave the intersubjective accessibility and, indeed, the "objectivity" of this world ■ mystery. Thus, I suggest that Plotinus introduces monopsychism into his account of eidetic causation in order to solve a general problem that faces any idealistic account of the sensible world.

My consideration of several major problems dealt with by Plotinus in VI.4-5 clearly shows that the treatises on "The Integral Omnipresence of Being" fall squarely within the tradition of Greek metaphysics. In these treatises, Plotinus deals at length with a number of philosophical problems that stem from the fundamental problem of metaphysical Platonism—the problem of characterizing the relation between the intelligible world and the sensible world. In coming to grips with these difficulties, Plotinus offers us a subtle and carefully developed explication of the Platonic concept of eidetic causation or participation.

# Cantor's Sets and Proclus' Wholes

ROBERT S. BRUMBAUGH

## I

This paper is rather an agenda for discussion than a finished argument. I started out with the intention of translating Stamatis's 1958 article on Cantor and Proclus, as the basis for a reevaluation of Proclus as a mathematician. (The article, which has received some attention in Scandinavia, but not in England or the United States, is Evangelos Stamatis, "Peri tēs theōrias tōn Synolōn para Platōni," *Praktika tēs Akademias Athenōn*, 1958, pp. 298–303.) Rather soon, however, it occurred to me that Proclus' philosophical position exactly fits the needs of contemporary mathematicians committed to *logicism* as a philosophic context for their mathematics. The crucial point here, for the mathematician, is that certain axioms which are needed, but which seem somehow extramathematical, appear in Neoplatonism as *philosophic* truths.

It next occurred to me that the similarities between Proclus' logic of parts and wholes and Cantor's operations with sets justified identifying set theory with the formal development of that science studying the kinship of all mathematical art which Plato projected in *Republic VII*, but which was not formally developed in

the classical period. This, if correct, offers a welcome addition to our Platonic formal logic and dialectic.

But the most interesting aspect of the paper was one that I recognized last, namely, that it is a case study of the way in which Neoplatonism can clarify and discuss twentieth-century technical philosophic problems. It is not only in foundations of mathematics that this can happen. The whole theory of democracy, whether called "participatory" or not, depends on a proper analysis of participation. The question of authority involves decisions as to the status and effectiveness of the principles of hierarchy in viable organizational structures. Other contemporary issues, ranging from psychology to religion, invite exploration of the implications of Neoplatonism.

## II

Over the past twelve months, American mathematicians have opened a lively discussion of the foundations of mathematics. The most popular position is one called *logicism*. This view is "realistic" (i.e., Platonic) in its view of the subject matter of the discipline; and it *defines* "mathematics" as the theorems that can be deduced from Cantor's set theory as formalized in eight axioms by Zermelo and Fraenkel (the Z-F axioms).<sup>1</sup>

One difficulty with the logicist project is that two of the needed axioms seem extramathematical in their stipulations of existence and constructibility. But these conditions, as well as the presupposed metaphysical "realism," would be satisfied if our colleagues would take Neoplatonism as their contextual philosophy. At least, this is one thesis my paper will explore.

The current discussion suggests a converse relation, as well. In 1958, in an original but highly technical paper, Professor Stamatis suggested that one section of Proclus' *Elements* (sec. H) anticipated the key definitions (if not the formalization) of Cantor's general theory of sets.<sup>2</sup> If this is true, it suggests that we must reevaluate Proclus' ability as a mathematician. Beyond that, it suggests to me that Cantor may finally have found the formal structure of a general mathematical science that studies "how the [other] mathematical sciences are akin." Plato projected this as the final study prior to "dialectic" in *Republic VII*; Iamblichus put together an anthology on the topic; Proclus, if Stamatis is right, almost hit upon it; but its full development may have had to wait until A.D. 1883. If so, we may be able to incorporate a new and powerful formal tool as part of our contemporary Neoplatonic philosophy.

## III

The Neoplatonists, Iamblichus and Proclus, thought that there should be a discipline of universal mathematics mediating between the world of ordinary language and mystical silence. But because the mathematics of their time was dominated by geometry, a suitable formal system was not at hand. Proclus, indeed, in pursuit of the needed study wrote a *Commentary on Book I of Euclid's Elements*.<sup>3</sup> The result

was a creditable venture in the history of geometry, but later scholars have found the talent revealed was moderately mathematical, if at all.<sup>4</sup> In quite another context, his *Elements of Theology*, Proclus started along another line by setting up—verbally, however, not algebraically—some theorems about parts, wholes, and elements that were more general than Aristotelian logic or Euclidean geometry.<sup>5</sup> The scheme vaguely outlined there was filled out in tight formal detail in 1883, by Georg Cantor, under the name of *general set theory*.<sup>6</sup>

The recognition of the similarities of Proclus and Cantor was first presented, as I mentioned, in the paper by E. Stamatis in the *Praktika tēs Akademias Athenōn* in 1958.<sup>7</sup> This article, in modern Greek and in a journal philosophers do not ordinarily read, has attracted some attention in Scandinavia, but has gone unnoticed in England and America. Meanwhile, Neoplatonists today have not claimed that their philosophic position is a viable one for precise work in the contemporary philosophy of mathematics, formal logic, or philosophy of science. By and large, its studies have been restricted to natural language and have tended, within that restriction, to focus on *eikasia* where emanation reaches the level of semblance, or on *noesis* where discipline attains mystical culmination. That concentration clearly does not contribute very much to current logic, physics, ethics, or politics; and even might lead a skeptic to wonder whether Neoplatonism can, by our century, represent more than antiquarian studies of magic, literary footnotes, and an invitation to mystical theology.

#### IV

One very modest intention of my present discussion is to return to Proclus and to argue that we should revise the generally accepted notion that he was not a very talented mathematician or logician. This appraisal, which rests mainly on his Euclid commentary (plus his rather wooden work with Aristotelian syllogistic), suggests that his contributions do not fall in the history of formal science proper. In turn, since Proclus was, of all the Neoplatonists, the one most enthusiastic about formalization, this suggests in turn that precision and Neoplatonic formalism may be incompatible; that our philosophy cannot be formalized; and even that, given any question of contemporary interest, we are likely, at best, to express a misty grievance over the fall of the Soul from Mind to Time.

As a ground for this reappraisal of Proclus, consider the following argument. Sir Thomas Heath, whose heroes were the great geometers, says in his chapter on Eudoxus that the talent of Eudoxus is evident from the fact that his definition of "number" is an exact anticipation of Dedekind's epoch-making definition of a "cut."<sup>8</sup> If the thesis of Stamatis's article is correct, his claim that Proclus anticipated the definitions of Cantor's general set theory would lead to the parallel conclusion that Proclus' talent—for mathematics of this algebraic type, even if not for plane geometry—must have been somewhat comparable to Cantor's.

What that order of talent is can be indicated by a brief note on the contemporary importance of set theory. We have already seen that contemporary proponents of the position of logicism as the foundation of mathematics simply define math-

ematics as the theorems formally deducible from the axioms of set theory.<sup>9</sup> And as we look at the special cases this includes, the inventory is impressive. This approach provides a new basis for the foundations of mathematics; it gives an entire new precision to the treatment of "infinite" amounts and numbers; it sharpens the definitions of "relative frequency" which ground the study of probability; it includes mathematical logic as a special case (hence it also includes Aristotelian logic, which is, as seen by a modern mathematician, simply a cumbersome and degenerate case of mathematical logic). In short, Cantor's achievement certainly ranks with Dedekind's, and so by an extension of Heath's argument, we should conclude that Proclus and Eudoxus are somewhere close together.

#### V

Turning now to modern mathematics, I want to suggest that the current logicist program for developing the science is possible if, but perhaps only if, Neoplatonic metaphysics is a correct description of reality. Recall that the logicist program calls for the deduction of mathematics from the eight Z-F axioms that Zermelo and Fraenkel formulated as the basis of set theory.<sup>10</sup> Now, a recent appraisal of this enterprise in the *American Mathematical Monthly*, by an author who favors it, concedes that the program "is only 75% successful" because "two of the Z-F axioms have empirical content and so are not properly 'logical.'" These are the so-called Axiom of Infinity and the Axiom of Choice.<sup>11</sup>

The *Axiom of Infinity* asserts that there exist a transfinite number of entities on each level of set "elements." The *Axiom of Choice* asserts that a mathematician can construct special subsets by appropriate selection of elements from given sets. (But this "construction" is a definition by selective attention, not a creation *ex nihilo*.)

In effect, the comment that these axioms are not purely logical, on the level of *dianoia*, seems correct. The reason is, I think, that the axioms in question are rather philosophical descriptions or specifications of the universe in which mathematical logicism is possible. Thus the Axiom of Infinity describes the world of nature, with its separate individuals—its divisible material objects and successive generations of plants and animals. Given the Neoplatonic principle of limitation, which makes natural individuals *definite*, and the principle of plenitude which makes their generations *successive*, this condition of infinity will be satisfied. The Axiom of Choice describes the way of knowing of a human soul, which after its descent to time must recover ideas discursively and progressively. The ideas are together in a timeless system of relations, but we must learn this piece by piece, by acts of selective attention. Thus the first philosophical axiom stipulates that the world, being presupposed, is one that has definite individuality and succession on the relevant levels, and the second that the world also has freedom for selective attention and inquiry on the level of soul.

As a basis for discussion, let me define in more detail what I mean by "a Neoplatonic universe." In the first place, such a universe is stratified: there are in it abstract entities, concrete individual instances, and collections of like individ-

uals. These differ in their properties, but they are related. The abstract entities define—and in some sense cause—the extensional classes that *exemplify* them, and they are *instantiated* by the individual members of those classes. Things are arranged in hierarchies, with the more abstract and general entities serving as explanations and unifying causes for less general orders. One fundamental characteristic, then, is that there are at least these three levels, which are distinct but which are causally connected. There is also a background limitation of hierarchical structure and a foreground plenitude of contrast differentiation. Any two different forms are included in some hierarchy that has a third single form as its vertex. And any one form can be pluralized, on a more specific level, by division through cross-classification, adding contrary specifying attributes. Forms retain their self-identity; thus, from the standpoint of *F*, *FA* and *FA'* are equally *F*; and, similarly, *FA* is self-identical in *FAB* and *FAB'*. This algebraic symbolism avoids muddled puzzlements of "late learners" trapped in ordinary language, or limited to the visual constructions of plane geometry.<sup>12</sup>

Notice that where some Platonic universes may be tolerant of continuity and borderline cases, Neoplatonic ones are more definite and restrictive, and have quantum jumps. Thus the levels of being, though internally related, are discontinuous; participation of individual instances in form is subject to the law of contradiction; the membership of an extensional class is exactly determined. This may mean that the universe we have defined is more abstract and tidier than the one we actually inhabit. But since the two are isomorphic, we can use universal mathematics as the key to the world's structure with logic, ethics, aesthetics, and so on, as special cases.

## VI

In the present context, however, it is the other direction of the relation between the mathematical logician and the Neoplatonic philosopher that is of more interest to us. We may or we may not persuade a majority of the members of the American Mathematical Society to join us because we are Neoplatonists. But should we join *them* because they have formalized fundamental logical rules for our world of Neoplatonism? I think that we should, and that the alliance may give some new ideas to our philosophy. Let me turn now to that formal logic, via a more detailed consideration of set theory.<sup>13</sup>

In *Republic* VII, Plato recognized the need to develop two new mathematical sciences. The first of these was to be "solid geometry," a systematic deductive study of geometry in three dimensions.<sup>14</sup> The second, coming at the end of the mathematics courses and at the beginning of the study of dialectic, was to be a study of "how all the mathematical sciences are akin," "what they have in common."<sup>15</sup> No special name is given this in the *Republic*, but Aristotle's "universal mathematics"—a discipline he defined but did not develop—sounds rather like the same thing.<sup>16</sup> In any case, what the mathematical sciences do have in common is an abstract formal structure and a clear deductive proof procedure. It is interesting that the first of these desired discoveries was made within Plato's own lifetime, by Theaetetus and Eudoxus in the Academy; whereas the second had to await the

nineteenth century, and the work of Georg Cantor, for its full formal realization.<sup>17</sup> In the interim, the idea was not wholly forgotten: Iamblichus, for example, wrote a treatise (or anthology) on *The Community of the Mathematical Sciences*, and Proclus, as we have mentioned, had some very general formalization—particularly of the relations of forms, classes extensionally defined, and parts—in his *Elements of Theology*.<sup>18</sup>

But what is set theory? It has been described, half seriously, as a general formal system of which everything else in mathematics is a special case. The key to the enterprise is given by two of Cantor's characterizations of "set."

He writes: "A set is ■ bringing together of determinate clearly differentiable objects (*Objekte*), whether of our intuition or our thought—which [objects] will be called the elements of the set—into a whole."

In another, more illuminating, passage we find the following:

I view as collections, or sets, all multiplicities which are such as to be thought of as one, that is, all determinate collections of elements of such a kind that it is possible to find a single criterion capable of bringing them together, and I believe that in this way I define something which is akin to that which Plato, in his dialogue *Philebus*, calls "the mixed."

These definitions are clear enough, though very general. They suggest that wherever there is a Platonic form, it can serve as a criterion for class membership; the extensional definition of such a form will be the total collection of its instances, regarded as a whole; and, as we have seen, each "element" will be such that it determinately does possess the attribute which serves as membership criterion for the extensional set.

To see how this theory develops, I will follow the presentation of a modern mathematics text that has become a classic, Courant and Robbins, *What Is Mathematics?*, in their summary of "the algebra of sets" (pp. 108–117).<sup>19</sup>

At the outset, sets are defined in terms very like Cantor's.

A set is defined by any property or attribute *A* (Italic *A*) which each object considered must either possess or not possess: those objects which possess the property form a corresponding set *A* (Roman *A*). Thus, if we consider the integers and the property Italic *A* is that of being a prime, the corresponding set Roman *A*(*i*) is the set of all primes 2, 3, 5, 7 . . . .<sup>20</sup>

An important additional notion is next introduced.

*I* will denote a fixed set of objects of any nature, called the universal set or universe of discourse, and Roman *A*, *B*, *C*, will denote arbitrary subsets of *I*.<sup>21</sup>

This addition has the effect, desirable for our purposes, of adding a principle of hierarchy to the full generality of the first definition. For every convergent hierarchy (converging at a single topmost form) constitutes a universe of discourse within which subdivisions can be made by what Plato called "the great method of division"; but the top term (Courant and Robbins's *I*) cannot be defined within its hierarchy; it can be treated only if it can be included in a more general universe of discourse.

We will now turn briefly to the defined relations and algebraic operations of

sets. *Definition of subset*: A is a subset of B if there is no object in A that is not also in B (written  $A \subset B$  or  $B \supset A$ ). *Definition of equality*: If both  $A \subset B$  and  $B \subset A$ , we say A equals B ( $A = B$ ). Two operations are next defined: Set union (or logical sum) and set intersection (or logical product). *Definition of logical sum*: The sum of A and B ( $A + B$ , or  $A \vee B$ ) is the set of all the objects that are in either A or B, including those in both. Thus, if  $A = \{1,2,3\}$  and  $B = \{2,3,4\}$ ,  $A + B = \{1,2,3,4\}$ . *Definition of logical product*: The logical product of A and B (written  $A \cdot B$ , or  $AB$ ) is the set consisting of only those elements that are in both A and B. Thus, if  $A = \{1,2,3\}$  and  $B = \{2,3,5\}$ ,  $A \cdot B = \{2,3\}$ .

This system is more general than arithmetic. Taking a notion from Boethius's *de trinitate* (where it is introduced to defend Christianity against the charge of tritheism), we can say that this is an algebra for operation in the category of substance, whereas our ordinary arithmetic operates in the category of quantity. Thus "A and A" equals A, since A is not changed by being twice referred to. All the rules of the ordinary algebra of numbers are also valid in the theory of sets. Three laws, however, which have no numerical counterparts, "give this algebra of sets a simpler structure than the algebra of numbers."<sup>22</sup> These laws (10, 11, and 13 in the Courant and Robbins list) are:  $A + A = A$ ;  $AA = A$ ;  $A + (BC) = (A + B) \cdot (A + C)$ . In addition, there is the notion of "complement": the complement of A,  $A'$ , is the set of all the objects in I that are not in A. Thus,  $A + A' = I$ , and  $AA' = O$ .

The power of this basic formal system becomes clear when we look at some of its special applications and cases.

We can look now at some special applications and cases. The School mathematics Study Group has devised texts that show how ordinary algebra and arithmetic can be developed as one set of special cases of set theory. Mathematical logic can also be treated as an interpretation, both as class calculus and propositional calculus. The theory is thus general enough to include, or to be isomorphic with, a formal scheme that represents valid deductive reasoning in a symbolic form. The development of the computer rests on an extension of propositional calculus, originating in the recognition that "truth values," 0 and 1, can also represent open and closed values for two-position electric switches.<sup>23</sup> Thus, in handling information,  $A + B = 1$  if  $A = 1$  or  $B = 1$ , and  $A \cdot B = 1$  if  $A = 1$  and  $B = 1$ . Calculation in this system involves only very high-speed repetitions of the operation of "logical addition." In effect, this is a dialectical scheme remembering and comparing patterns of relations of being, same, and other. The superiority of mathematical logic and computer programs to the Aristotelian syllogistic system will be evident to anyone who has ever tried to design switches and circuitry for the automatic checking of the validity of Aristotelian syllogism and sorites.

In addition, as was mentioned before, set theory leads naturally to a new way of defining probability—an interesting bonus but perhaps one not immediately relevant to our present philosophical interests. However, it also leads to remarkable results when it considers "infinity": transfinite sets with transfinite cardinal and ordinal numbers. Precise definitions of orders of infinity, and of "greater than" among transfinite numbers, clears up a good many of the confusions hidden

behind the word "infinite." Further, it was shown by Robert Hartman that this extended set theory offers a model for formal value theory that avoids the counter-intuitive results of value theories that use only finite numbers for value comparison. This last point is philosophically very interesting since a good Platonic formalism ought to have applications to the theory of value as well as to more formal, abstract ontology.<sup>24</sup>

## VII

Let me now turn to Stamatis's suggested equivalence of Cantor's sets and Proclus' wholes, in his article "Peri tēs Theōrias tōn Synolōn para Platōni," *Praktika tēs Akademias Athenōn* 33 (1958), pp. 298–303.

The article opens with a quotation of Cantor's definition of set with its reference to Plato's *Philebus* at the end, which I quoted above. Stamatis next cites two passages from Plato's *Parmenides* (137C, 157D–E), which suggest that there could be a formalized treatment of parts and wholes. And he finds exactly such a treatment carried out in section VIII of Proclus' *Elements of Theology*, more specifically in propositions 66–69.<sup>25</sup> These are the following:

Proclus, *Prop. 66*:

All beings are related to one another either as wholes or parts, either as same or different.

Proclus, *Prop. 67*:

All wholeness is either prior to the parts, or arises from the parts collectively, or is in the parts singly. For we see that the form is the cause of each whole, and we call this the whole prior to the parts, which exists in the cause. Or the form is [considered] as participated in by the parts. And this is in one of two ways. For either the parts all share it, [as a collection] and it is this whole made of the [totality of] the parts, which will be destroyed if any part is removed; or each single part is a participant in it, so that each part is generated by its participation in the whole. And this makes the part a partial (*merikōs*) whole. Thus the whole as it exists [extensionally] is constituted from its parts; but as cause, it is prior to its parts; and as participated in, it is in each single part. And this holds even to the limiting whole [i.e., a least part] which is like the whole composed from parts, at least when it is not a part just by chance, but able to be included in a whole the parts of which are also wholes.

Proclus, *Prop. 68*:

Every whole which is in a part, is a part of the whole of the parts. For if it is a part, it is a part of some whole, and either of the whole in it itself—so that the whole is spoken of as the whole in the part; and in that way it is a part of itself, and the part will be equal to the whole, and in that case they are the same—or [it is part] of some other whole. And if of another, either it is the only part of this—and thus, again, it differs from the whole in nothing—because one existent part (*element*) partakes of one; or it is able to be included in another set, of which the parts are wholes.

Proclus, *Prop. 69*:

Everything which is a whole of parts participates in the wholeness which is prior to the parts.

Stamatis suggests that the three part-to-whole relations Proclus distinguishes match Cantor's basic definitions of his set theory.<sup>20</sup> Thus, what Cantor calls the criterion or defining attribute (Italic A, etc.) is what Proclus calls a "*holon*" in the sense of an *eidōs*, the "whole prior to its parts." (Proclus goes beyond Cantor here in assigning these *eidē* a causal role.) The whole "as existing," that is, as the extensional set of all the elements that have the defining attribute, is Cantor's set Roman A, exactly matching Proclus' "whole as coming to be from the togetherness of its component parts." Proclus' notion of a "part" and a "least part," however, does not exactly match Cantor's "element." Cantor's elements must have definite identities, so that they are unambiguously self-identical or other; Proclus' parts seem to satisfy that condition. The elements must be related to the Italic A, and so on, defining attributes by a definite either-or relation in Cantor's system. Proclus seems to leave room for "parts" that "are parts just by chance," and so do not imitate unity or wholeness in the way more proper parts do. In Cantor's scheme, it seems that the "objects" we perceive or think about are also "elements," and that for any attribute, every "object" either falls in the set Roman A defined by that attribute or in the complement of that set, Roman A'. But Proclus is less restrictive in his ontology. In the twentieth century, there have been theories of "fuzzy sets" where the notions of part or element are closer to Proclus than to Cantor.<sup>21</sup>

Cantor's scheme is clearer and easier to handle than Proclus' would be even if it were formalized. But it is clear that Stamatis's thesis is correct, and that Proclus' "wholes" are defined by the same three conditions used later to define his "sets" by Cantor.

In the context I have sketched, this not only commits us to a reappraisal of the role of Proclus and Iamblichus in the history of mathematics, and of their mathematical-logical abilities, but it also commits us to taking sides in the current controversy over the foundations of mathematics. We are not only committed to the *logician* position, with its "realism" and set theoretical formalization, but we come prepared to explain and defend the "philosophic" axioms necessary for the logicist enterprise axioms that fall in the field of metaphysics and epistemology rather than being formal logical axioms proper.

### VIII

Set theory exactly matches the worldview of a Neoplatonic modification of Plato's metaphysics—perhaps influenced by Aristotle—in which forms ingress in all-or-nothing way, and beings are located definitely and determinately on one or another level of emanation. This modification seems to me to correct, or at least to offer an alternative to, Plato's reliance on continuity and geometry, and to give more formal precision to the definition of the basic structure of participation.<sup>22</sup>

When Plato offered his project for the new science to explore the kinship of mathematical sciences, it was evidently something like formal logic that he had in mind. But for a thousand years, as the record of the Platonic scholia shows, his followers tried to realize this goal either by a "logic" of geometrical symbolism, or

by an analysis of natural language ordered in Aristotelian syllogism.<sup>23</sup> What was needed to carry out the project was—as Proclus saw—something more like Aristotle's "universal mathematics," a nonverbal formalism like algebra rather than like geometry. And the success of Cantor's system suggests that, in fact, a philosophy of formalism should consider his *Mengenlehre* as a leading candidate for the desired science of the formal structure of reality.

The materials are ready at hand for assembling a new systematic treatise on Neoplatonic philosophy, as an expansion of Proclus' system. Chapters could begin with metaphysics and general set theory; they could proceed to formal logic; then general arithmetic and algebra can be derived; and a theory of probability follows. The study of transfinite number is an elegant and useful extension. (For the moment, I will bypass the way in which we will introduce geometry.) And as a final section, there is already a good formal beginning toward extending the transfinite numbers and using them as models for a formal axiology, a mathematics of value.<sup>24</sup> This could bring together Cantor and Proclus: the pure mathematical formalism of the one, in the philosophic context of Platonism (and attendant mysticism) of the other.

# The Mathematics of Mysticism: Plotinus and Proclus

CARL R. KORDIG

One of the two great Neoplatonists is Plotinus. Dominus, Syrianus, Aedesius, and Iamblichus followed. Much more important, however, than any of these men is the celebrated Proclus of Athens. I wish to deal with Plotinus' views here. I also wish to deal with the later Scholarch Proclus Diodachus. I will focus on the question of self-reference and some related, logical-mathematical issues.

Proclus possessed a wide knowledge concerning the philosophies of Plato, Aristotle, and his predecessors. He combined with this knowledge a great interest in and enthusiasm for religion, both theory and practice. For example, he seems to have seriously believed he received, in some sense, revelations and was, in some sense of the word, the reincarnation of the Neo-Pythagorean Nicomachus. And at one time he toyed with the idea of solving the participation problem—the problem of the one and the many—by locating the participation relation itself in various occult “symbols” that reside in certain stones, herbs, and animals. Some say that Proclus was superstitious, that he believed in mermaids and goat-footed Pans and that his arguments from analogy were not always perfect as they might have been; for example, “from the fact that the Man in the Moon has eyes and ears but no

nose or mouth he can argue seriously that [all the] astral gods possess only the two higher senses” (Proclus *The Elements of Theology*, E. R. Dodds, trans., 2nd ed. Oxford: Oxford University Press, 1963, p. xxv). This is one picture that has been painted of Proclus. There are others and surprisingly sometimes by the same people. He had a universal wealth of information and learning at his disposal, such as his knowledge of the Pre-Socratics, Plato, Aristotle, and the earlier Neoplatonists. In this he had a serious and good influence on medieval thought; for example, I think, on Saint Thomas Aquinas. Proclus, at any rate, attempted to combine these elements in one carefully articulated system—a task his dialectical ability made possible. He was perhaps “a lively and living work of art,” a human torch. Other pictures painted of Proclus go still further. Thomas Taylor stresses that “of that golden chain of philosophers, who, having themselves happily penetrated, luminously unfolded to others the profundities of the philosophy of Plato, Proclus is indisputably the largest and most refulgent link. . . . Born . . . a genius, . . . he exhibited in his own person a union of the rarest kind [and that his] *Commentaries* [of Plato] were written by him . . . in the flower of his age.” Some go still further. The late Dr. Charles Burney, on being asked by Thomas Taylor whether he had ever read Proclus' *Commentaries*, replied that they were too much for him, at the same time exclaiming, “What a giant was Proclus compared to Longinus!” And Marinus says—I think rightly—“that he was a man laborious to a miracle.” And the eulogium of Ammonius Hermeas “that Proclus possessed the power of unfolding the opinions of the ancients and a scientific judgement of the nature of things, in the highest perfection possible to humanity,” does go too far; yet some think it should, as Thomas Taylor has it, “be immediately assented to by everyone who is an adept in the writings of this incomparable man” (for sources compare Thomas Taylor's introduction to Proclus' *Commentary on the Timaeus*).

The importance of Proclus perhaps seems to have been underestimated somewhat in the twentieth century. Fortunately, however, this situation is beginning to be rectified—especially since the clandestine founding some twelve years ago at Yale, under Professor Robert S. Brumbaugh's auspices, of the Clusion Society, and of the subject Clusion Network Theory, a founding *so clandestine* that it was clandestine even to its founders. “Objective links” have indeed recently been discovered between Proclus and medieval thought.

Saint Albertus Magnus, according to Dodds, and the Byzantine Neoplatonist Michael Psellus (1018–1078) were “steeped in Proclus.”

Copelston, Sambursky, and others have indeed recognized the brilliance, of Proclus. Paul Schaich has assured me that there is, in *The Elements of Theology* of Proclus, a deep anticipation of Bradley's argument against relations.

Proclus' entire system proceeds as follows: from the One emanate the Henads—a finite number; from the Henads emanates the sphere of *Nous* which subdivides as Being, Life, and Thought; from the sphere of *Nous* emanates the sphere of the Soul which subdivides into divine souls, demonic souls—angels, demons, and heroes—and human souls, for example, myself. There is a strong mystical strain running through his framework and the Neoplatonic tradition generally. It arises from the claim that the One is absolutely transcendent, beyond all thought and all

being, ineffable and incomprehensible. This claim readily appears in the doctrines of Plotinus,<sup>1</sup> Iamblichus,<sup>2</sup> and Damascius.<sup>3</sup> It is, however, most carefully dealt with and receives its most systematic espousal from the celebrated Proclus of Athens. Proclus' *Commentary On The Parmenides*<sup>4</sup> is a polished espousal of the first hypothesis of Plato's *Parmenides*. It is there that he expresses his own view of the One and shows his acute sensitivity to logical problems arising from it. I will attempt, among other things, to examine the tenability of Proclus' view of the One. In the course of this examination, I will evaluate some of his solutions to the logical difficulties resulting from his position as to the One. I wish to argue that the letter of his position, strictly speaking, is beset with insurmountable difficulties and that his solutions to them are unsatisfactory. It needs emendation.

Proclus does not merely interpret Plato's *Parmenides*. He also uses it dialectically to develop systematically what he feels are truths of theology and metaphysics. Viewing the eight hypotheses as metaphysical options, Proclus takes the first to be the correct one. As a correct interpretation of Plato's *intention* in the *Parmenides*, this is certainly suspect.<sup>5</sup> But Proclus is not merely an interpreter; he is also a metaphysician. He is concerned with the nature of things and with the development of truths of speculative metaphysics, and this must be evaluated independently of whether or not his interpretation of Plato is correct.

Proclus saw the point of the hypothesis as constituting a proof that there is an absolutely transcendent One. For Proclus and Plotinus, the One exceeds all qualification whatsoever. It transcends all properties and relations, all predicates, and all statements on our part. It transcends the predicates "Unity," "Cause," and "Good," just as it transcends "Being": "That which transcends all cannot, as has been shown, be susceptible of even a hint of a relationship to anything else." It is beyond existence, "nothing at all . . . belongs to it" (p. 45 [7]; compare also p. 67 [22–24]). It "is before every power and before assertions" (p. 75[3–4]); even negations are not true of it and are removed from it (pp. 71 [35–37], 77[4–5]). The "most glorious One is neither expressible nor knowable" (p. 71[30]). It is impossible for any property to apply to it, being "inexpressible" and "unutterable" (pp. 41[25], 67[3,35]). No name or description applies to it; there is no perception or knowledge of it; there is no opinion that fits it (pp. 45 [6–14], 47 [21]–49 [12], 51 [25–30]). This is, of course, not because it is less than any of these things but because it is more; for example, "it is superior to being and existence and better than intelligible objects" (p. 45[32–33])—so superior that it is "the object of desire to all things" (p. 57[37]). It is essentially unintelligible, yet so important that all being, practice, and knowledge presuppose it. Proclus later (in *The Elements of Theology*) incorporates this conception into a comprehensive metaphysical system. And by so doing he arrives at what is perhaps the most systematic and thoroughgoing negative mysticism known to man.

I now wish to argue that Proclus' and Plotinus' position as to the One is beset with insurmountable logical difficulties. Proclus and Plotinus claim that no descriptive predicate whatsoever applies to the One. Let us assume this. Now let us introduce a new term "Proclusian" in the following way: for any  $x$ ,  $x$  is Proclusian if and only if  $x$  is such that no descriptive predicate applies to it. The

phrase "such that no descriptive predicate applies to it" is, if meaningful, obviously a descriptive predicate; therefore, so is the term "Proclusian," which is merely an abbreviation for the latter phrase. The One of Plotinus and Proclus is such that no descriptive predicate applies to it; therefore, from the definition of the descriptive predicate "Proclusian," the One is Proclusian. But since "Proclusian" itself is a descriptive predicate, it also follows that the One is not Proclusian. But strictly speaking this is contradictory, which is absurd. Proclus—and Plotinus—claim that no descriptive predicate whatsoever applies to the One leads to contradiction and must therefore be abandoned. If the One is "Proclusian," it follows that it is not the case that the One is such that no descriptive predicate applies to it, and hence not Proclusian. The claim that the One is such that no descriptive predicate applies to it implies its own negation. Hence it is untenable: if we asserted it, we would also be forced to assert its negation, and we cannot intelligently assert both it and its negation. Claiming that no descriptive predicate applies to the One *ipso facto* forces us to also make the contradictory claim that some descriptive predicates apply to the One. This claim of Plotinus and Proclus, is, therefore, strictly speaking, logically untenable. I have argued in detail elsewhere<sup>6</sup> that Proclus' own and quite sophisticated replies to this objection fail. His replies, although more detailed and in many ways more sophisticated, are just like Quine's advocacy of ontological relativity and of the revisability of logical laws, and they fail for the same reason: namely, they are self-refuting.<sup>7</sup> I find it reasonable to conclude, therefore, that Proclus' main thesis in his *Commentary On The Parmenides*—that the One is not expressible—is untenable.

Proclus ends his *Commentary* with two sentences that succinctly express the principal theme and outlook of the Neoplatonic tradition: "For by means of a negation Parmenides has removed all negations. With silence he concludes the contemplation of the One." Now a silence justified by irrational means (i.e., by untenable claims and bad arguments) is not really justified. It is an irrational silence. And I have argued that there are insurmountable logical difficulties with the "means" by which Proclus "has removed all negations." By a demonstrably untenable negation, Proclus has removed all negations. Therefore, I feel that such a mystical "silence," for Proclus, would be unjustified.<sup>8</sup> For these reasons, then, I think that an espousal and development of the first hypothesis in Plato's *Parmenides* will not result in a viable metaphysics, as Robert S. Brumbaugh has argued in his book, *Plato On The One* (New Haven: Yale University Press, 1961).

This conclusion, of course, need not hold with respect to more positive mystical characterizations of the One. If we are inclined to sketch the One in a more satisfactory manner, then we should also be prepared to deal with its mystical features in a more positive way.<sup>10</sup> Any degree of ineffability that remains might then be recognized as arising because most categories that we apply to ordinary, finite objects are not applicable to the One, and not because no categories whatsoever are applicable to it. If we feel that the concept of the One may be a viable concept, then indeed we must be prepared to recognize that it is something that has properties, although admittedly quite special properties. If we feel this way, however, then we must also be prepared to construct an adequate

logic governing the rules and guiding principles of such a notion in which all absurdity will be carefully circumvented. This Professor Brumbaugh has also begun to do by stressing the analogies between Proclus' work and Cantor's set theory (see his "Cantor's Sets and Proclus' Wholes," pp. 104–113 of this volume).

Robert S. Brumbaugh suggests that set theory is "a leading candidate for the desired science of the formal structure of reality." Indeed, I think that the Plotinian or Proclusian One could be used to define Kurt Gödel's set theory, for example,  $U$ , the universal class which is not a member of any class but which contains every set (sets are members; classes that are not sets are not). Let the logical notion of membership and the metaphysical notion of participation correspond to each other, which seems natural. Then to say that the universal class  $U$  is not a member of any class is to say that it is unparticipated. Hence we could say that the One that defines the universal class  $U$  is also unparticipated because what it defines—the universal class—is unparticipated.

A further point suggested to me by Brumbaugh for exploration is the possibility of asymmetrical relations between the One and other entities in the Neoplatonic system. All beings since they are one are like the One, but the One is by nature like no being other than itself. Or put simply, we are like the One, but the One is not like us. Participated being, however, does resemble the One in this: they have existence in common, and things receiving existence from the One resemble the One, which is the primary and universal source of all existence.

The objection, however, is that resemblance is a symmetrical relation. Hence, if some participated beings were like the One, the One would be like a participated being which is false; as Isaiah puts it: "to whom will you liken, God?" (Isaiah 40:18). The reply is that resemblance between cause and effect is not a symmetrical relation: for example, we would call a photograph a likeness of a woman but not vice versa. Saint Thomas Aquinas makes the same point in his answer to the question, "Can creatures be said to resemble God?" (*Summa Theologica*, The First Part 1A, question 4, article 3, objection 4).

The set-theoretical axiom of infinity postulates an infinite number of objects. Dodd's, however, interprets Plotinus as assuming a finite number of forms. And Proclus, in proposition 94 with respect to a numerical infinity, adopts an Aristotelian concept of the potentially infinite. The upshot is that Robert S. Brumbaugh's suggestion that Proclus is committed to contemporary logicist-realist ontology may not be entirely accurate. Plotinus and Proclus may not be committed to the logicist-realist position with its axiom of infinity since, if Dodds is right, Plotinus and Proclus believed in a finite number of forms. Logicism-Realism with its set-theoretical Axiom of Infinity is, therefore, even more Neoplatonic than Plotinus and Proclus! And this conclusion will elate the hearts of Neoplatonists of the Robert S. Brumbaugh variety.

One attempt at reconciling logicism-realism and Neoplatonism would be to simply rely on the notion of the potentially infinite in interpreting the Axiom of Infinity. Yet, this would be less realist than logicist-realist ontology, such as the early Russell's and, I believe, Kurt Gödel's; yet, it would be more in accord with

Plotinus and Proclus who surprisingly are usually cited as illustrations of the excessive proliferation of entities. Interestingly, it also would be compatible with Aristotle's idea of the potentially infinite.

Nevertheless, in spite of all this I, like Brumbaugh, agree with much of the spirit of Plotinus and Proclus. I do think that much of what is true and valuable in their systems can be preserved intact. Therefore, I now wish to defend the plausibility of the existence of one "highest" form—whether it be the One of the *Parmenides*, the Good of the *Republic*, or the Beautiful of the *Symposium*. I will deal with three principal objections to such a highest form. Each objection will try to deny the possibility of a superform that is the cause of the unity, beauty, or goodness of everything else.

The first objection could be stated as follows: Either such a One (Good, Beauty, etc.) is itself part of some system or not. If it is, then we have an element of a system causing the unity of that same system, which is absurd. If it is not, and the One is outside the rest of the universe, it then could not "get together" with the rest of the universe. I would reply to this objection by maintaining that neither horn of the dilemma is absurd. Considering the first horn of the dilemma, I see nothing wrong with an element of a system causing the unity of that same system; the center element or component of a picture (system of related components) is itself an element of the picture yet this need not prevent it from causing that same picture's (system's) unity or beauty. For other reasons, however, this is perhaps not true of the One. The later horn of the dilemma—that if the One is outside the rest of the universe, it could not get together with it—presupposes that an explanation be required of the notion of participation; otherwise, it is not problematic. Participation is, however, a primitive notion (as Robert S. Brumbaugh has argued in his book *Plato on the One*). Hence, no explanation is required since participation would have to be based on either a physical model whose ordered pairs would be composed *entirely* of concrete physical entries or on an abstract formula or equation (e.g.,  $y = 4x$ ) whose ordered pairs would be composed *entirely* of abstract entries. Participation, however, *also* relates the concrete to the nonconcrete. Poetry might suggest such participation, but it could scarcely (or simply *would not*) be regarded by most as an explanation.

The second objection to the plausibility of there existing one single highest form—be it the One of the *Parmenides*, the Good of the *Republic*, or the Beautiful of the *Symposium*—could be stated as follows: Whatever we call this highest form, by its very definition it must be *all-inclusive*. But then the participation relation, too, must presuppose this highest form. This is absurd, however, since I have just argued that the participation relation is a primitive notion (i.e., simple and unexplainable in terms of other primitives, one of which is this highest form). That is, the participation relation is not explained by the "overform," since, if it were, participation would no longer be primitive. I would answer this objection as follows: One could only state that the participation relation derives its being ultimately from this highest form by saying that participation *participates* in the Overform. But this is equivalent to saying that participation *is* primitive in a

logical or epistemological sense (although admittedly not in an ontological sense) since it flows from the all-inclusive overform. Here, it would seem, is an example where an ontology is not exactly reflected by its epistemology.

The third and last objection to the existence of a highest form that I will consider might go as follows: That which particulars share, or that which particulars have in common, is a form. Hence, since all the forms are, in fact, forms or have the properties of form in common, one could assert that there must also exist a form called Formness. That is to say, the very same reason for positing the existence of each individual form (namely, that it could be "seen" to be common to a group of individuals)—as, for example, the form Number upon observing odd and even numbers—would exist for positing the form Formness, since each form is, in fact, a form. Thus we now have a form that would definitely seem to be an instance of itself. This is because Formness is a form. But now since the phrase "is an instance of itself" is meaningful, the phrase "is not an instance of itself" also would seem to be meaningful. Thus, one could conceive of the form of all-and-only those forms that are not instances of itself. But this form leads to Russell's Paradox by substituting "Form" for "set," and "is an instance of" for "is a member of." If this form were of the same logical type as those of which it is the form, then the contradiction would follow if one asked of it if it, itself, were an instance of itself. Since if it was, it would not be, and if it was not, it would be. Thus one should deny that the form of all those and only those that are not instances of themselves exists in the same way that one should deny that the paradoxical Russell set exists, namely, by the introduction of a set theory designed to avoid such paradoxes. Professor Brumbaugh's suggestion that set theory is the apt formalism for ontology, therefore, is again vindicated. Indeed, as the late Bar-Hillel puts it, in his book on set theory, the Russell paradox arises only if the paradoxical Russell set of all sets that are not members of themselves exists, not if it does not exist. And set theory is designed to bar the existence of such sets.

One might still object to the notion of an "Overform" by saying that on the copy theory view," since all the other forms are copies of this one, there must exist still another, even higher form, namely the form of resemblance by which the Overform and its "copiers" are similar. I agree with this objection and would meet it by simply denying the validity of the copy theory. A degree of participation theory would not, I think, yield the same contradiction regarding the Overform because one could claim that, although each other form partook of the overform, none partook of it *perfectly*. Hence, none of the other forms could be said to be perfect copies of it, and the allegedly higher form of resemblance, by which the Overform and its copies are similar, would simply not exist.

At first sight, once again, this too might seem to be implausible since the Overform and the other forms taken together would seem to be components of *one* system. Hence the oneness of this system would seem to be of a higher logical type than the logical type of the Overform (since the latter would be an element or member of the system). This would be true, I think, only if one utilized the now outmoded Russell hierarchy of logical types and if one could, in fact, assert that the Overform and the other forms (which are arranged in an ascending hierarchy)

are one, or are components or elements of *one* system. I would simply deny both, plausible as they may seem: the first—the Russell hierarchy—because Professor F. B. Fitch has proved that it is itself self-referentially inconsistent;<sup>12</sup> and the second on the grounds that the Overform's nature is such that it necessarily cannot be rationally or intelligibly thought of as an element of *another* One or another system. Nevertheless, as I noted earlier, in at least Gödel's set theory the One can plausibly be viewed as causing or defining everything else that is an element of the universal set.

A word about the relation of Plotinus and Proclus to later thought is in order. Plotinus felt that because *Nous*—the Intellectual Principle—proceeds in some sense from the One, it must be essentially different from the One. This, however, does not follow. Later, Thomas Aquinas and also, I think, Saint Augustine argue that the three Persons of the Trinity—although they can be distinguished (only) relationally—are not essentially different because their essence is the same, namely, supreme overflowing goodness itself. What this means is that any one person of the Trinity cannot be distinguished from the others by an intrinsic property, but instead only by using ineliminable reference to the other persons. That is, the Father is not begotten from the Son, but the Son is begotten from the Father. And the Father and the Son do not proceed from the Holy Spirit, but the Holy Spirit does proceed from the Father and the Son.

# The Anatomy of a Neoplatonist Metaphysical Proof

RONALD HATHAWAY

*The Elements of Theology* (Στοιχειώσις θεολογική) of Proclus Diadochus, the fifth century Neoplatonist commentator and philosopher, is the earliest extant rigorous metaphysical system in which every proposition is proved and is an element in the succeeding body of propositions.<sup>1</sup> Of the 217 proofs in Proclus' treatise, the proof of proposition or theorem 1 is the most significant and problematic. It is the first *element* in Proclus' system. The logic of the proof is more difficult to grasp than is implied by those who have tried to grapple with it. A better understanding of Proclus' sources in the proof, and the general model of reasoning at work in the proof illuminates many obscure aspects of this ancient example of the striving for logical rigor. In what follows I take a close look at the logical anatomy of Proclus' proof and draw general conclusions about Proclus' sources in the proof and about Proclus' general model of proof.

The title of Proclus' treatise, considering the fact that he wrote an extensive commentary on Euclid's *Elements* (Book I), apparently is what leads both L. S. Rosán and R. T. Wallis to contend that all of Proclus' proofs are consciously modeled on Euclid; and it was this view, with the addition of another common

view—that Euclidean geometry is a formal axiom system—that prompted Bréton to try to formalize the logic of Proclus' proof.<sup>2</sup> Bréton's attempt at formalization is incomplete and raises many questions, some of which I note below; others are noted by Bréton himself. Why is this the case? My own analysis suggests that any treatment of the proof as a formal derivation is bound to be very difficult, and very likely is impossible in principle. At the outset it is important to note that even if Proclus had modeled his proof on Euclid, it does not necessarily follow that Proclus' system is reducible to a formal axiom system in Hilbert's sense.<sup>3</sup> Ian Mueller has criticized A. Szabó's view that Euclidean geometry is an axiom system in the modern sense, arguing cogently that Euclidean postulates are not assertions of existence-assumptions, but are statements that "license" the performing of certain imaginary cognitive operations with idealized physical bodies.<sup>4</sup> The modern axiomatized remnant of Euclidean geometry does not represent this part of the central core of Euclid's geometry.<sup>5</sup>

It is my contention that Proclus' proof of his first theorem presupposes a postulate-like assumption that licenses an infinitely continued operation. In this one respect, namely, in needing a postulate of this type, his proof does share an important feature with Euclidean geometry. However, it does not follow from this that Proclus consciously modeled his proof on Euclid. There is evidence that Proclus intended to make the *Elements of Theology* (*E.T.*) a non-Euclidean treatise. At the level of what he consciously intended, it seems that Proclus' model of reasoning in the *E.T.* is not Euclid. I thus reject the view held by Rosán and Wallis, with the qualification that the fact that the reasoning of Proclus and Euclid have some feature in common is of general significance. It highlights the point at which ancient metaphysical and mathematical reasoning intersect or *overlap*.

## I

Proclus' first theorem is that "Every multitude partakes in some way of unity."<sup>6</sup> I consider the meanings of its component terms below. This proposition may sound trivial or, perhaps, axiomatic. However, if we substitute "set" for "multitude," at the risk of anachronism, the task of defining a set and the problems involved in proving that every set has a certain general feature might convince us that what Proclus is undertaking to do is far from trivial in its level of difficulty. Although I will argue against treating Proclus' "multitudes" as sets, we should approach Proclus' task—proving a truth at the foundation of his metaphysics—as one both ambitious in scope and potentially difficult.

A brief glance at the place of the *Elements of Theology* in the history of philosophy will help us to gain added perspective. It is the general consensus (Beutler, Lindsay, Dodds, Wallis') that the *Elements of Theology* is the first (extant) rigorous metaphysical system, that is to say, a system of propositions each of which is proved. No one would dream of treating the long, tangled lines of argument in Aristotle's *Metaphysics* (many of which lack even a decisive conclusion) as attempts at rigor in this sense. The frequent pairing of Proclus with Spinoza<sup>8</sup> is appropriate, and one could add the names of Descartes (in the *Princi-*

ples) and perhaps Leibnitz. A lengthy digression would be needed to explore the topic, but it is possible that the recovery of the *Elements of Theology* in early modern times, especially after Patrizzi's Latin version in 1583, planted the seed of the rationalist program.

One striking difference between Spinoza and Proclus should nonetheless be noted. In his *Ethics* Spinoza states axioms and definitions, before enunciating propositions to be proved, revealing his debt probably both to Descartes and to Euclid. Proclus, on the other hand, enunciates proposition 1 in the *Elements of Theology* without stating any prior definitions, axioms, or postulates. He nonetheless assumes that his argument for proposition 1 is a proof, that is, that his premises are true and the argument is logically valid in a rigorous sense. Dodds, Proclus' great modern commentator, claims that most of Proclus' proofs are "formally correct."<sup>9</sup> Yet, *prima facie* must we not admit that they lack one of the cardinal features of Euclid's rigor as we ordinarily understand it, namely, the clear statement of *every* assumption that will play a logical, definitional, or operational<sup>10</sup> role in the system of proofs? On the face of it, Spinoza is indebted to Euclid and Proclus is not.<sup>11</sup>

This problem poses a number of perplexing questions and issues. Is Euclid in fact the model for Proclus' proofs? And if so, what does this mean for our grasp of the logic of his proofs, their "correctness," or validity? If their logic is the same as Euclid's, what is the logic on the type of rigor actually found in Euclid? If Proclus had other sources or models, did they share features with Euclidean reasoning or not? We cannot canvas in detail the ancient Pythagorean methods of proof, the arguments of Zeno of Elea, Plato's *Parmenides*, or Aristotelian and Stoic logics, but any one of these could conceivably have influenced Proclus (and, I shall argue, Zeno and Plato certainly did). I will briefly consider this problem of sources below. For the moment, it will help the reader if I state in advance what position I take with respect to this inquiry *ad fontes*. Although in his proof of Proposition 1 Proclus consciously intended to produce a nongeometrical and, therefore, non-Euclidean proof, his mind was so deeply imbued not only with Euclid, but with the entire general model of reasoning used by the Pythagorean geometers, Zeno, and Plato (on occasion), that he *unconsciously* adopted it. I will later identify more specifically what I mean by this "general model of reasoning."

An ancillary and neglected point relevant to any study in the history of ideas is that the existence of this kind of a gap between consciously and unconsciously adopted ideas shows that the whole thought of an author may be an unintended outcome, or an outcome in conflict with the author's intended outcome, despite the fact that his work gives every appearance of being wholly the product of conscious design. Some scholars give token recognition to this gap but they do not recognize the possibility that what we call the "thought" of an author is subject to "invisible-hand explanation."<sup>12</sup> The *Elements of Theology* is a good case for a test of a type of invisible-hand explanation, since *all* of its substantive content, if Dodds is correct,<sup>13</sup> is derived from preceding sources. The theory of explanation lying behind the traditional inquiry *ad fontes* is in need of much closer scrutiny. In what follows, I simply use Proclus' proof as a sample of the "gap" in question.

## II

What does Proclus set out to prove in proposition 1? Πᾶν πλῆθος μετέχει πῇ τοῦ ἐνός can be taken to mean "every [all] multitude [mass] partakes in some way of unity." Because this translation differs from Dodds' in certain respects, and because the meaning of the component terms will be important in any analysis of the logic of Proclus' proof, I will comment on and justify the version offered. (πλῆθος) was used to refer to crowds of people or things, especially those of indefinite number or size. From this use it acquired the use that refers to a purely quantitatively large number of things. It always could connote either number or magnitude, however, and it is in this vague but common sense that Proclus uses the word. The vagueness of the term πλῆθος allows reference to something indefinitely large, that is, something of some large but unspecified size or number. It does not by itself refer to something of *infinite* size or number. Plato (*Parm.* 144A6) carefully uses πλῆθος ἄπειρον, not πλῆθος alone, to refer to an infinite multitude. It is significant that in his proof Proclus assumes that a πλῆθος is some kind of "whole" (ὅλον), namely, an indefinite "many of which the multitude [is composed] (πολλὰ ἐξ ὧν τὸ πλῆθος)."<sup>14</sup> Yet he never uses any of the available terms for "part" (μόριον, μέρος) to refer to what "makes up" a πλῆθος. In a sense, Proclus masks the problem of choosing how to regard these items. In another sense, he simply leaves the matter open to interpretation. Not only are we initially ignorant of what kinds of things (minds? disembodied souls? matter?) there can be multitudes of, but we do not even know whether a multitude is a "whole" like a number, a countable totality, or like a continuous magnitude, a divisible whole. Proposition 1, we must remember, is intended to lay a general foundation.

This unrestricted idea of πλῆθος intuitively seems close to our notion of a multitude, but the notion of a *mass* of something seems also connoted. By "mass" I do not mean the physicist's mass (inertial rest-energy of ■ body), but the general notion implied by phrases such as "mass of people" or, if we think of rock or water as indefinite collections of bits of rock or bits of water, such as "mass of rock" or "a mass of water." Because it is the normal and accepted synonym, I will use the term "multitude" rather than the term "mass" in what follows.

Bréton argues that the expression "every multitude" implies the universal quantifier.<sup>15</sup> Bréton is correct, but his claim raises a question: What does the quantifier range over? Some find it natural to treat Proclus' multitudes as sets.<sup>16</sup> Treating Proclus' multitudes as sets is not as "natural" as it may seem, though there are analogies between sets and multitudes. What makes the view unnatural are the following considerations. A minimal description of Cantor's notion of sets would be that sets are definite and distinct collections of definite and distinct members, that subsets of sets (or class inclusion) must be distinguished from members of sets (or class membership), and that there must be a role for empty sets, for unit sets and for infinite sets. When we examine Proclus' proof, we will find that: (1) his notion of the components of multitudes does not allow for a

distinction between things that are members of multitudes and subsets of multitudes (i.e., it is impossible to distinguish subsets from members of sets); (2) his proof fails if there are empty or unit multitudes; and (3) Proclus' concept of the infinite is too weak to accommodate infinite sets. In addition, it is highly unclear what sorts of operations can be performed on Proclus' multitudes. The term *πλῆθος* has a cousin verb *πληθύνω* that means "increase" in any of several ways, including "growth." This implies that a Proclus-multiplicity might become larger if its components grew; which is false of sets. As for *analogies* between multitudes and sets, it is possible that Proclus' later theory of "wholes" (Props. 66–69) offers analogies with a theory of sets. The only analogy that I will consider here is that between the unstated postulate that Proclus' proof presupposes and the Zermelo-Fraenkel Axiom of Choice (regarded as an axiom of constructibility of subsets). However, even there, I will not concede a *strong* analogy.

"Every multitude *partakes . . . of unity*." It is unnecessary to enter into the often arid controversies about the sense and import of the use of "to partake of" *μετέχειν* in Plato and his commentators. Damascius, Proclus' younger contemporary, remarks that "partake of" basically means "to have" (*ἔχειν*) something.<sup>17</sup> Whatever metaphysical elaboration Proclus and Damascius would add to this, Damascius' claim is an attempt to penetrate the meaning of the term. For our purposes, we may assume that if something "partakes of" unity, then that thing *has* unity. The text of Plato's *Parmenides* that seems to be the proximate source of proposition 1 (157C1–2: "The others are not wholly deprived of unity, but partake of it in a way") assumes that partaking of unity is possessing or having unity.<sup>18</sup> I assume that this point is in no way contentious, but obvious, as a semantic truth, no less to us than to Damascius.

"Every multitude *partakes in some way of unity*." Proclus' use of the expression "in some way" *πῃ* seems to imply that he has in mind Aristotle's observation that there are many ways in which one can say of something that it "is one," but nowhere—here or elsewhere in the *Elements of Theology*—does Proclus cite *Metaphysics* Iota or show that he intends to apply Aristotle's observation. In his proof, it will become clear that Proclus wishes to make a substantive claim about the two logically possible ways in which a multitude can have unity.

"Every multitude *partakes . . . of unity*." The expression rendered as "unity" is the definite expression "*τὸ ἓν*," so often rendered as "the One" in scholarly literature. It seems that Dodds is correct in preferring "unity" as a synonym of "*τὸ ἓν*." If the *Elements of Theology* is a general or, as we might say, a foundational work, then it should not begin by assuming the existence of something unknown and indefinable that bears "the One" as a name. Later in the work, admittedly, Proclus seems to use "*τὸ ἓν*" as the name of the "first cause" of all things. What is important is not whether "the One" is used as a name, but rather whether what this is the name of has properties that are imported *ad hoc* in the proofs in a whimsical way, or whether these properties are uncovered by means of the proofs themselves. If Proclus' intention is to build a foundational system without prior assumption, then the expression "*τὸ ἓν*" should bear its most obvious meaning and not function as the name of something whose identity and properties are unknown until a time when they are sneaked into his proofs. It

may be objected that Proclus is so deeply committed to post-Plotinian Neoplatonic systems that there is simply no longer any question of an un-Neoplatonic use of "*τὸ ἓν*." This objection is at times based on the premise that Plato himself uses "*τὸ ἓν*" as the name of an entity (e.g., the Good) rather than as an expression to refer to unity. Controversy here is abundant and I will not enter into it, aside from noting that Owen and others have argued that "*τὸ ἓν*" is Plato's expression for unity, and note that Aristotle is apparently the first to use the term "unity" (*ἐνότης*).<sup>19</sup> In any case, even if Proclus' use of "*τὸ ἓν*" is somewhat unclear, his proof of proposition 1 does not depend on anything other than the notion of unity. If Proclus' proofs are not consciously modeled in every respect on Euclid, Proclus was aware that one of the hallmarks of rigorous reasoning, of "clarity and articulateness," is the statement of "the common notions."<sup>20</sup>

These observations, I believe, will suffice to support my interpretation of Proposition 1 as the claim that "Every multitude partakes in some way of unity." It is, as I understand it, a straightforward and simple claim. Its proof, though deceptively short, is neither straightforward nor simple.

### III

Proclus' proof of proposition 1 has the logical form of what he calls "a reduction to the impossible."<sup>21</sup> As it was employed in ancient times, the *reductio* was the oldest and, in some ways, the most powerful tool of argument known. It was used virtually from the origins of Greek geometry; was used by Zeno of Elea; is used by the "Parmenides" in Plato's dialogue of that name; is used by Euclid for certain important proofs; is well known to Proclus; and, if Szabó's suggestion is correct, provided the basis for the later development of the powerful method of "analysis" mentioned and used by Pappus.<sup>22</sup> The opening words of Proclus' proof are: "For if [a multitude] in no way partook [of unity]. . . ." Proclus assumes that the contradictory of the proposition to be proved and to be assumed for the sake of *reductio* is, "Not every multitude partakes in some way of unity." It follows that he must show only that something impossible is entailed by assuming that any given multitude in no way partakes of unity.

Because Proclus' actual proof is unschematically set out and is not broken into its smallest logical components, I have, for the reader's convenience, reproduced the proof in its original *sequence*; but I have broken it into manageable and logically (more or less) minimal components. I also intersperse occasional comments or queries, or note where a premise must be provided in more explicit form to help the reader foresee where difficulties will later emerge. The proof runs as follows, starting with the negation of the proposition to be proved, anticipating *reductio*.

1. Suppose that a multitude were in no way to partake of unity.<sup>23</sup>
2. "Neither the whole multitude nor each of the many making it up" will be one."
3. "Each of the many making up the multitude will be a multitude, and this [is the case; is true] to infinity."

4. "And of these infinite [multitudes] each will again be infinite multitude."

(4) is puzzling, since it is unclear how each of the (first level) infinite multitudes "will again be" infinite multitude, that is, what differentiates this contention from the trivial claim that each of the infinite multitudes *is* [an] infinite multitude. Note that (3) and (4) together seem to explain, if only partially, what is meant by (2). *Not being one* will be taken to mean *being infinite multitude* and also something else, namely, the infinite reiteration of whatever step it was that introduced *being infinite multitude* in the first place (or at the first level). This fact, that *not being one* is interpreted by Proclus as a complex predicate or characteristic which imports an indefinitely continued operation, will prove to be of central importance later. That is, we have here two uses or senses of "infinite" (ἄπειρον). One, referring to infinite collections, and another, referring to infinite generations by some step or steps, of infinite collections.<sup>24</sup>

5. A multitude partakes of unity either with respect to the whole multitude or with respect to each of the things in it.

Proclus speaks of the many that make up a multitude as being "in it." Notice that if ■ πλῆθος could be an undifferentiated mass or continuum, it would still make sense to speak of things "in" it as its *potentially* differentiable bits, although Proclus is silent about these different possibilities. (5) has the ring of a definition (of "partakes of unity"?), or an axiom. In any case, Proclus does not produce any argument for (5), and treats it as an indemonstrable truth. In the text, (5) occurs as part of a larger sentence, "[A multitude] that partakes of no unity in any way, either with respect to the whole or with respect to each of the things in it, will be infinite in every way and through and through." It is clear that "either with respect to the whole or with respect to each of the things in it" is a distinct assumption, and is understood to be logically exhaustive of the ways in which a multitude can partake of unity. The remainder of this larger sentence is equivalent to the following assumption:

6. A multitude that in no way partakes of unity will be infinite in every way (παντῇ ἄπειρον) and through and through (καὶ κατὰ πᾶν).

The logical implications of the infinite "through and through" will be discussed shortly. The literal force of καὶ κατὰ τᾶν is "and for all," that is, "and for every item" where each item is a suitably defined successor in a string of successors.

7. "For as regards each of the many, whichever one takes, it will either be one or not one."

The "for" (γάρ) introduces a new and independent argument for (6).

8. "If each of the many is not one, it would be either many or nothing."

One might expect Proclus to have first considered the case with respect to the whole multitude. The remainder of the proof considers only the case with respect to "each of the many" (τῶν πολλῶν ἕκαστον). This seems to leave a lacuna in

his proof. Note that Proclus assumes that "one," "many," and "nothing" are logically exhaustive predicates.

9. "If each is nothing, then whatever is made up of these (τὸ ἐκ τούτων) is also nothing."

The proposition behind the consequent of (9) is almost certainly to be attributed to Zeno.<sup>25</sup> Proclus treats it as a truth not in need of proof.

10. "If each is many, on the other hand, each is made of an infinite times [succession] of infinities (ἄπειράκις ἄπειρον)."

The term ἄπειράκις literally means "time without number," "indefinitely many times." The notion that Proclus evidently intends to capture is that of an infinite *succession* of steps carried through on an infinite number of entities, each both a component of a multitude and itself an indefinite multitude in turn. No proof of (10) is attempted. But why does Proclus think that (10) is true? In (6) he has already specified the general idea of a through-and-through infinite. In (10), he now assumes the carrying out in thought of the through-and-through operation in question. The appeal in (10), therefore, is to a postulate that licenses such an operation. Below I will consider how Proclus could have stated his assumptions here more clearly. Note that he could not *prove* the truth of (10) because it relies on a *postulate*, and on the intuitive carrying out of what is postulated. That is to say, a cognitive operation or experiment involving an infinite succession of steps is an essential part of the proof itself. The reliance on a postulate, though implicit, exhibits a resemblance between Euclid and Proclus. Proof (10) also illuminates why Proclus' proof is difficult or impossible to formalize. I will return to this point again.

11. "These things [viz., the consequents of (9) and (10)] are impossible."  
12. "For it is impossible for something to be composed of nothing."

(12) is treated as a necessary truth; (12) would rule out, for Proclus, the concept of the empty or null set. This would constitute another strong reason against any attempt to treat Proclus' multitudes as sets.

13. "And nothing that is is made up of an infinite succession of infinities."

This is curious, for Proclus goes on below to prove (13). Since (13) is for him ■ logically necessary truth, we would expect him to write it in the form: "Nothing that is *can* be made up of an infinite succession of infinities." Perhaps Proclus assumes that since (13) is universally true, it must be true *at least* of everything that exists, whatever Proclus would include in his ontology.

14. "For there is nothing greater (*pleon*) than the infinite."  
15. "And that which is made up of all [of certain items] is greater than each [item]."

These jointly are meant to constitute a proof of (13). These two propositions seem to correspond, at least loosely, to an ancient notion of the infinite criticized by Aristotle, namely, "that than which nothing is beyond ["outside"],<sup>26</sup> and to Euclid's

axiom, "The whole is greater than the part."<sup>27</sup> I will argue later that the logical faults in Proclus' proof are concentrated here in his attempt to prove the truth of (13)—or what amounts to the same thing, his attempt to prove that (10) involves an impossibility.

16. "Therefore, every multitude in some way partakes of unity."

The conclusion follows by the principle of *reductio* arguments. Proclus' conclusion is not marked with either of the conventional Euclidean formulas, "Which was to be *proved*" for theorems, or "Which was to be *done*" for problems. Proclus was well aware of the importance of this distinction in Euclid.<sup>28</sup> Let us assume that he wished to avoid Euclidean conventions. Let us also note, however, that his proof may have "problematic" as well as purely "theorematic" aspects.

#### IV

Although many questions could be raised, there are two that I intend to address to Proclus' proof: (a) Is it "formally correct," as Dodds implies? (b) What feature, if any, does it share with Euclidean proofs?

Proclus assumes that multitudes can have unity in only two ways, either as wholes or through the unity of their components. He then argues that a multitude cannot have unity as a whole if its components lack unity. He assumes, without argument, that unity of components is a necessary condition of unity of a whole multitude.<sup>29</sup> In the case where the components are nothing, the whole is nothing.<sup>30</sup> The proof then turns on the case where the components are each many. In (3) and (4) he claims that a kind of infinite regress of infinities occurs in this case. What he means by saying that "each of the many . . . will be a multitude, and this to infinity," and "of these infinite [multitudes] each will again be infinite multitude," is then restated in (6), "[each such multitude] will be infinite in every way (παντῇ ἄπειρον) and through and through (καὶ κατὰ τὰν)." It is the argument for this notion of through-and-through infinity that is at the heart of his proof.

What Proclus assumes, but does not clearly state, is that a necessary condition of the proof is the "thought experiment" of taking unity away from every successor component of every component of the multitude in question. This is the meaning of the phrase, "and this to infinity," and of the sign of iteration, "again" (πάλιν), used in (4): "each of these infinities will again be infinite multitude." Zeno's argument against plurality, using the notion of through-and-through division,<sup>31</sup> uses a construction with the same general strategy, although Proclus does not rely on *division*. Proclus has abstracted from Zeno, it seems, the general notion of an infinitely extended through-and-through operation for suitably defined successors. Sinnige and others have shown how Zeno's strategy might well have developed with the use of the γνῶμεων in early Pythagorean geometrical number theory.<sup>32</sup> Before we consider Proclus' debts to his predecessors, let us consider the validity of his proof.

That his proof fails should be obvious from an examination of his attempt to prove the impossibility of the consequent of (10), that is, that each component "is

made up of an infinite succession of infinities (ἀπειράκις ἀπειρών)."<sup>33</sup> This turns on his proof of (13): "And nothing that is is made up of an infinite succession of infinities." This depends on the truth of (14) and (15). Both of these are false, we would claim. Before saying why they are false, let us note that Proclus does not have a sufficiently strong conception of the infinite within his own tradition. Aristotle had criticized an older conception of the infinite as that than which nothing is greater. Aware of the use of the infinite in geometry, Aristotle suggests his own notion of the infinite as  $\infty$  progression or a power of progressing to something always greater.<sup>34</sup> Because Proclus' commentary on Euclid does not extend as far as X. 1, which introduces the so-called "Axiom of Archimedes," it is impossible to tell precisely what his attitude toward the method of exhaustion as used in classical theory of irrationals may have been.<sup>35</sup> Perhaps Proclus had a special reason for appealing to the older notion of the infinite, namely, that it permits us to conceive of the infinite as *complete*, which is implicit in Proclus' through-and-through operation. However, his conception of the infinite is insufficiently strong. Even if Proclus had anticipated the notion of infinite sets, both (14) and (15) are false as stated. It is false that there is nothing greater than the infinite. Some infinities are greater than others.<sup>36</sup> It is also false that whatever is made up of certain items is greater than *any* items, because an infinite set is equivalent to, not greater than, at least one of its proper subsets.<sup>37</sup>

Should I be charged with a *tu quoque*? Am I not guilty of doing what I forbade in interpreting Proclus' proof, namely, introducing talk about sets? My defense against the accusation would be that I am claiming only that the modern concept of infinite sets helps us to see with some precision why Proclus' proof fails, not that the notion of sets will enable us to fully *represent* Proclus' reasoning in the proof.

A different objection to my interpretation is that what Proclus means in (13) is that no existing thing *actually* consists of an infinite succession of infinities. This objection raises another question: What is the ontology—the list of types of entities of which proposition 1 is intended to be true? The base ontology in Neoplatonism is a hierarchy of minds, intelligible forms, disembodied souls, embodied souls, bodies, and the underlying matter of bodies. Is Proclus arguing, in effect, that none of these is actually an infinite succession of infinities? To air the controversy implied by this question goes beyond the bounds of my argument (indeed, how could the issue be settled?). The decisive reason for rejecting this objection is the fact that the *Elements of Theology* is a programmatic treatise that intends to provide the "elements" not only for a theological system or cosmology, but a unique "nonhypothetical science" that provides foundations for every other science. I will present evidence for this contention later. My present point is only that proposition 1 is a truth that must hold true of all entities, and this must include mathematical entities such as line segments. What Proposition 1 asserts is not restricted in its scope.

Proclus' first proof is invalid. However, this does not exhaust its potential significance for us. In particular, what debt, if any, does the proof have to Euclid? The preceding comments on the proof have already answered this question: Pro-

clus presupposes a postulate that licenses the performance of a certain operation and, to this extent, resembles a part of the core of Euclidean geometry. Their general mode of reasoning is similar in using something like constructions. What is the real significance of this? Mueller has argued that one must not think of the Euclidean postulates as simply introducing veiled existence-assumptions, and contends that they are statements that have no truth values.<sup>40</sup> The first postulate, "Let it be postulated to draw a straight line from any point to any point," is neither true nor false, nor, lest anyone momentarily think so, is it a rule of inference of any kind. Euclid's famous constructions are built up on these licenses. Proclus was himself clearly aware of these "doings" or "productions" (ποιήσεις), "sectionings," and other operations in geometrical construction building.<sup>41</sup> Above I contended that the step of critical import in Proclus' proof was his assumption that the use of the predicate "is not one" introduces an infinitely iterated operation of some kind, one generating a series of entities and removing unity from every successor in the series. It might be said that Proclus uses a certain type of construction. It certainly is not a geometrical construction. How do I remove unity from a multitude according to Proclus' construction? I would take unity away from a building if I were to reduce it to a pile of bricks and mortar; but the individual bricks will have their unity. Since the unity of a multitude depends on the unity of its components, my act of removing unity from the building is still incomplete. For Proclus, the removal of unity is through and through, or involves everything that "makes up" the multitude. There are two logically distinct ways in which a multitude is "made up" of elements: it is made up of its immediate elements, but also is made up of all elements of these immediate elements, on whatever level. Proclus' operation is that of removing unity from the components of a multitude on every level.<sup>42</sup>

The notion of an operation that enables us to move from some feature of a component to the same feature for every successor reminds one of mathematical induction, which permits generalization for all successors where these are numbers. It is significant that the principle of mathematical induction itself is a postulate (of Peano) that cannot be proved. Perhaps more interesting than this is that the postulate that Proclus presupposes reminds us of the Zermelo-Fraenkel axiom of choice which allows the construction of all subsets of a given set.<sup>43</sup> This leads us to wonder what Proclus' postulate would look like if it were explicitly asserted. We might imagine it tentatively as follows: *Let it be postulated to remove unity from every component of a multitude.* I do not propose to draw any surprising conclusions from this rather vague postulate. Limiting myself only to what seems obvious, we might conclude that Proclus' proof is quasi-Euclidean in requiring a postulate at all, especially a postulate licensing an operation or mental construction. The postulate is strange in that it is really a postulate of deconstruction or of the deconstructibility of multitudes. The postulate is also exceedingly general and abstract in form. Proclus might well have contrasted his presupposed postulate with the standard constructions of geometry, which could usually be visually modeled or imagined as translated into manipulations of material objects. However, the central point remains: however sharp the contrast between ancient geom-

etry and Proclus' proof (the "visualizable" and the truly "intelligible"), Proclus is not allowed logically to suppress his postulate. The fact that he fails to assert it or any definitions or axioms must have some explanation. What this is I will, in a moment, suggest.

With the laying bare of this postulate, I will assume that the anatomy of Proclus' proof is reasonably clear to us. What general conclusions *about the proof* can we draw? First, it should be clear now why Bréton found it difficult to formalize the proof. A standard formal derivation with finite steps and no postulate for generating infinite multitudes is bound to fail. A symptom of Bréton's difficulty is his rather surprising indecision as to whether Proclus' proposition 1 is an axiom or a theorem!<sup>44</sup> This leads us to a second conclusion, namely, that the *status* of Proposition 1 is necessarily either (1) that of an *unproved* proposition, either false or true, or (2) that of an *unprovable* proposition, either true and necessary without proof or undecidable, or unprovable because false. If (1) is the case, proposition 1 could be true and *as yet* unproved. Or it is false. If its contradictory does not entail an impossibility, as my analysis implies, then its contradictory may be true (for all we know). Proclus' attempt to prove Proposition 1 by *reductio* might thus be thought of as similar to Saccheri's ill-fated attempt to prove Euclid's fifth postulate by *reductio* (ill-fated because it failed and significant because it led to the discovery of non-Euclidean geometries). That is to say, Proclus' attempt could lead philosophers conceivably to look for alternative metaphysical systems! If the Proposition's status is that of the second case (2), it could be unprovable simply because false, or unprovable and true. If unprovable and true, proposition 1 may not be a theorem but an *axiom* (as Bréton suggests), or perhaps a cryptic partial *definition*, as I have suggested (compare Note 16). On the other hand, if it is really a theorem in some system and unprovable, it could be an *undecidable* formula of the kind that Gödel's theorem proves must exist for suitably defined systems.

These two conclusions, about the formalizability of Proclus' proof, and about the status of his Proposition 1, are closely related and raise several questions. For instance, is there another proof of Proposition 1 that is either valid or formalizable? Is Proposition 1 in any way provable? If it is not provable, is this true because it cannot be made a theorem in any system? Or is this true only for the system of Proclus? These and other questions are raised here only as an agenda for future investigations.

## V

In conclusion, I will consider the question about Proclus' intentions in his proof and in the *Elements of Theology* insofar as his debts to Plato shed light on this. About his debts to Plato, I wish to make only two claims: (1) that Plato anticipates Proclus' use of the infinite in his proof in a passage of the *Parmenides*, and (2) that Proclus' metaphysical system in the *Elements of Theology* is modeled on Plato's description of the "downward" half of the procedure of dialectic (*Republic* VI. 511B3-C2), the descent from a first "unhypothetical" (ἀνυπόθετον) starting

point. About the nature of these debts, I further wish to claim that while Proclus knew Plato's *Parmenides* well, his own use of the infinite is probably not a conscious adaptation of Plato's argument; on the other hand, the *Elements of Theology* is probably consciously and intentionally modeled on Plato's programmatic remarks in *Republic VI*.

1. In an extended passage at *Parmenides* 158B–C, "Parmenides" asks us to think of "the things other than unity" *before they have acquired unity*.<sup>45</sup> Referring to these as "multitudes" (πληθῆ), he then goes on to construct a kind of thought experiment.

Now if we choose to take in thought from such multitudes the least portion we can conceive, that portion also, if it does not possess unity, must be not one but a multitude. And if we go on in that way considering just by itself, the nature other than the form, any portion of it that comes into view will be without limit of multitude.<sup>46</sup>

Dodd notes that Proclus relies in some way on this passage, but denies that Proclus' proof is the same as Plato's argument in the passage.<sup>47</sup> Dodds is correct. Proclus' proof is not the same as the extended line of argument used by Plato. The *Parmenides* commentary gives no hint of any conscious borrowing from the passage.<sup>48</sup> The inference that anything that is not one is a multitude seems to echo Zeno's arguments against plurality, and since Proclus himself appears to use Zenonian assumptions, as already noted, and may have had direct access to the lost arguments of Zeno as well,<sup>49</sup> it is possible that a lost argument of Zeno is the common source for both Plato and Proclus.<sup>50</sup>

This question of Zeno as a source aside, the *Parmenides* passage proves that Plato also uses as a strategy of proof a kind of thought-construction in which an infinite sequence is built, each successor inheriting some feature. Plato's conclusion—that any portion of any given multitude will be "without limit of multitude" (lit., "infinite in multitude")—does not assume a through-and-through operation, and in this respect Proclus drives the argument further. But Proclus' conclusion is simply the generalization of the same operation for *every* component. There is no evidence in the *Elements of Theology* that Proclus made any conscious use of the *Parmenides* passage, and it seems natural to infer that we have here an example of an *unconscious* borrowing or, at best, a borrowing filtered through the *Parmenides* commentaries of Proclus' predecessors, for instance, that by Plutarch of Athens.

2. In his commentary on Euclid, Proclus defines as "elements" all those "theorems whose understanding leads to the knowledge of the rest."<sup>51</sup> Thus he regards Euclid I. 1 as an element of Euclid I. 2, and so on. By analogy, his own proposition 1 could be regarded as an element of proposition 2. Proclus' comment leaves the status of Euclid's definitions, postulates, and axioms unclear. Are they "elements" even though not theorems? Proclus later notes the problem about these sorts of "starting points" (ἀρχαί) and the distinction between them and "the things followed from the starting points" (τὰ ἐπόμενα ταῖς ἀρχαῖς).<sup>52</sup> Referring to definitions, postulates, and axioms, he comments that Euclid "divides them into

hypotheses, postulates, and axioms."<sup>53</sup> Proclus thus calls definitions "hypotheses." A little earlier, he had made these remarks:

The general arrangement of its [geometry's introductory] propositions we should explain somewhat as follows. Since this science of geometry is based, we say, on hypothesis and proves its later propositions from determinate first principles—for there is only one unhypothetical science, the other sciences receiving their first principles from it—he who prepares an introduction to geometry should present separately the principles of the science and the conclusions that follow from the principles, giving no argument for the principles but only for the theorems that are derived from them.<sup>54</sup>

In this passage, Proclus uses the term "principles" to refer not to the first theorems in Euclid, but to all of Euclid's definitions, postulates, and axioms, that is, everything, for which Euclid gives no "argument." When Proclus says that Euclid's geometry is "based, we say, on hypothesis and proves its later propositions from determinate first principles," it is this body of *unproved* principles that he has in mind. Clearly, Proclus is, therefore, using the term "hypothesis" here in a broader sense than later, where it refers only to definitions in geometry. It is *because geometry uses unproved principles* that it is said to be based on *hypothesis*.

Proclus' cryptic comment about a unique "unhypothetical science" now seems clearer. The term "unhypothetical" (ἀνυπόθετον) for Proclus means "not based on unproved propositions." An "unhypothetical science" would be a system of propositions none of which is unproved. It would have no definitions, postulates, or axioms. Its first theorem would be proved, but without the use of any unproved propositions. Proposition 1 of the *Elements of Theology* is obviously meant to be an example of such a theorem. The *Elements of Theology*, it seems we must infer, is Proclus' attempt to work out the system of the unique unhypothetical science.<sup>55</sup> In it no proposition is unproved and every proved proposition is an element of some successor proposition (theorem).

Proclus' use of the term "unhypothetical" (ἀνυπόθετον) unmistakably points toward its first striking use by Plato (at *Republic* 511B6). There its meaning again depends on the meaning assigned to "hypothesis" (ὑπόθεσις). Important issues depend on the meanings assigned to "ὑπόθεσις" in Plato's dialogues, and I will not belabor the topic. But does it follow that Proclus is consciously pursuing Plato's program in the *Republic* passage? I have purposely said only that this is "probable." Proclus belongs to a tradition mediated by a lengthy development of post-Plotinian hierarchical metaphysical systems, a tradition dominated by *Timaeus* and then *Parmenides* exegeses.<sup>56</sup> This tradition regards *Republic VI–VII* as giving clues to a correct interpretation of Plato's metaphysics. If *Republic VI* is Proclus' "source" in the *Elements of Theology*, it may be so only in the sense that it was the initial impetus and stimulus behind a long sequence of systems.

In conclusion, it seems that a central question emerges from this analysis of the anatomy of Proclus' proof, one concerning the nature of the relationship between ancient metaphysical and mathematical models reasoning. We found Proclus' proof inadequate on two basic grounds; its use of a weak notion of the

infinite and its failure to state a postulate that is logically necessary. Now we find that Proclus probably intended to exclude unproved propositions like this from his system on principle. There is a tension between the Platonic "unhypothetical" model and the tendency of Euclidean rigor to force out every element, even those held at an intuitive level, until they take on an explicit form in the system. This tension between the nonhypothetical and the hypothetical routes of thinking—in Proclus' sense of these expressions—is like a distant mirror in which the aims of modern intuitionist and logicist metamathematical theories can be seen dimly reflected. The same tension, seen in another mirror a millenium earlier, appears in the controversy over the "objects" of διάνοια and ἐπιστήμη, their sameness or difference, on Plato's Divided Line.<sup>57</sup> The central question is: What is the nature of the irreducible *overlap* between ancient metaphysical and mathematical modes of reasoning?

As an added dividend, my analysis has provided a test of the usefulness of invisible-hand explanation in the history of ideas. We have found that although Proclus designed the *Elements of Theology* as an anti-Euclidean system, at least one element in his strategy of proof is Euclidean in its general role and is best explained by the historical influence of a complex Euclidean tradition. The *Elements of Theology* is an outcome that is partially explained by factors lying outside its author's conscious intention as well as by what the author intended.<sup>58</sup>

## *The Idea of False in Proclus*

EVANGHELOS A.  
MOUTSOPOULOS

If, according to contemporary conceptions of the ways that lead to knowledge, it is possible to proceed to distinctions such as those established between notions like truth and rectitude or correctness, on one hand, and falsehood, error, or mistake' on the other, this analytical point of view does not always seem to have been obvious in ancient thought and in its medieval prolongations. Within this framework one has the impression that logical values are roughly limited to only two, that is, the positive and the negative. Parmenides had already connected being with truth, nonbeing with falsehood.<sup>1</sup>

On this basis, it was easy, as well as necessary, for Parmenides to proceed to ■ radical distinction between being and nonbeing (each one of them being considered as nonreducible to the other') and, consequently, between truth and falsehood. Plato was the first to admit, in his so-called metaphysical dialogues, that this radical distinction is not absolutely valid, and that, in some way, the being is nonbeing, whereas nonbeing is being to a certain extent.<sup>4</sup> Against Parmenides' absolute dogmatism, Plato's epistemology, after his own metaphysical crisis,<sup>5</sup> orients him towards a moderate dogmatism whose skeptical aspects will be devel-

oped by Plato's successors at the Academy.<sup>6</sup> On the contrary, the Neoplatonists will largely inherit the fundamental dogmatic views of the theory.

Plotinus, namely, thinks of the possibility of conceiving the being as a non-being, and vice versa, when he refers to matter,<sup>7</sup> and this is, of course, in conformity with the purest Platonic tradition.<sup>8</sup> However, he also does so when he refers to the soul itself, which he considers to be the most dramatic hypostasis, since it is submitted to a certain distortion, and even to a certain separation.<sup>9</sup> One part of its being attracted by the Intellect, and the other tending towards matter which, in some respect, is a nonbeing.<sup>10</sup> In the same way, and in spite of the fact that they are suggested by dynamic structures of human existence, and are therefore endowed with some kind of reality,<sup>11</sup> products of imagination are nonbeings, according to Plotinus, and, consequently, belong to the group of erroneous contents of consciousness.<sup>12</sup> Nevertheless, Plotinus connects false opinion, a notion of purely Platonic origin,<sup>13</sup> with judgment whenever the latter deviates from its right way<sup>14</sup> because of its relation to imagination itself.<sup>15</sup>

Strictly conceived, deviation, erring, or wandering are the specific characters of error. However, Plotinus connects error to falsehood, although this is not always obvious in the *Enneads*.<sup>16</sup> The difference between the two notions seems to be better indicated in Proclus. This does not mean, of course, that any kind of detaching of the soul is erroneous, that is, that it leads to wrongness; for, when the soul tends towards the One, it is capable of grasping it "by detaching itself from imagination and opinion and indefinite knowledge . . . and by adapting itself to the Intellect."<sup>17</sup> Thus, falsehood depends on what cognition is able to detach itself from: (a) correct judgment or (b) conversely, those very attractions that cause its deviation from correctness. Proclus here refers not to two different and opposed eventual outcomes of thought, but to two entirely different levels of estimation of its value.

Error relies on some principle of unstructured or, at least, disorganized non-methodical deviation of thought from correctness. It is associated with the concept of plurality<sup>18</sup> as opposed to the principle of unicity on which correctness relies.<sup>19</sup> On the contrary, falsehood is defined as the reversal (*punctum contra punctum*) of every part or element of a given proposition or thought; a reversal that is supposed to be methodical enough to assure that the negation of what is reversed will appear as "true" and "likely."<sup>20</sup> Likelihood thus seems to be the *conditio sine qua non* of falsehood, whereas such a condition is not necessary to error, which denotes a certain freedom of thought.

Nothing is, of course, true or false in itself, but always in relation to something else. It is neither itself nor this "else," but its relationship to this "else" that makes it possible for it to be considered as true or false. Everything is true or false according to what it is related to.<sup>21</sup> Such a relation<sup>22</sup> should be understood as a "proposed"<sup>23</sup> connection that may be successful in one case, while being a failure in another. This seems to be the real meaning of Proclus' assertion that everything is true and that even if something partly contains falsehood (i.e., if at a certain point of view its correctness is damaged), it can be completely restored.<sup>24</sup>

Proclus probably does not mean by that that something is even partly true or

false *in se*. This would neither bring us back to Parmenides' poem nor to Plato's theory of the mixed, for reasons differing, of course, in either case, and easy to understand.<sup>25</sup> On the contrary, assuming that truth and falsehood can coexist as far as good or bad usage of what is subsequently called true and false may be made in two different cases, it is not sufficient to declare something true or false in general.<sup>26</sup> On the contrary, it is necessary, just as Socrates did, to proceed to the evaluation of truth and falsehood inasmuch as each one of them is inherent in everyone's conception of true and false,<sup>27</sup> for ignorance is comparable to some temporary impotence of reason, which is equivalent to falsehood. This is proved by the omnipotence of reason itself.<sup>28</sup>

Imaginary data, for instance, should be interpreted as such, because whenever they are attributed to objective reality without any previous examination of their nature, they are falsified themselves.<sup>29</sup> However, Proclus believes that such data correspond to some kind of *idola tribus*,<sup>30</sup> and that they are related to passions.<sup>31</sup> Passions are relevant both to the rational<sup>32</sup> and to the irrational<sup>33</sup> soul. Paradoxical and peculiar divine processes,<sup>34</sup> as well as apparent movements of the stars,<sup>35</sup> are realities falsely interpreted by the human mind. The falsehood of such opinions clearly appears through an accurate control of noetical processes.<sup>36</sup>

A noetical process may lead to truth only when it is correctly and consequently based on a given principle.<sup>37</sup> However, such a principle might be chosen in advance in order to imply results or conclusions also chosen in advance.<sup>38</sup> In such cases of sophisms that are the result of deliberate and intentional processes, falsehood also appears as the result of an additive or subtractive alteration,<sup>39</sup> and as the effect of a substitution.<sup>40</sup> One here again meets the particular and specific mechanical character of falsehood considered as a lie (i.e., as the reversal, *punctum contra punctum*, of correctness), which has been mentioned before,<sup>41</sup> and which differentiates falsehood both from correctness and error. In conformity to this model, geometrical methodology offers criteria for controlling falsehood in geometrical constructions and proofs.<sup>42</sup> Even in a completely false thought, as has already been said,<sup>43</sup> there still remain some elements of truth<sup>44</sup> that form the potential, yet adequate, criteria of its falsehood.<sup>45</sup>

In order to draw a conclusion from the above observations, one may refer to a very significant text of Proclus, according to which the main cause of falsehood is inherent in multiplicity as opposed to unicity which, in its turn, is the cause of correctness. Multiplicity is associated here with the sensible world,<sup>46</sup> and hence, to corruption of the intellect which, under such conditions, is in constant revolt against itself.<sup>47</sup> More obviously than Plotinus, Proclus accepts, in this case, the model proposed by Plato's *Sophist*, of the being of nonbeing as reaching the nonbeing of being,<sup>48</sup> as being reflected on the functioning of thought itself. Thus, by referring to Plato, he applies, in a more concrete manner, the Parmenidean reduction of the "ontological" to the "epistemological" by reducing being to nonbeing, and vice versa which, according to Parmenides, are absolutely not reducible to each other.

# Participation and the Structure of Being In Proclus' Elements of Theology

LEO SWEENEY, S.J.

The title of this paper, not surprisingly, indicates its contents. Accordingly, let us see what it means, beginning with "structure of being." Following Webster's Dictionary, we shall take "structure" to mean an arrangement of interrelated parts or constituents dominated by the general character of the whole they make up. "Being" can be synonymous with "reality," which, because equivalent to "unity" in Neoplatonism, would transcend "being" in a strict sense and thus encompass even the One Good as primal reality. Or it can signify "being" strictly, which in Neoplatonism is equivalent to "one-many" and, hence, is not applicable directly to the One. "Participation" in this context is the process by which (or the situation within which) what is lower is made real and becomes related to other realities (both peer and higher) by somehow receiving its intrinsic reality from what is higher.

Now, participation is not operative on the highest level of reality because the One neither participates in anything else nor is it participated in by anything directly (this point is explicitly made by Proclus).<sup>1</sup> Consequently, participation is not immediately operative in the structure of being when the last noun is under-

stood as identical with "reality," which in Neoplatonism equals "oneness." But participation permeates the strata of "being" when intended technically by Neoplatonists as "one-many." Therefore, it directly accounts for the structure of "being" in this sense inasmuch as participation helps arrange beings<sup>2</sup> in and on definite levels of greater and less perfection, all of which are related to what is above and among themselves and all of which are characterized directly by "being" and mediately by "unity."

If the preceding two paragraphs are basically accurate, despite their tightly abridged and simplified version of being, participation, and other key notions, it will be instructive to study in Proclus what participation means and how participated perfections and participants arise. What follows is the result of rethinking and restating points made in my paper published more than a dozen years ago in a *Festschrift* (of which only a limited number of copies were printed and which has been out of print for several years), "The Origin of Participant and of Participated Perfections in Proclus' *Elements of Theology*" (*Wisdom in Depth: Essays in Honor of Henri Renard* [Milwaukee: Bruce, 1966], pp. 235-256). I hesitated to present a version of this paper again until rereading it during graduate courses in 1971 and 1979 entitled "Providence in Proclus" convinced me that the explanation given there of participation remains helpful but is so complicated (the complication arising from Proclus' own theory, I would like to think, rather than from my own intellectual density and awkwardness) that even if someone may have read the earlier and no longer extant version, he or she would have forgotten it or, at least, might be so puzzled by it as to welcome this current restatement.

This will consist in three parts: Participation as a Process, The Origin of Participated Perfections, and the Origin of Participants.<sup>3</sup>

## PARTICIPATION AS A PROCESS

Here let us see in what participation as a process consists by listing its results and by briefly examining its extent. But first, a brief discussion of three Greek terms and their translations.

As Proclus describes participation (e.g., 182. 160. 5-10), it involves three different but closely related factors. The first is ἡ μέθεξις, which we shall customarily translate as "the process of participation," "the participative process," or simply, "participation." The second is τὸ μετεχόμενον, which literally means "that which is participated" or simply, "the participated." It is that which is received by the participant through the participative process, while simultaneously being also that which is given by the monad that is the source of the process and which is itself unparticipated. It is not really distinct from the monad (at least, not adequately so). It is not anything abstract but is a concrete reality or perfection—for example, henads are *ta metechomena* communicated by The One to beings; henads and beings are *ta metechomena* communicated by The One and The Being to intelligences; intelligences are *ta metechomena* communicated by The One, The Being, and The Intelligence to souls, and so on. Ordinarily we would translate the Greek expression as "the perfection participated" or "the participation" (the addi-

tion of the article sets the last apart from "participation" as a process, where no article is affixed to the noun). But whatever the translation (Dodd's is generally "the participated principle" or "the participated term"), it should be understood in the light of the aforementioned: it refers to a concrete perfection that is communicated by a monad to a participant and which, at best, is only mentally distinct from the monad and, sometimes, even from the participant. The third factor is τὸ μετέχον, "the participant."

Now let us return to our original question: In what does participation as a process consist? This we can answer by listing its results and by examining its extent.

One result of the participative process is that the perfection participated is present within the participant.<sup>4</sup>

[140, 124, 7-13:] A participant which is suitably disposed is not baulked of its participation; so soon as a thing is ready for communion with them [henads or gods], straightaway they are present—not that in this moment they approached or till then were absent, for they are eternally unvarying. If, then, any terrestrial thing be fit to participate them, they are present even to it: they have fulfilled all things with themselves, and though present more mightily to the higher principles they reveal themselves also to the intermediate orders in a manner consonant with such a station, and for the lowliest orders there is a lowly mode of presence.

[142, 126, 3-7:] While the gods are present alike to all things, not all things are present alike to them; each order is present in the degree of its capacity and enjoys them in the degree of its presence, which is the measure of its participation.

A second result is that the participant is filled, completed, perfected:

[24, 28, 10-13:] The participant was incomplete before the process of participation and by that process has been made complete: it is therefore necessarily subordinate to the participation inasmuch as it owes its completeness to that process.

[78, 74, 11-14:] That potency which needs some extraneous pre-subsistent actuation, the potency in virtue of which an item is potentially, is imperfect. For it needs the perfection which resides in another in order to become perfect by participating it.

[98, 86, 29-31:] We mean by "cause" that which fills all things naturally capable of participating it, which is the source of all subsequents and by the fecund outpouring of its irradiations is present to them all.

Because the participation is present in and, thereby, completes the participant, this latter becomes similar to the source of the participation.

[25, 28, 27-34:] Completeness is a part of the Good, and the complete qua complete imitates the Good. . . . The more complete is the cause of more effects in proportion to the degree of its completeness, for the more complete participates the Good more fully; that is, it is nearer to the Good; that is, it is more nearly akin to the cause of all; that is, it is the cause of more.

[182, 160, 7-10:] If the process of participation makes the participant be like the participation and causes it to have the same nature, it is plain that a soul which participates and is annexed to a divine intelligence is itself divine, participating through the mediation of the intelligence the divinity immanent therein.<sup>5</sup>

Still another result of the participative process needs to be explicated and stressed. Participation also involves the fact that the participation literally becomes *part* of the participant.<sup>6</sup>

[12, 14, 7-11:] To hold that things proceed from a cause which would be superior to the Good and yet which would not exercise some force upon them is a strange view, for thus it would forfeit its title to the name of cause. For some thing must in every case pass over from the cause to the effect; and especially is this true of the first cause, from which all depend and through which each being is. But if things participate in this supposed superior cause, as they have in the Good, . . .

[23, 26, 28-32:] Or else [the unparticipated] will give something of itself, which the receiver participates, while what is given is constituted as a participation. But every participation, becoming a property of that which participates it, is secondary to that which in all is equally present and has filled them all out of itself.

[188, 164, 5-6:] Any participation gives to the participant either itself or some part of itself: unless it furnished one or the other, it would not be participated.

In the light of those quotations, the participational process terminates in the perfection participated somehow becoming literally a part of the participant.<sup>7</sup> Its terminus is not solely the likeness or resemblance that the latter has to the source of the perfection. Neither is it any sort of presence within the participant of the perfection. Rather, the participation is so present as somehow to be an integral part of the participant. The process contributes to its very constitution.

A final point remains to be made. How widespread is participation in Proclus' universe? What existents are constituted by it? How many are composites of participant/participation(s)? Absolutely all, except the One or Good (4. 4. 9 sq.; 8. 8. 29 sq.).<sup>8</sup> Even though the Monad of each series lower than The One (e.g., The Intelligence with respect to intelligences, The Soul with respect to souls, and so on) is itself described as Unparticipated in relation to members of its own series (101. 90. 17 sq.), still each is the source of participations received in and, thus, fashioning those members (63. 60. 1 sq.). Moreover, each such monad, as well, of course, as each member in its series, participates the One (100. 90. 1 sq.).<sup>9</sup> The Proclus cosmos is, then, permeated by participation from top to bottom.<sup>10</sup> Beings participate henads (props. 138, 162); intelligences participate beings and, through them, henads (props. 161, 163); souls participate intelligences and, through them, beings and henads (props. 164, 202); sensible bodies participate souls and, through them, intelligences, beings, and henads (props. 129, 165).

Such seem to be the points on participation as a process that are necessary to know as a key to understanding the structure within which Proclus fits being, and as a preparation for discussing the genesis of the participations and of the participant. It is a process by which a perfection comes to be present within the participant, which it thereby completes and fulfills as a constitutive part. It directly affects all existents except The One and matter.

Now on to the discussion of origins.

### THE ORIGIN OF PARTICIPATED PERFECTIONS

There are at least two key texts in the *Elements* on how participations originate, the first of which is Proposition 23. As depicted in passages immediately adjacent to it, Proclus' universe is made up of four strata of reality: bodies, souls, intelligences, and henads (20. 22. 1 sq.).<sup>11</sup> Each stratum has at its head an existent from which it has proceeded, to which it reverts, upon which it depends, and which is called its "monad" (21. 24. 1 sq.). Thus, bodies are headed by Nature (= the World Soul), souls by The Soul, intelligences by The Intelligence, and henads by The One (21. 24. 22 sq.). Just as one stratum transcends another (e.g., souls are prior to bodies, intelligences to souls, henads to intelligences), so too their monads transcend one another. Thus, The One is beyond The Intelligence, which, in its turn, is beyond The Soul, which is beyond Nature (20. 22. 1 sq.).<sup>12</sup> Each of these monads is unparticipated—that is, "it is common to all that can participate and is identical for all and, hence, it is prior to all" (23. 28. 5–7).

It is of these monads, these unparticipateds, that Proclus speaks in the first key passage.

[23. 26. 22–32:] Every unparticipated produces out of itself participations, and all participated hypostases tend upward to unparticipated realities.<sup>13</sup>

For on the one hand the unparticipated, having the status of a monad (as being its own and not another's, and as transcending the participants), generates what is capable of being participated. For either it must remain fixed in sterility and isolation and so lack a place of honor; or else it will give something of itself, which the receiver participates, while what is given is constituted as a participation.

On the other hand, every participation, becoming a property of that which participates it, is secondary to that which is equally present in all and has filled them all out of itself.

What can be offered as comments on those lines? Clearly, they are a broad affirmation that participations are caused by an unparticipated monad and they provide information both on the cause and on the participations. The monad causes them *from itself* ("produces out of itself," "will give something of itself"). Their origin from within the cause is somewhat intelligible in view of the fact (gathered from immediately subsequent propositions) that production of effects comes about because the cause is perfect (25. 28. 21 sq.): it has complete and superabundant power (27. 30. 25 sq.). Despite this self-bestowal, though, a cause remains steadfast and immobile while producing (26. 30. 10 sq.); consequently, it is not depleted or rendered imperfect by its causality (26. 30. 22). The fact that the monad is common to all and yet transcends all (23. 28. 5)<sup>14</sup> accounts for its being unparticipated; but the fact that it is the source of participations enables one also to say that it is participated mediately.<sup>15</sup>

On the other hand, the participations become constitutive parts of the participants and, thus, are less perfect than the unparticipated (23. 26. 31), although they generally are more perfect than the participant that they fill and complete (24. 28.

8). As immediate effects of a monad, they simultaneously remain in it, proceed from it, revert to it (props. 30, 31, 35).

In the second capital text Proclus qualifies the earlier statement by adding that the participations that an unparticipated causes are of two sorts.

[63. 60. 1 sq.:] Every unparticipated produces two orders of participations, the one in things which participate only for a time, the other in things which participate always and connaturally.<sup>16</sup>

For what is always participated is more like the unparticipated than what is participated for a time only. Consequently, what is everlastingly participated will be set up before what is only intermittently participated, since the former *qua* everlasting is more akin and like the unparticipated, although *qua* participation it does not differ from the for-a-time-only participation. These intermittent participations are not, then, the sole class of participations, since prior to them are the everlasting and continuous participations, through which they too are linked with the unparticipated in an ordered sequence of procession. Nor are the everlasting participations the sole class, since they have an inexhaustible power (because they are eternal) and thus are able to produce others—namely, the intermittent participations.<sup>17</sup> With these, though, downward production ceases.

From this it is apparent that the unities with which The One irradiates beings are participated, some enduringly, others for a time; and in like manner intellectual participations are of two kinds, and the ensoulments produced by souls, and similarly the participations of Forms too.

Obviously, Proclus describes the two kinds of participations through their participants. This is his methodology because, as he states in later propositions, participations are known through what participates them (123. 108. 25–27; 123. 110. 4 sq.; 162. 142. 1–3) and this because the differences in participants arise from differences in the perfections participated (142. 126. 1 sq.). But (to return to prop. 63), there are two kinds of participants: the continuous and the intermittent. Therefore, we know there are two kinds of participations caused by the unparticipated. Proclus adds the important detail that the constant, everlasting participations cause the intermittent ones (63. 60. 10–12), which accordingly the unparticipated causes mediately.<sup>18</sup>

Have we any additional information on those participations? Yes, if we interpret Proposition 64 as restating its predecessor. Although this interpretation has the authority of E. R. Dodds,<sup>19</sup> reflection after initially publishing this paper in 1966 has led me to work out another interpretation. But before setting forth this more recent exegesis, let me indicate what (following Dodds) I had written previously and which is still informative.

What Proposition 63 described as enduring, continuous participations (hereafter, "the first sort") and as intermittent ones (hereafter, "the second sort"), proposition 64 depicts as hypostases complete in themselves and as irradiations that have their hypostasis in something other than themselves (64. 60. 20–22) because they are incomplete in themselves (*ibid.*, 1. 26). The first sort "make the participants belong to them, for being complete they fill the participants with themselves and establish them in themselves, and for their hypostasis they have no

need of inferior beings" (*ibid.*, lines 28–31). The second sort "belong to their participants, for being incomplete they require a substrate for their reality" (*ibid.*, lines 26–28).

The participant of this latter kind can exercise such strong influence because they are simultaneously participating participations of the first sort (but issuing from a monad of a lower sort than that from which the irradiations proceed). These participations, of course, fill those participants with themselves, establish them in themselves and, thus, constitute them as independent existents capable of receiving irradiations from higher monads. Thus, a demon is fundamentally constituted by the soul and intelligence it participates (= first sort of participations). But as so set up, it can also receive an occasional irradiation from the henad participated by that soul and intelligence.<sup>20</sup> That irradiation is a participation of the second sort—a unity "with which The One irradiates beings [but] participated for a time only" (63. 60. 13–14), a unity that is incomplete in itself and that belongs to the demon providing it a temporary substrate (64. 60. 26–28). Similarly, a human soul is basically constituted by the soul it participates but, as so constituted, it can also receive intermittent irradiations from an intelligence. A plant, once constituted by participating life, also receives irradiations of soul. In brief:

[64. 62. 5–12:] It is apparent that some henads proceed self-complete from The One, while others are irradiated states of unity; that some intelligences are self-complete entities, while others are intellectual perfections; that some souls belong to themselves, while others belong to the ensouleds as mere phantasms of souls. And so not every unity is a god but only the self-complete henad; not every intellectual property is an intelligence but only those whose proper reality is to be such; not every irradiation of Soul is a soul but there are also reflections of souls

Such, then, is the information with which Proposition 64 complements Proposition 63 when the two are read (following Dodds) as making the same points. Before setting forth our more recent approach to them, let us first discuss three other Propositions (81, 9, and 10) that illumine them somewhat.

Proposition 81 helps clarify Proposition 63, especially with respect to the intermittent participations that a monad produces. In interpreting Proposition 81, let us use one of the examples from the penultimate paragraph: a human soul in relationship to The Soul it continuously participates and to the intelligence that intermittently irradiates it. Considered in itself, that intelligence is a participation of the first sort because it has filled its direct participant with its own store of unity, intelligibility, intelligence (coming to it from a henad, being, and the Intelligence—[163. 142. 9 sq.; 175. 152. 19 sq.]) and, accordingly, is a hypostasis complete in itself. But it also is participated by a human soul occasionally and without directly becoming a part of it. It is, in this context, a "separate" participation."

Now to Proposition 81:

[81. 76. 12–21:] Every perfection which is participated separately [in our example, the intelligence] is present to the participant [the human soul] through a power which

is inseparable from [= immanent to] the participant and which the participation [the intelligence] implants there.

For if it is itself something separate from the participant and not contained in it, something which has its own hypostasis, then they need a mean term to connect them, one which more nearly resembles the participation than the participant does and yet actually resides in the latter. For if the former is separate, how can it be participated by that which contains neither it nor any emanation from it? Accordingly, a potency or irradiation, proceeding from the participation [= the intelligence] to the participant [= the human soul], will link the two; and this power will be that through which the process of participation occurs and will be other than the participation and the participant.

This Proposition emphasizes several points seen previously. Through the participational process a perfection comes to be present in the participant and becomes a part of it. This happens either directly or mediately—that is, through a power and irradiation which the directly participated perfection causes. Rather obviously, the direct and indirect participations are identical with the first and second sorts of participants encountered in Propositions 63 and 64.<sup>21</sup>

As a final clarification, let us review what our author says concerning self-sufficiency (props. 9–10). How does what is self-sufficient (τὸ αὐταρκές) differ from what is not? The former furnishes well-being to itself, the latter needs another's help; the former has the cause of its goodness present within itself, the latter has its cause separated from it: it needs an extraneous cause and receives the completion of its reality and activity from without (9. 10. 18–23). Both are good through participation; yet the former has its goodness from and in itself, the latter from another (*ibid.*, lines 25–28). Consequently, "what is self-sufficient in entity or activity is superior to what is . . . dependent upon another entity for the cause of its perfection" (*ibid.*, lines 14–16). Yet, although it has its good from and in itself, still the former does participate and is filled with goodness and, thus, is inferior to The Good (10. 10. 29–34).

What relationship do Proclus' remarks on self-sufficiency have with Propositions 63 and 64? Both sets appear to be affirming the same thing from different points of view. For the self-sufficient to furnish well-being to itself, to have the cause of its goodness present within itself, to have its good from and in itself, does not eliminate The Good (and whatever other monad may be involved) as the source and cause of the perfections participated since what is self-sufficient, as well as what is not, *is a participant*. Nor does it exclude the fact that the participated perfection is a part of what is self-sufficient, as well as of what is not: both participate perfections which, consequently, help constitute them. Rather, the question is, How do those perfections pertain to them? If directly and immanently, the existent is self-sufficient. If indirectly and extrinsically, the existent is not: it does not have the perfection itself but an irradiation and power from it, with the result that the existent depends upon that separate perfection as a factor in its *intrinsic* makeup.

In this interpretation, then, the self-sufficient is equivalent to the first sort of

participation: a perfection everlastingly participated, having its own hypostasis and dominating the participant it fills and establishes with itself. What is not self-sufficient is identical with the second sort of participation: the power or irradiation of a perfection intermittently and mediately participated and having a hypostasis and substrate in another, which dominates it because of its incompleteness.<sup>22</sup>

Thus far, these paragraphs have disclosed my initial reading of Propositions 63 and 64, complemented by information from Propositions 81, 9, and 10, according to which each is describing the same two sorts of participations in different words. That is to say, the unparticipated monad causes two sorts of participations—the first directly, the second through the first. The first is constantly present to its participant, which it fills with itself and thus dominates; it is a self-complete and self-sufficient hypostasis, having the perfection in question as an immanent cause. The other is a mere irradiation or power issuing from the former and intermittently received by a participant that provides it a substrate and which, thus, dominates it. Its participant is also a participation of the first sort, but one caused by a monad of a series lower than that from which the irradiation arises.<sup>23</sup> Properly understood, then, a participation of the second sort is both caused by and received in participations of the first sort. Perhaps Diagram One will help.<sup>24</sup>

Diagram One

If Props. 63 and 64 present the same doctrine, then:

- |                                   |                             |
|-----------------------------------|-----------------------------|
| #63:<br>participations are        | #64:<br>participations are  |
| a) permanently in the participant | a) self-complete hypostases |
| b) transiently in the participant | b) in other hypostases      |

This resultant arrangement:

\*In the second portion of this Diagram, "O" stand for The One, "o" for a henad, "B" for The Being, "b" for a being, "N" for The Intellect, "n" for an intellect, "S" for The Soul, "s" for a soul. The arrows in each horizontal series indicate that its members are produced by the monad without participation occurring. The dotted vertical lines indicate that each existent in those lines is produced through participation—e.g., The Being participates henad #1. The Intellect participates in henad #2 and being #1.

There is, however, another way of interpreting Propositions 63 and 64, according to which the latter Proposition divides participations (= participated perfections) into existents that are self-complete hypostases and those that reside in hypostases other than themselves, whereas Proposition 63 lists two subdivisions of this second sort of participations by positing that these other-completed hypostases are found in their participants either permanently or intermittently. In this interpretation the initial members of each horizontal series of existents are not participated in by anything; for example, in Diagram Two such members are henads 1 to 12, Being and beings 1 to 2, Intellect and intellects 1 to 2, Soul and souls 1 to 2: all of these are self-complete hypostases.<sup>25</sup> The subsequent members of each horizontal series are other-completed hypostases (e.g., henads 11 sqq., beings 3 sqq., intellects 3 sqq., souls 3 sqq.) and this residence in existents other than themselves can happen (in the light of Prop. 63) either permanently or intermittently.

Diagram Two

If props. 63 and 64 do not represent the same doctrine, then:

- |  |   |
|--|---|
| #64:<br>participations are               |   |
| a) self-complete existents or hypostases | } self-sufficient (Props. 9-10)             |
| b) in other hypostases                   |   |
| #63:                                     |   |
| 1) permanently in participant            | } self-constituted (prop. 40)               |
| 2) transiently in participant            |   |
|  | } not: self-sufficient and self-constituted |

This resultant arrangement:

Such, then, are two possible and plausible readings of Propositions 63 and 64, which deal with how the participations themselves arise. Each has advantages. But one's personal preference for one or the other interpretation does not essentially affect one's understanding of the propositions in which Proclus discloses how the participants themselves are produced. To these let us now turn.

## THE ORIGIN OF PARTICIPANTS

Proposition 72 is the first of three capital texts on the participant and its genesis.

[72, 68, 17–29:] In the participants whatever has the position of substrate proceeds from more complete and more universal causes.

For the cause of more effects is more powerful, more universal and nearer to The One than the cause of fewer. But whatever sets up the prerequisite substrates for others is the cause of more since they preestablish suitably receptive conditions even for the presence of forms. Hence, those characteristics of the substrates are, as found in causes, more universal and complete.

From this it is apparent why matter, taking its origin from The One, is in itself devoid of form: and why body, even though it participates Being, is in itself without participation in soul. For matter, which is the substrate of all, proceeds from the cause of all;<sup>26</sup> and body, which is the substrate of ensoulment, is derived from a principle more universal than soul in that after its fashion it participates Being.

The point Proclus is trying to make in these lines is rather awkwardly expressed. Perhaps seeing them in their immediate context will help. In propositions 70 and 71 Proclus moves from cause to effect, from the source to participations and participants: "A higher cause begins to operate upon secondary existents before a lower cause, is present concomitantly with the presence of the latter, and is still present and operative when the consequent has ceased to operate" (70, 66, 14–16). Consequently, the irradiations<sup>27</sup> from a higher cause are present in the participant before those issuing from a lower cause and remain there after those from a lower cause have withdrawn (*ibid.*, lines 11–13). As a result, the irradiations proceeding from a higher cause become a kind of substrate for those from a lower cause, which they receive and ground: "There is thus an order of precedence in the participative process: the same recipient is bombarded by successive rays from above, the more universal causes affecting it first, and the less universal ones supplementing these by the bestowal of their own gifts upon the participants" (71, 66, 30–68, 8; also see *ibid.*, lines 12–16).

In Proposition 72 our author seems to move from effect to cause in that from knowing what a substrate is, one also knows what sort of cause it has. The cause of more effects is more powerful and more universal than the cause of fewer; but the cause of what serves as a substrate is the cause of more effects than the cause of what the substrate receives; therefore, the cause of a substrate is more powerful, more universal, and higher than the cause of what perfects the substrate.<sup>28</sup>

What is especially important and relevant is that in Proposition 72 Proclus speaks of matter, which is the absolutely first substrate, and which is participant only and not a combination of participant/participation, such as is any material body. And on this point he is clear. Prime matter comes from The One. That which is the substrate of all comes from the causes of all. Although an inanimate body is without soul, still it participates being and, thus, originates directly from Being.<sup>29</sup> But matter, because it is without form and being, originates from that

which is above form and being.<sup>30</sup> Or, as he says elsewhere, that which merely is suitable receptivity for participation of causes (39, 42, 4–5),<sup>31</sup> and which is the privation of forms, comes from the Good (57, 56, 36–37). What is actually one but is only potentially being does not have as its cause Being but The Not-Being which is superior to Being and which is one (138, 122, 17–20).<sup>32</sup>

Perhaps Diagram Three will help.

Diagram Three

AIM: To show the extent of causality in Proclus' universe  
how far down causality of various Monads extends;  
how permeating it is.

THE ONE-GOOD-LIMIT, from which all else comes  
the henads

\*To understand how extensive the One's causality is in Proclus' universe, it helps to conceive Diagram Three as tridimensional. Also, the line,  $a^1 Z a^2$ , marks the outside boundary of the One's causal overflow, which also extends throughout the entire intelligible and physical universes and (so to speak) lies under the causal contribution of Being (i.e.,  $b^1 Y b^2$ ) and of other lower monads. *Re* the right-hand column in the diagram: the second stage of a segment in the column is identical with the first stage of the following segment—e.g.,  $b^1$  is equivalent to  $a^2$ ,  $c^1$  to  $b^2$ , and so forth. The segments  $d$  and  $e$  are incomplete because Proclus seems not to have spoken of them in detail in the *Elements*.

The second key text, which is a composite of relevant lines from propositions 99 and 100, speaks of both participants and participations, although not without ambiguity.

[99, 88, 20–34:] Every unparticipated arises *qua* unparticipated from no cause other than itself but is itself the first principle and cause of all participations [in its series]. Thus the first principle of each series is always without origin.

For if it is unparticipated, it has primacy in its own series and does not proceed from other principles, since if it received from an external source that character in respect of which it is unparticipated, it would no longer be first in that series. If it is inferior to others and proceeds from them, it proceeds from them not *qua* unparticipated but *qua* participant. For those principles from which it has taken its rise are of course participated by it, and the perfections which it participates, it does not possess primally; but what it is as unparticipated, this it is primally. Accordingly, *qua* unparticipated it is uncaused. *Qua* caused it is a participant," not unparticipated; *qua* unparticipated, it is a cause of participations and is not itself a participant of others.

[100, 90, 2–3 and 7–16:] All unparticipateds are dependent from the one First Principle of all things. . . .

All the unparticipated monads are referred to The One because all are analogous to The One. . . . In respect of their common origin from the latter, none of them is a first principle but all have as their first principle The One;<sup>14</sup> each, however, is a first principle *qua* unparticipated. As principles of a certain order of things they are dependent from the Principle of all things. For the Principle of all things is that which all participate, and this can only be the primal cause; the rest are participated not by all but by a certain some. Hence also that cause is absolutely The Primal, while the rest are primal with respect to a certain order but when considered absolutely are not primal.

These lines seem in obvious contrast with the first key text of this section. In Proposition 72 Proclus is concerned almost solely with participants and views the universe from the bottom up, so to speak. Here, though, he is concerned mainly with monads as unparticipated and his remarks on them as participants are almost incidental (and, certainly, somewhat ambiguous). He views the universe here from the top down.

In what does that ambiguity consist? It centers around the second point noted here.) Precisely as unparticipated, a monad causes and explains itself. This self-causality appears not to be identical with self-sufficiency (props. 9–10) and self-constitution (prop. 40 sq.), since what is self-sufficient and self-constituted do participate. In fact, these latter *are* participations that are self-causing only insofar as the perfection participated is itself present within them and not a mere irradiation from it. But a monad is self-causing and -explaining precisely because the perfection that is uniquely its own and that it contributes as participations to the series it heads (e.g., beingness re Being, animation re Life, etc.) is from itself—it is not received as a participation from an external source but originates from within. Otherwise, it would not be first in that series, it would not be the source therein of those unique participations. 2) Accordingly, if "it is inferior to others

and proceeds from them, it proceeds from them not *qua* unparticipated but *qua* participant." This is the ambiguous sentence. Conceivably, something can be caused as a participant because it receives participations from its cause or, secondly, because as prior to and a substrate for those participations, it itself arises also from that cause.

Which meaning does Proclus intend here? It is difficult to decide, although the words immediately subsequent to those just quoted seem to point to the first: "it proceeds from them . . . *qua* participant, for those principles from which it has taken its rise are of course participated by it, and the perfections which it participates it does not possess primally." But Proposition 100 provides material for an inference pointing to the second meaning. All unparticipated monads are dependent upon and ultimately reduced to The One, their common origin and First Principle. Their procession from it as participants can hardly be solely with respect to the participations they receive from it since such participations are absolutely primal and would, in this supposition, be without any participant at all. A participation can help provide a substrate to a subsequent participation (71. 66. 30 sq.), but it can hardly be a substrate *to itself*. Consequently, all other unparticipated monads (and, of course, the series they initiate) proceed as participants in the sense that the One establishes them prior to any participations and causes in them what serves as a substrate for all participations—namely, that which Proposition 72 calls "matter," the underlying receptacle for all perfections, the privation of and desire for all forms, what is actually one but is merely potential being, what is in itself an indeterminate and infinite power looking to future development (props. 90–92; refer again to Diagram Three).

The final text discloses the role each henad or god plays with the One in respect to the participant.

[137, 120, 31–122, 6:] Each henad co-operates with The One in producing its own participant.

For as The One is constitutive of all, so it is the cause both of the participations which are the henads and of the beings dependent upon them. At the same time each henad produces and irradiates its dependent. The One makes each dependent be, simply; the henad makes each be of the same nature as itself." Thus, the henad imposes its own determinate character upon the being participating in it, in which it entitatively displays its own supra-entitative property.

Earlier (props. 120–122) Proclus had spoken of the gods as causes of participations. An agent's activity parallels and conforms to his nature or reality; but a god by nature is not an intelligence but a prior-to-intelligence, is not a being but a prior-to-being; he *is* goodness; consequently, his activity is not intellection but a function prior to intellection (τὸ προνοεῖν) and to being (τὸ προεῖναι): the bestowal of goods upon subsequents, the communication of participations upon participants (120. 104. 31 sq.). These participations each henad bestows without itself assuming any relationship to the participants, without itself becoming dependent on them (122. 108. 13–17). Moreover, that bestowal occurs spontaneously, naturally, inevitably, necessarily since

it is in virtue of being what they are that they make all things good. . . . By their very being or, rather, by their very priority to being, they irradiate goods upon beings. For being nothing but goodnesses, they furnish by their very being goods to all without stint [*ibid.*, lines 14–17, and 6–11].<sup>36</sup>

In proposition 137, though, our author speaks of the gods with reference to the participant itself. Working together with the One, the henad helps cause the being which immediately participates it (135. 120. 1 sq.) by making it be con-natural with itself, by manifesting on the level of being the character that it has supraentitatively and primally. Thus, a “paternal” henad implants paternity in its being-participant (151. 132. 26 sq.), a “generative” henad implants generativity (152. 134. 6 sq.), and so on down the line of the other henadic characters spoken of in Propositions 153–158.<sup>37</sup>

On the other hand, while a god makes its participant “be of the same nature as itself,” The One “makes it be simply.” What does that striking statement mean? First of all, our author does not intend that The One makes it be *being*: such is the function of The Being. This latter monad accounts for the presence of form in matter (57. 56. 12–13) or, in other texts, of limit in infinity (89. 82. 1 sq.; 102. 92. 1–2, 7–8), and such is “being”: a combination of form/matter, of limit/infinity. But The One brings it about that what as yet is merely potential being not only is actually one (138. 122. 17–18), but also *is* simply. Does this signify that The One causes matter, the absolutely primal substrate, the participant of henads (and ultimately of all else, too), to *actually exist*? I think not, because every effect in Proclus’ universe is, at bottom, identical with its cause: although an effect proceeds from and thus is somehow distinct from its cause, still it also remains in, and thereby is the same as, its cause (30. 34. 12 sq.). Causality consists in the higher deploying *itself* on a lower level, where it is less perfect and more multiple than before, but where it remains itself under the camouflage of imperfection and multiplicity.

Apparently, matter would be no exception to this general rule. Radically, it *is* The One descending to a lower and pluralized level. It *is* The One emerging into evolving cycles of explication and differentiation. We can say that The One, in contrast with the henads, makes matter *be* simply insofar as under its influence what we call matter comes to deploy on a lower level, which the henads then make connatural to themselves and, thereafter, fill with themselves. In this interpretation, then, “to be simply” is not “to actually exist” since this latter demands that what now is, before was in no way. Accordingly, Proclus appears not to have had a genuine doctrine of creation. Not only does The One produce necessarily rather than voluntarily and freely, but the product is not really distinct in any genuinely adequate way from the producer and, therefore, the product is not caused to actually exist. That which is now *where* it was not before, is now in a different state and under a different guise than it was before, is now different from *what* it was. But that which now is *was* before. The One no more causes it to exist then or now than it causes itself to exist.<sup>38</sup>

## SUMMARY AND CONCLUSION

Despite this seeming lack of a doctrine of creation, though, Proclus’ *Weltanschauung* as outlined in *Elements of Theology* is not a mere cosmology but a genuine cosmogony. At the head of each stratum of reality within the universe stands an unparticipated monad which is the cause of all participations within its stratum. In Dodd’s (and my earlier) interpretation, these are either constantly participated perfections (which are self-complete and self-sufficient hypostases and are causes immanent to their participants), or they are perfections only intermittently participated (which are mere powers or irradiations issuing from the former and which have their hypostases and substrates in their participants) (see Diagram One). In my more recent interpretation, though, the two sorts of participations just mentioned express two ways in which participations reside in other-completed hypostases and are contrasted with those that are self-complete existents or hypostases (see Diagram Two).

In either interpretation one must face this question: Where does the monad itself acquire those perfections? From itself. With respect to the characteristic which is uniquely its own and which is the basis for the unique participations it bestows upon all members of its series, it is primal, it is unparticipated, it has no external cause.

With the exception of The One, though, every monad (as well, of course, as the members of its series) is a participant with reference to higher monads, whence it receives not only participations but also derives its status as participant. In the last analysis, all else has proceeded from and reverts to The One, which is the primal monad and which is unparticipated without itself being a participant of anything higher. It causes matter the underlying stuff of all substrates to be simply; not by making it actually exist, but by that which is absolutely one and totally perfect stepping down onto levels of gradually increasing multiplicity and imperfection.

In Proclus’ cosmos then, there are at least two sorts of causality operative, both of which are spontaneous, natural, necessary. The one (= vertical) is a process of participation: participations come to be present in participants, which they complete and perfect as integral parts. The other (= horizontal) is not: the participations themselves and their participants originate simply (and mysteriously) by proceeding from their monads.<sup>39</sup> There issues from the two causalities a tightly structured hierarchy of reality stretching from the One-Good-Limit at the top to matter, the deployment of the One itself at the very bottom.

## ON LOGICAL STRUCTURE AND THE PLOTINIC COSMOS

1. A. E. Taylor, *Plato, the Man and His Work* (London: Methuen, 1963, first published in 1926), p. 293.
2. The translation used throughout is that of MacKenna. Namely, Plotinus, *The Enneads* translated by Stephen MacKenna. Second edition (London: Faber and Faber, Ltd., 1917–1930).
3. See especially the author's *Whitehead's Categoreal Scheme and Other Papers* (The Hague: Martinus Nijhoff, 1974), especially chapter 1.
4. On virtual classes and relations, see especially the author's *Belief, Existence, and Meaning* (New York: New York University Press, 1969), chapter 6, and *Semiotics and Linguistic Structure* (Albany: The State University of New York Press, 1978), chapters 1 and 2.

## SOME LOGICAL ASPECTS OF THE CONCEPT OF HYPOSTASIS IN PLOTINUS

1. The general view is that there are three hypostases: One, *Nous*, and Soul. A. H. Armstrong, in his "Introduction" to the Loeb edition of Plotinus' *Enneads* (London and Cambridge, Mass.: Harvard University Press, 1966) vol. I, p. xxii, suggests that nature is a fourth distinct *hypostasis*, although

- Plotinus "is reluctant to admit it." In his earlier work, *The Architecture of the Intelligible World in the Philosophy of Plotinus* (Cambridge: Cambridge University Press, 1940), p. 102, Armstrong proposed five Plotinian hypostases: One, Nous, Soul, Logos, and Nature; he states that "The Logos is a fourth hypostasis even more clearly than nature, and a hypostasis, moreover, whose own structure is complex." John M. Rist, in his *Plotinus: The Road to Reality* (Cambridge: Cambridge University Press, 1967), especially in chapter 7, argues against Armstrong and takes the view that there can be only three hypostases; so also John N. Deck, *Nature, Contemplation and the One: A Study in the Philosophy of Plotinus* (Toronto: University of Toronto Press, 1967), p. 56, but seems rather uncertain about excluding nature, p. 66. R. T. Wallis appeals to *Enneads* II. 9. 1. 57–63, to indicate that in Plotinus' view "Logos is not a separate Hypostasis but expresses the relation of an Hypostasis to its source, its products, or both, cf. III. 2. 2. 15ff." *Neoplatonism* (New York: Charles Scribner's Sons, 1972), p. 68. For Plotinus' own testimony that the primal hypostases are (i) three, see V. 1. [10] 1; and (ii) only three, II. 9. [33], 1–2: One, Nous, and Soul.
2. There are key passages in the *Enneads* which refer to the basic features of *hypostasis*, and we may single out four: (i) as power a *hypostasis* is infinite and nonspatial (VI.3.8. 35ff; VI.9.6. 10–12); (ii) *hypostasis* remains unaffected by what it produces, and as such it is "undiminished giving," suffering no diminution of substance (III.8.46–48 and 10.1–19); (iii) a *hypostasis* creates without inclination, will, or movement (V.1.6.25–27; V.3.12. 20–29; (iv) a *hypostasis* has no knowledge of its products; the One qua *hypostasis* transcends knowledge altogether (VI.7.39. 19–33); yet the lower hypostases know only the causal principles they contain within themselves (IV.4.9. 16–18; V.8.3. 26–27). See also Wallis, *Neoplatonism*, pp. 62–63.
  3. Deck, *Nature, Contemplation and the One*, pp. 9–11.
  4. *Ibid.*, p. 9. John Rist follows a somewhat different formulation from Deck, who appeals to demonstrate from causality. His understanding that the One is the first hypostasis is stated as follows: "The One does not concern itself. But the result of willing itself is its production of the second hypostasis, for it wills itself to be such as to produce it. Creation is as free, no more and no less, than the One itself. As for pantheism it is irrelevant." See his *Plotinus*, p. 83. While Deck emphasizes the argument from cause to establish the One as *hypostasis*, Rist stresses the ontological analysis of the nature of the One qua "willing itself."
  5. Deck, *Nature, Contemplation and the One*, p. 66. His meaning, however, is not made clear.
  6. Deck's claim that the titles are Porphyry's own seems to rest on his misreading of the text. See Porphyry, *On the Life of Plotinus*, ch. 4, in *Enneads* (Loeb edition) vol. I. Porphyry does not say that he supplied the titles, only that he used the ones that had prevailed: "These were the writings, to which, since he gave them no titles himself, each [of the few people who had received copies] gave different titles for the several treatises. The following are the titles which finally prevailed. I add the first words of the treatises, to make it easy to recognize from them which treatise is indicated by each title" (Armstrong's translation [Loeb edition], vol. I, p. 13). The word for title is *epigraphē*. See also, Porphyry, ch. 25, 32–37.
  7. Armstrong's translation of the title Porphyry preserved: Περὶ τοῦ ἔκουσίου καὶ θελήματος τοῦ ἑνός, (ch. 26 [Loeb edition] vol. I, p. 85).
  8. E. Bréhier's text. Plotin, *Ennéades*. (Paris: "Les Belles Lettres," 1924–38), vol. VI<sup>2</sup>, p. 153.
  9. S. MacKenna, *The Enneads*, English translation, 3rd edition revised by B. S. Page (London: Faber and Faber, 1962), p. 608.
  10. Compare III.8.10, where Plotinus speaks also of life as founded in "roots": οὐκ ἐν ῥιζῇ λόγουμένης.
  11. Wallis claims that "Plotinus' aversion to formal systems . . . is shown by his continual qualification of his accounts of spiritual being by such Greek works as *hoion* or *hospēr* ('so to speak')" (*Neoplatonism*, p. 41). Evidently, Wallis questions the possibility that *hoion* is a technical expression. If Wallis's claim is granted, then all conceptual terms used by Plotinus to explicate the One are reducible to "so-to-speak" expressions. It may be objected that the expression "so to speak" is too weak to render Plotinus' meaning or capture the seriousness of his arguments and the tone of his exposition. There is an important passage where the expression *to hoion* is used in a conspic-

uously technical sense: VI.8.11. Plotinus states there that for the whole inquiry to determine the meaning of μὴ ὑποστάν as related to "the question just raised," we need to think of the following concepts: ἢ τοῦ τί ἐστὶν εἶναι ἢ τοῦ οἷον ἢ τοῦ διὰ τί ἢ τοῦ εἶναι. After stating what the last two mean, he says that τὸ δὲ οἷον ἐστὶ ζῆτεῖν τί συμβέβηκεν αὐτῷ ὥ συμβέβηκεν μηδὲν (lines 9–10).

12. For comparable examples of the use of *hoion*, see VI.8.7.31–32: Ὑπὲρ δὴ ταῦτα τοῦ ἀγαθοῦ αὐτοῦ ὄντος οἷον ἄλλο παρ' αὐτὸ ἀγαθὸν ζητεῖν ἀτοπον. A comparative study of the uses of *hoios* in the Platonic texts may prove useful on this point. See, for instance, *Ion* 537C and 538A and also *Gorgias* 454D.

## THE ONE, OR GOD, IS NOT PROPERLY "HYPOSTASIS": A Reply to Professor John P. Anton

1. See pp. 24–33 of this volume. The article was also previously published in *The Review of Metaphysics* 21:2 (December, 1977), pp. 258–271; hereafter, "Anton." All page references are to the *Review* article.
  2. John N. Deck, *Nature, Contemplation and the One* (Toronto: University of Toronto Press, c. 1967); hereafter *NCO*.
  3. Professor Anton is, of course, aware of this doctrine—too obvious to be missed—from his own reading of Plotinus. But he does not appreciate its overriding significance. "Though the One is beyond *ousia* and thus beyond predication, still it is the case that he [Plotinus] makes it the object of discourse" (Anton, p. 25). There seems to be here scarcely a suspicion of the adjustments required when a philosopher makes the "beyond predication" an "object of discourse." The absence of this whole dimension makes it possible for Anton to write an entire article demonstrating that "correct discourse" about the One "demands" that the One *is something*—in this case, that the One *is the first hypostasis*! (Anton, p. 33—Conclusion).
  4. Professor Anton does not attend sufficiently to the doctrine that the One is not dual: "The One gave itself its own subsistence and necessarily so" (Anton, p. 31); ". . . the original activity of the One which is presupposed by its *ousia*" (p. 33; ". . . in control of itself" (p. 30). These and similar phrases are quoted or supplied by him absolutely without correctives.
  5. Just as Anton did not feel the force of "beyond predication," so in the same paragraph (Anton, p. 25, para. 1) he fails to appreciate (although he quotes), "beyond being." For him Plotinus believes that it is impossible to make contradictory statements about the One because the "thesis that contradictions are not possible when we speak of Being . . . is fundamental to all classical ontology." *Beyond being*!
- (To wander much further afield, I would be prepared to defend, sometime, that the principle of contradiction (noncontradiction?) is not nearly so sacred to the Plato of the Sophist, to Plotinus, or even to Aristotle as it is to, say, Leibnitz—and also that the ordinary logical notion of contradiction is too crude, at any rate, to be of value in serious metaphysics.)
6. Professor Anton, for whom the "concept" of hypostasis is important (and apparently univocal) in Plotinus, shows concern about the *number* of hypostases, and says that they are three and only three (p. 24, n. 1). In doing so, he represents me as "being rather uncertain about excluding Nature." What I had done was virtually ■ quote Plotinus (in passing, and in another connection): "Soul, by descending into plants, makes another hypostasis" (*NCO*, p. 65, referring to V.2.1. 24–26). But I am not terribly interested in whether Nature is or is not another hypostasis. I am very interested, as Plotinus himself was, in the delineation of the sameness-and-difference, continuity-and-discontinuity, between Soul and Nature.
  7. If Plotinus were to have an *ex professo* doctrine of hypostasis (I do not see that he has), and if that doctrine were correctly rendered by Professor Anton, that is, if "*hypostasis*" were really to mean, for Plotinus, what is infinite and nonspatial, what is unaffected by what it produces, what creates *without* inclination, will, or movement, what has *no* knowledge of its products, "*hypostasis*" still would not name what the One is in its own nature. "*Hypostasis*" would connote only, and strictly

from the outside, what the One is not. It could not refer to an internal negation; the One is above that. It would be what the Scholastic textbooks used to call an "extrinsic denomination." "The One is the first *hypostasis*" would be a case of *via negationis* or *via remotionis*.

## PLOTINUS' THEORY OF THE ONE

1. "According to the time of writing—early manhood, vigorous prime, worn-out constitution—so the tractates vary in power." Porphyry, "On the Life of Plotinus and the Arrangement of his Work," from Plotinus *The Enneads*, trans. Stephen MacKenna, with an Introduction by Professor Paul Henry, S. J., 4th rev. ed., (New York: Random House, 1969), p. 5.
2. Almost all commentators have recognized at least two different ways Plotinus has of speaking of The One, though they do not characterize them in the same way always. Leo Sweeney, S. I., "Infinity in Plotinus," *Gregorianum* 38 (1957), 515–535, suggests that infinity is predicated of The One extrinsically in virtue of its *dynamis*, but intrinsically of its Non-Beingness. The non-being of the One is particularly emphasized by Jean Trouillard, "Plotin et le Moi," *Horizons de la personne*, eds. A. Jagu et al. (Paris: Les Editions Ouvrières, 1965), p. 75. John M. Rist, "Theos and the One in Some Texts of Plotinus," *Mediaeval Studies*, 24 (1962), 169–180, recognizes that while the One transcends being, it does not transcend causality. René Arnou, *Le Desir de Dieu dans la Philosophie de Plotin* (Paris: Librairie Felix Alcan, n.d.), p. 178, describes in some detail both immanent and transcendental modes of discourse in reference to The One. Another author emphasizes the One as the synthesis of both modes of discourse: "So ist das Eine die Einheit von Sein und Nichtsein, von Rationalem und Irrationalem, von Allem und Nichts." Fritz Heinemann, *Plotin: Forschungen über die plotinische Frage, Plotins Entwicklung und sein System* (Leipzig: Felix Meiner, 1921), p. 253. Finally A. H. Armstrong has emphasized recurrently both the positive and negative elements of the One in Plotinus and their incompatibility. Cf. especially A. H. Armstrong, "Platonic Mysticism," *Dublin Review* 216 (April, 1945), 130–143; and also his *The Architecture of the Intelligible Universe in the Philosophy of Plotinus: An Analytical and Historical Study* (Cambridge: The University Press, 1940), pp. 1–47.
3. *Enn.* V.5.6, p. 408. "... ἀνάγκη ἀνείδειον ἐκείνο εἶναι. ἀνείδειον δὲ ὃν οὐκ οὐσία· τότε γὰρ τι δεῖ τὴν οὐσίαν εἶναι· τοῦτο δὲ ὁρισμένον· τὸ δὲ οὐκ ἔστι λαβεῖν ὡς τότε· ἤδη γὰρ οὐκ ἀρχή, ἀλλ' ἐκείνο μόνον, ὃ τότε εἰρηκας εἶναι... οὐδὲν δὲ τούτων ὃν μόνον ἂν λέγοιτο ἐπέκεινα τούτων. ταῦτα δὲ τὰ ὄντα καὶ τὸ ὄν· ἐπέκεινα ἄρα ὄντος, τὸ γὰρ ἐπέκεινα ὄτος οὐ τότε λέγει—οὐ γὰρ τίθησιν—οὐδὲ ὄνομα αὐτοῦ λέγει, ἀλλὰ φέρει μόνον τὸ οὐ τοῦτο." 41. *Enn.* 7.32, p. 586. "οὐδὲν οὖν τοῦτο τῶν ὄντων καὶ πάντα· οὐδὲν μὲν, ὅτι ὑστερα τὰ ὄντα, πάντα δὲ, ὅτι ἐξ αὐτοῦ." *Harder*, IIIa. VI.7.32, p. 328. Cf. also *Enn.* VI.8.16, pp. 609–610; VI.2.9, p. 479.

42. *Enn.* V.5.7, p. 409. "οὔτις δὲ καὶ νοῦς αὐτὸν ἀπὸ τῶν ἄλλων καλύπτει καὶ συναγαγὼν εἰς τὸ εἶσω μὴδὲν ὁρῶν θεάσεται οὐκ ἄλλο ἐν ἄλλῃ φῶς, ἀλλ' αὐτὸ καθ' ἑαυτὸ μόνον καθαρόν ἐρ' αὐτοῦ ἐξαιφνης φανέν, ὥστε ἀπορεῖν ὅθεν ἐφάνη, ἐξωθεν ἢ ἐνδον, καὶ ἀπελθόντος εἰπεῖν <<ἐνδον ἄρα ἦν καὶ οὐκ ἐνδον αὐ>>." *Harder*, IIIa. V.5.7, p. 88.

## VERTICAL CAUSATION IN PLOTINUS

- John M. Rist, *Plotinus: The Road to Reality* (London: Cambridge University Press, 1967).
- A. H. Armstrong, "Plotinus," Part III of *The Cambridge History of Later Greek & Early Medieval Philosophy*, ed. A. H. Armstrong (London: Cambridge University Press, 1970).
- My reference to Plotinus' noumenatics must be distinguished from what I shall later call Plotinus' doctrine of the noumenal world. "Noumenatics" refers to Plotinus' contemplation, intellection and intelligible object account; "noumenal" refers to the notion found in Early Modern Rationalists. As I shall use them, the two words are closely related but they are not quite the same, as I shall distinguish between Plotinus' noumenatic account and his proper account of the noumenal world.
- My interpretation thus parts company with Rist's interpretation in *Eros and Psyche* (Toronto: University of Toronto Press, 1964). Rist recognizes in Plotinus' philosophy a hierarchy of types of persons on the road to unity with Intellect. First is the lover, a person who at least has the predilection to become unified with something other than himself. Second is the music-lover, one who studies the science of harmonics and proportions. Higher still is the lover of wisdom, whose highest study is that of mathematics (τὰ μαθήματα). Having recognized this hierarchy, however, Rist does not see any essential connection between arithmetic, and the like, and union with Intellect: "In view of the general tone of Plotinus' work and of the age in which he lived, we can attribute this continued interest in mathematics solely to Plotinus' unwillingness to diverge from the Platonic method as he knew it" (p. 90).
- Rist's conclusion is based upon his almost exclusive emphasis throughout the book on Plotinus' noumenatics. I maintain, in contrast, that music theory and mathematical training is essential for Plotinus because the concepts, proof procedures, and the like, which are thereby learned are the very means by which Intellect is to be articulated in its most basic form. As to the fact that "Plotinus does not put as much emphasis as Plato on the exact sciences" (p. 90), I refer to the closing remarks of my introduction and to the fact that, in view of the grounding which our ordinary concepts have in Intellect's structure (see page 56), Plotinus can maintain that those concepts provide a means for the "vulgar" to attain a derivative union with Intellect.
- See Leibnitz's *New Essays Concerning Human Understanding*, Book IV, chapter 3. For instance: "When one has certain confused ideas . . . as one ordinarily does, it is not to be wondered at if one does not see the means for solving [philosophical] questions. It is as I have remarked before, that a person who has not ideas of the angles of a triangle except in the way in which one has them generally, will never think of finding out that they always equal two right angles . . . and when we farther consider what belongs to the nature of [real things] . . . we are transported, so to speak, into another world, that is to say, into the intelligible world of substances, whereas before we have been only among the phenomena of the senses" Leibnitz, *Selections*, ed. Philip P. Wiener (New York: Charles Scribner's Sons, 1951), p. 464.
- Plotinus' theory of perception maintains that in performing conceptual activities on occasions of sensation, we thereby make a world of perceived objects, in a manner analogous to a craftsman using his tools to make a craft object. I shall say more about this view as I proceed, but I shall not discuss it at length or defend my interpretation of Plotinus' theory of perception in this essay.
- Given his theory of perception (see Note 6, above), Plotinus holds that phenomenal bodies are not real causes at all—not even of our sensations. Not being causes, they are not "metaphysically concrete," as it were. They are "well-founded" rather than real as such.
- Plotinus rejects a temporal or dispositional reading of capacities in *Ennead* II.5 except insofar as it is applicable in a derivative way in talk about phenomenal bodies (see Armstrong's introduction to

- that treatise in his Loeb Classical Library translation). Plotinus thus says that "this part of the [species] soul, the capacity to undergo, is not body but a certain Form" (III.6.4.31); and that "the capacity to undergo is a cause of undergoings" (III.6.4.44).
9. The distinction between undergoings and activities thus has nothing to do with the latter occurring in an immaterial entity distinct from the body in some Dualistic fashion. It is misleading at best to say, for example, that for Plotinus an "immaterial soul 'inside'" does the perceiving. See Henry J. Blumenthal, "Plotinus' Adoption of Aristotle's Psychology: Sensation, Imagination and Memory," in *The Significance of Neoplatonism*, ed. R. Baine Harris (Albany: State University of New York Press, 1976), pp. 41–58; see especially pp. 47–48.
  10. Plotinus' use of the Stoic doctrine of cosmic sympathy also has its home in the theory of vertical causation. Gordon G. Clark, for example, interprets Plotinus' doctrine of cosmic sympathy as claiming that one body can act upon another body without benefit of a connecting causal chain. Clark calls this mode of horizontal causation "action at a distance" ("Plotinus' Theory of Sensation," *The Philosophical Review* 51 (1942), p. 357–382; p. 364). But more precisely for Plotinus, the doctrine of cosmic sympathy claims that everything occurs of necessity "when" and "where" it occurs in the eternal universe and, derivatively, in the phenomenal universe. It is in virtue of this alone that one can classify one body as an agent and another as a patient without discerning an intermediate causal chain.
  11. The eternal and nonproductive (in a horizontal sense) character of what I call vertical causation is remarked on by John H. Randall in "The Intelligible Universe of Plotinus," *Journal of the History of Ideas* 30 (1969), pp. 3–16; p. 13; and, A. H. Armstrong in *Cambridge History* (pp. 252–253). R. T. Wallis gives an account of apparently similar views in Proclus to Plotinus' views on the distinction between horizontal and vertical or real causes in *Neoplatonism* (Gerald Duckworth and Company Ltd., 1972, p. 126). And Rist even proposes that what I would call phenomenal matter and noumenal matter may be distinguished for Plotinus in terms of whether or not the "matter" is being considered as being temporal or as being eternal (*Road to Reality*, p. 118).
  12. It is at this point that Proclus especially departs from Aristotle's classic account of relative-to's in *Categories*. Aristotle claims that the correlatives perception and perceptual object differ from other correlatives, like slave and master, in that they need not occur together. That is, while perceptions and actually perceived things may always occur only together, the same is not true for perceptions and perceptible objects. In short, Aristotle argues, "the perceptible holds prior to perception" (7b36). But Plotinus disagrees. The perceptual world is strictly relative to our discernments of it for Plotinus (see Note 6). Recall, in particular, Plotinus' claim that perceptible air, earth, fire, and water are not the elements called by the same names. Plotinus thereby rejects Aristotle's argument to the effect that the perceptible is prior to perception (and to the perceived as well) because the elements are prior to the perceptive animal (8a10).
  13. The idea that Aristotelian-type categories apply to the perceptual world while the Platonic categories apply to the real world is noted by Merlan in *Cambridge History*, p. 38. That Aristotelian-type categories are, ultimately, derivative from the Platonic categories for Plotinus is discussed by John P. Anton in "Plotinus' Approach to Categorical Theory" (*Significance*, pp. 83–89, esp. p. 88). I shall not discuss the precise character of this derivativeness thesis in this essay.
  14. The interdependence of Intellect's "seeing" with sameness and difference is discussed by Rist in "The Indefinite Dyad and Intelligible Matter in Plotinus," *Classical Quarterly* 12 (1962), pp. 99–107, esp. pp. 101–102. The source of Plotinus' view that real or intelligible motion is to be explicated in terms of differentiation may be Plato's *Parmenides*, where Plato defines motion as "always being in a different" (146a). The idea that the "matter" of Intellect is the Dyad is suggested by Merlan (*Cambridge History*, p. 27), and Rist identifies the Dyad in Plotinus with the very "urge to contemplate" ("Indefinite Dyad," p. 102).
  15. This analogy between contemplation and geometrical derivations is, in fact, grounded in text. Plotinus offers as a prime example of engaging in contemplation a geometer theorizing about lines (III.8.4.8–11).
  16. Plotinus thus maintains that as one proceeds from considering the contemplation of nature to that of Soul and finally to that of Intellect, the contemplation becomes more unified or simple (ἐνομήνεια) (III.8.8.1–8).

## THE ONTOLOGICAL BASIS OF PLOTINUS' CRITICISM OF ARISTOTLE'S THEORY OF CATEGORIES

1. This was only one of several titles given to the treatise, as we will see. The abbreviation CAG below stands for *Commentaria in Aristotelem Graeca*, vol. 23 (Ed. Academia Litterarum Regia Borussica, Berolini: G. Reimeri, 1882–1909). MacKenna's translation of the *Enneads* is followed here. (Plotinus, *The Enneads*, trans. by Stephen MacKenna, Second Ed., London: Faber and Faber, 1917–1930).
2. Plotinus challenges this view and relates the treatise to *Metaphysics*, as is evident from his references to this work.
3. Simplicius CAG VIII mentions the names of these commentators.
4. CAG IV. 2. 5. 16–24.
5. The characterization is Simplicius' CAG, pp. 16. 18.
6. According to Simplicius, Plotinus was the last and the sharpest critic of Aristotle's categories, CAG, pp. 2–5.
7. Also, parts of his *Isagōgē* relate to the categories, especially the sections on genus, species, and differentia.
8. From another point of view, even Plotinus could be called an Aristotelian, if Porphyry's remark that much of Aristotle's *Metaphysics* is incorporated in the *Enneads* is correct. *Vita*, MacKenna translation of *Enneads*, p. 14.
9. It is understandable that the Stoic doctrine, as more materialistic, receives Plotinus' more severe criticism.
10. Cf. *Metaphysics* 1053b; also *Physics* 689a. 11–21.
11. *Timaeus* 27d–28e.
12. *Ibid.*, 29b and 48e.
13. *Ibid.*, 48c–d.
14. *Sophist* 254c–255e.
15. As given here the "genera of being" are to be found in VI. 2, especially chapters 7 and 8. For the other genera, see VI. 3. 1–27.
16. However, even λόγος νοήτος lacks the absolute unity of the One.
17. The example is Aristotle's *Metaphysics* 1024a. 33–6.
18. *Ibid.*, 1024b. 5.
19. *Ibid.*, 1024b. 809.
20. *Topics* 102a. 32–3.
21. It is correct that Aristotle refers to categories as genera, but to my knowledge he never used the expression "genera of being."
22. *Categories* 1b. 25.
23. Porphyry CAG IV, pp. 139–140, reluctantly accepts the last four categories of the Aristotelian list.
24. Dexippus, CAG, wrote three treatises answering Plotinus' aporias on Aristotle's categories.
25. Simplicius, CAG, pp. 16–18.
26. CAG IV, pp. 56–7.
27. According to Simplicius, CAG, pp. 16–17.
28. The labeling is mine, but the commentators after Porphyry speak of these alternative interpretations as a commonplace.
29. Simplicius, CAG, pp. 11–12, for example.
30. *Ibid.*, pp. 16, 18–19.
31. Porphyry, CAG, pp. 25 30, 85; and *Isagōgē* 1a. 9–14.

## PLOTINUS AND SELF-PREDICATION

1. R. E. Allen, "Participation and Predication in Plato's Middle Dialogues," in ed. R. E. Allen, *Studies in Plato's Metaphysics* (New York: Humanities Press, 1965), p. 43.

2. This idea was developed by Sandra Peterson Wallace in "A Reasonable Self-Predication Premise for the Third Man Argument," *Phil. Rev.* 82 (1973), pp. 451-70.
3. Gregory Vlastos, "A Note on 'Pauline Predications' in Plato," *Phronesis* 19 (1974), pp. 95-101.
4. Vlastos, "Note," p. 95.
5. It seems appropriate to refer to this type of predication as epsilon predication.
6. Vlastos, "Note," p. 96.
7. Vlastos, "Note," p. 96.
8. This is also Lloyd's conclusion. Cf. A. C. Lloyd, "Neoplatonic Logic and Aristotelian Logic," *Phronesis* 1 (1955-1956), pp. 58-72, 146-60, p. 159.
9. Cf. Lloyd, "Logic," p. 62.
10. Cf. John Deck, *Nature, Contemplation, and the One*, (Toronto: Univ. of Toronto Press, 1967); R. T. Wallis, *Neoplatonism* (New York: Scribner, 1972); John Fielder, "Chorismos and Emanation in the Philosophy of Plotinus" in ed. R. B. Harris, *The Significance of Neoplatonism* (Norfolk, International Society for Neoplatonic Studies, 1976).
11. Deck, "Nature," p. 73.
12. Deck, "Nature," p. 116.
13. Wallis, "Self-Predication," p. 93.

## OMNIPRESENCE, PARTICIPATION, AND EIDETIC CAUSATION IN PLOTINUS

1. Émile Bréhier, *The Philosophy of Plotinus*, translated by Joseph Thomas (Chicago: University of Chicago Press, 1958), p. 111.
2. All references to Plotinus are to the critical edition of Paul Henry and Hans-Rudolf Schwyzler (Paris and Brussels: Desclée de Brouwer, 1951-1973). Unless otherwise indicated, all translations in this paper are those of the author.
3. On the need for appropriate principles in (scientific) inquiry, see Aristotle *Posterior Analytics* A. 2. 71b23-72a6.
4. This description clearly draws heavily from the *Timaeus*, particularly 27d5-28a4 and 52a1-b1.
5. Cf. Bréhier's "Notice" to VI. 4-5 in his edition of *Plotinus* (Paris: Société d'édition "Les Belles Lettres," 1924-1938), especially VI.1, pp. 165, 171, and 173. My reconstruction agrees in certain details with that sketched by John Fielder in "Plotinus' Reply to the Arguments of *Parmenides* 130a-131d," *Apeiron* 12 (1978), pp. 1-5.
6. Alan Donagan, "Universals and Metaphysical Realism," in ed. Charles Landseman, *The Problem of Universals* (New York: Basic Books, 1971), pp. 98-118, 105.
7. *Ibid.*
8. The translation here is adapted from that of W. D. Ross in ed. Richard McKeon, *The Basic Works of Aristotle* (New York: Random House, 1941), p. 707; cf. also the passage at M. 5 on p. 896.
9. The translation here is adapted from that of E. S. Forster in his Loeb edition of the treatise (Cambridge, Mass.: Harvard University Press, 1955), p. 309.
10. Cf. the discussion of *πορίσις* and *ἀπόξις* in René Aron, *Πρόξις et Θωρία: Étude de détail sur le vocabulaire et la pensée des Ennéades de Plotin*, nouvelle édition (Rome: Presses de L'Université Grégorienne, 1972), pp. 27-37.
11. All translations from III. 8 are adapted from the translation of A. H. Armstrong in his Loeb edition of *Plotinus* (Cambridge, Mass.: Harvard University Press, 1966- ).
12. See Armstrong's note on this passage in his Loeb edition of *Plotinus*, *ibid.*, volume III, p. 368, note 1.
13. *Plato and Parmenides: Parmenides' "Way of Truth" and Plato's "Parmenides,"* translated, with an introduction and running commentary, by Francis MacDonald Cornford (London: Routledge & Kegan Paul, Ltd., 1939), p. 194. For a good introduction to the Neoplatonic reading of the *Parmenides*, see the introduction to Proclus, *Théologie Platonicienne*, texte établi et traduit par H. D. Saffrey et L. G. Westerink (Paris: Société d'édition "Les Belles Lettres," 1968- ). especially volume I, pp. lxxv-lxxxix.
14. It seems to be a distinguishing characteristic of various forms of metaphysical idealism (and, as w-

shall see, Plotinus' system involves some form of metaphysical idealism) to conceive of psyche or mind or consciousness as essentially a locus of relation, a medium for the reconciliation of opposites and the uniting of things that are different; cf. the quasi-Hegelian arguments of T. H. Green and Hastings Rashdall discussed in A. C. Ewing, *Idealism: A Critical Survey*, 3d ed. (London: Methuen & Co. Ltd., 1974), pp. 399-403.

15. The essential negativity of the *psyche* in the context of Proclus' metaphysics and, more generally, within the Neoplatonic tradition is the central subject of Jean Trouillard's *L'Un et l'âme selon Proclus* (Paris: Société d'édition "Les Belles Lettres," 1972).
16. Other recent discussions of productive contemplation include John N. Deck, *Nature, Contemplation, and the One: A Study in the Philosophy of Plotinus* (Toronto: University of Toronto Press, 1967), and Joseph Moreau, *Plotin ou la gloire de la philosophie antique* (Paris: J. Vrin, 1970), chapters X and XI.
17. Cf. III.7[45] 12 19-22, where Plotinus maintains that when *psyche* leaves the activity of discursive contemplation and returns to the unity of *noesis* "time is abolished," which fact shows that it is the life of the *psyche* that generates time (ὅτις ὁ βίος τὸν χρόνον γεννᾷ).
18. The translation here is adapted from that of Armstrong in his Loeb edition of Plotinus.
19. Cf. MacKenna's inspired rendering, "Time in its ceaseless onward sliding produces parted interval," in Plotinus, *The Enneads*, translated by Stephen MacKenna, 4th ed. (New York: Pantheon Books, 1969), p. 540.
20. For an extended treatment of this aspect of VI.4-5, see my "The Doctrine of Reception According to the Capacity of the Recipient in *Ennead* VI.4-5," *Dionysius* III (December, 1979), pp. 79-97.
21. Bréhier, *The Philosophy of Plotinus*, p. 111.
22. *Ibid.*, p. 117.
23. *Ibid.*, pp. 123-129.
24. *Ibid.*, pp. 109-111.
25. For a contemporary discussion of this basic idealistic problem, see Nicholas Rescher, *Conceptual Idealism* (Oxford: Basil Blackwell, 1973), pp. 177-180.

## CANTOR'S SETS AND PROCLUS' WHOLES

1. Alan Calder, "Constructive Mathematics," *Scientific American* 241 (October, 1979), 146-171, and bibliography, p. 186; Felix E. Browder, "The Relevance of Mathematics," *American Math. Monthly* 83 (1976), 249-254; Ernest Snapper, "The Three Crises in Mathematics: Logicism, Intuitionism, and Formalism," *Mathematics Magazine* 52 (1979), 207-216.
2. Evangelos Stamatis, "Peri tēs theōrias tōn Synolōn para Platōni," *Praktika tēs Akademias Athenōn* (1958), 298-303.
3. Proclus, *In Primum Euclidis Elementorum Librum Commentarii*, ed. G. Friedlein (Leipzig, 1873); trans. Glenn R. Morrow, *Proclus' Commentary on the First Book of Euclid's Elements* (Princeton, 1970).
4. Sir Thomas Heath, *History of Greek Mathematics*, 2 vols. (Oxford, 1921), vol. II, pp. 530-536.
5. Proclus, *Elements of Theology*, ed. and trans. E. R. Dodds (Oxford, 1934).
6. Georg Cantor, *Allgemeine Mengenlehre* (Leipzig, 1883).
7. Stamatis, "Peri tēs theōrias," 298-303.
8. Heath, *Greek Mathematics* I, 326-327; and cf. Note 1 *supra*.
9. Calder, "Constructive Mathematics"; Browder, "Relevance of Mathematics"; Snapper, "Three Crises in Mathematics."
10. For the Z-F axioms, see A. A. Fraenkel, Y. Bar-Hillel, and A. Levy, *Foundations of Set Theory* (Amsterdam: North Holland Press, 1973).
11. Snapper, "Three Crises in Mathematics," p. 208.
12. Plato's "Late Learners," *Sophist* 251C-D.
13. The alternative logicist scheme of Whitehead and Russell requires another extralogical axiom, the axiom of reducibility. This, in effect, asserts a context that is not Neoplatonic. Consequently, I will use set theory in the Zermelo-Fraenkel version.

14. Plato *Republic* VII. 528A2-E1: "But this subject [stereometry] does not appear to have been investigated yet" (Shorey's translation).
15. *Republic* VII. 531D1-5.
16. Aristotle *Posterior Analytics* I.27. 87a30-35; II.77a30-35.
17. Cf. Note 8, *supra*.
18. Cf. Note 3, *supra*.
19. R. Courant and H. Robbins, *What Is Mathematics?* (Oxford, 1941).
20. Courant and Robbins, *What Is Mathematics?* p. 108.
21. *Ibid.*, pp. 108-119.
22. Boethius, *de trinitate*. Iff.
23. Courant and Robbins, p. 111.
24. Robert S. Hartman, *The Structure of Value* (Carbondale, Ill., 1967). See also R. S. Brumbaugh, "Formal Value Theory: Transfinite Ordinal Numbers and Relatively Trivial Practical Choices," *Journal of Human Relations* (1973).
25. For Dodds's edition, see Note 3, *supra*. Stamatis works from the edition of Creuzer (Frankfurt, 1822), also citing the *Refutation of Proclus' Elements of Theology* by Bishop Nicholas of Methone, ed. J. Th. Voemel (Frankfurt, 1822).
26. Stamatis translates with the following equivalents: Cantor's *menge* = Proclus' *holon*; Cantor's *regel* = Proclus' *eidos*; Cantor's *element* = Proclus' *meros*; Cantor's *object* = Proclus' *meros*. For philosophical purposes, these equivalences require some further qualifications, though they work well mathematically.
27. Stephan Körner, *Categorical Frameworks*. London (Blackwell, 1970), appendix A.
28. For the difference between systems with continuity and with definiteness, see my "Metaphysical Presuppositions and the Study of Time," *International Soc. for the Study of Time, Proceedings III* (New York, 1978), pp. 7-9.
29. Cf. R. S. Brumbaugh, "Logical and Mathematical Symbolism in the Plato Scholia," *Journal of the Warburg and Courtauld Institute*, (1961), 45-58; 1965, 1-13; 1968, 1-11.
30. See Note 24, *supra*. There is an excellent comparison of Plato's forms and Cantor's sets in a monograph by John Faris, which came to my attention after the present paper was written. (John Faris, *Plato's Theory of Forms and Cantor's Theory of Sets*. Belfast, 1968) Faris' work shows, I think that Proclus has taken up a position of his own, one closer to Plato than Cantor's is.

## THE MATHEMATICS OF MYSTICISM: PLOTINUS AND PROCLUS

1. *Enneads* III.8.8 (351d); III.89 (352b); V.4.1. (516b-c); VI.8.9 (743c). Cf., with respect to the following summary and argument, my "Proclus on the One," *Idealistic Studies* (1973):229-237.
2. Damascius, *Dubitationes*, 43.
3. *Ibid.*, 38. I. 79, 20ff.; 41. I. 83, 26ff.; 42. I. 85, 8ff.; 107. I. 278, 24ff.
4. *Corpus Platonicum Medii Aevii*, ed. R. Klibansky; *Plato Latinus III, Parmenides usque ad finem primae hypothesis nec non Procli Commentarium in Parmenidem, pars ultima inedita*, eds. R. Klibansky and C. Labowsky, trans., G. E. M. Anscombe and L. Labowsky (London: Warburg Institute), 1953.
5. That Proclus thinks Plato intended the first hypothesis to be the correct one is illustrated by the following passages from his *Commentary*: "The alternative remains, that the discussion of the One is either in this [the first] hypothesis, or nowhere. But the latter is unlikely . . ." (p. 65 [26-28]) ". . . so he shows that that most glorious One is neither expressible nor knowable. Now he rightly pronounces the final negation" (p. 71 [29-30]). "For by means of a negation Parmenides has removed all negations. With silence he concludes the contemplation of the One" Anscombe and Labowsky translation (London: Warburg Institute, 1953) (p. 77[4-5]). It is indeed hard to accept Proclus' view as a correct interpretation of Plato since the latter seems to dismiss the first hypothesis as leading to an untenable position. Professor Robert S. Brumbaugh has argued in detail that Plato's proof in the *Parmenides* is an indirect proof by elimination (*Plato on The*

- One*, New Haven, Conn.: Yale University Press 1961); if this is correct, as I think it is, then one must reject, as not being Plato's the mystical Proclusian interpretation of the first hypothesis.
6. Proclus, *Commentary*, London: Warburg Institute p. 45 (lines 13-14). Subsequent page references in the text will all refer to this work cited in Note 4, above.
7. In "Proclus on The One," *Idealist Studies* 3 (1973).
8. Compare my "Self-Reference and the Philosophy of Science" read at the 6th *International Congress for Logic, Methodology, and Philosophy of Science*, Hanover, Germany, August, 1979.
9. For reasons analogous to those presented in Sections I-III, I also feel that Wittgenstein's conclusion to the *Tractatus* is unsatisfactory (6.54): "My propositions serve as elucidations in the following way: anyone who understands me eventually recognizes them as nonsensical, when he has used them—as steps ["means"]—to climb up beyond them. (He must, to speak, throw away the ladder after he has climbed up it.)"
- "He must transcend these propositions, and then he will see the world aright."
- "What we cannot speak about we must pass over in silence." I simply cannot accept this. When the "steps" we have used to get to a certain point (mysticism) are nonsensical or invalid, then our presence at that point is unjustified: the need for our being there has just not been demonstrated.
10. Professor J. N. Findlay has provided some admirable efforts in this direction through his investigation into the logic of such notions. Cf. "The Diremptive Tendencies of Western Philosophy," *Philosophy East and West* 14(1964), 167-178; "The Logic of Mysticism," *Religious Studies* 2(1967), 145-162; "The Logic of Ultimates," *Journal of Philosophy* 64(1967), 571-583; *Ascent to the Absolute* (London: George Allen & Union Ltd., 1970).
11. Cf. Gregory Vlastos, "The Third Man Argument in the Parmenides," *Philosophical Review* 63(1954), 330.
12. Cf. F. B. Fitch, *Symbolic Logic* (New York: The Ronald Press, 1952), the appendix entitled "Self-Reference in Philosophy."

## THE ANATOMY OF A NEOPLATONIST METAPHYSICAL PROOF

1. *Proclus. The Elements of Theology: A Revised Text with Translation, Introduction and Commentary* by E. R. Dodds (Oxford, 1963). Hereafter cited as *E.T.* According to Proclus' own explanation (*In Euclidis EI.*, ed. G. Friedlein [Teubner, 1873], pp. 71, 22-73, 14; cf. *A Commentary on the First Book of Euclid's Elements*, trans. Glenn R. Morrow [Princeton, 1970], pp. 59-60), the meaning of στοιχειώσις in writings with that title presupposes the notion of "element" (στοιχείον) "that determines the arrangement of the elements in Euclid's work." Interestingly, Proclus here defines an "element" as something "ranked as the more primary type (τὰ ἀρχοειδέστερα) of members of an argument [proof] leading to a conclusion, as postulates are elements of theorems" (*In Euc. EI.* 73. 8-9). If Proclus intended to restrict the meaning of "element" with this illustration, the relation of postulate to theorem, where the element is different in "type" or "form" from what it is an element of, then *E.T.*, which consists only of theorems and their proofs, would not conform to his Euclidean model. However, he earlier had defined "element" more simply as "what proves," e.g., as in Euclid "The first theorem is an element of the second" (*In Euc. EI.* 72. 24-26). (I follow Morrow in translating τὸ κατασκευόνον as "what proves," although the sense of the term as used in geometry would more naturally suggest "what solves by construction"; since this is the relation between *Elements* I. 1 and I. 2, the implication is again that Proclus understands elementhood as involving postulates and constructions). The general question here is whether *E.T.* does or does not conform to a Euclidean model as Proclus himself understood the model. On the place of *E.T.* as the first rigorous metaphysical system, cf. R. Beutler, *Reale Encyclopädie*, XXIII. 1, col. 198, "Die einzige systematischen Darstellung der neuplatonische Metaphysik, die uns erhalten ist"; J. Lindsay, "Le système de Proclus," *Revue de Métaphysique et Morale* 28 (1921), pp. 497-523; R. T. Wallis, *Neoplatonism* (London, 1972), p. 146.
2. L. J. Rosán, *The Philosophy of Proclus: the Final Phase of Ancient Thought* (New York, 1949), pp. 36-37, *E.T.* "Is consciously modelled on the *Elements of Geometry* by Euclid"; Wallis, *op.*

- cit.*, *E.T.* follows "the procedures of Euclidean geometry": Stanislas Bréton, "Le Théorème De l'Un Dans Les Éléments De Théologie De Proclus," *Revue des Sciences Philosophiques et Théologiques* 58 (1974), pp. 561–583. The literature on *E.T.* is filled with expressions like "logical deduction" (Wallis, p. 211), "successions logiques" (Lindsay), and so on, which omit any reference to Euclid: this alone might explain Bréton's attempt to think of the proof as free of any geometrical aspects; cf. his *Philosophie et Mathématique chez Proclus* (Paris, 1969).
3. Ian Mueller, "Euclid's *Elements* and the Axiomatic Method," *British Journal for the Philosophy of Science* 20 (1969), pp. 289–309. Cf. David Hilbert, "Axiomatic Thinking," *Philosophy Math* 7 (1970), pp. 1–12.
  4. Mueller, *op. cit.*, pp. 290–291, "Grammatically, at least, these postulates are not existence assertions like their modern counterparts." Euclidean proofs are "thought experiments" involving "An idealized physical object which can be represented in a diagram" (p. 291). Proclus alludes to a view (*In Eucl. E1.* 80. 15–81. 4) that a problem, as distinguished from a theorem in Euclid's sense, asks under what conditions "something exists," which implies that the postulates are among certain existence conditions. But to say that something is an existence condition is not to say that it is an assertion of existence of anything; besides, the view in question was far from universally held.
  5. Jaakko Hintikka and Unto Remes, *The Method of Analysis: Its Geometrical Origin and Its General Significance* (Dordrecht, 1974), seem to support this contention, but continue to treat the postulates at the core of Euclidean  $\epsilon\chi\theta\epsilon\sigma\iota\varsigma$  and auxiliary constructions as assertions of existence ("the existential assumptions that the postulates in effect are" [italics added], p. 4). The position contested by Mueller is represented by A. Szabó, *Anfänge der griechischen Mathematik* (München-Wien, 1969).
  6. *E.T.*, pp. 2, 1. All references to *E.T.* are to Dodds's page and line numbers of the Greek text. No term, such as "proposition" or "theorem" is affixed by Proclus to the numbered statements to be proved in *E.T.* For problems of translation of the first numbered statement to be proved, cf. *infra*, pp. 5–9 and Notes, 14–19.
  7. Cf. Note 1, *supra*. The content of *E.T.* seems wholly derivative (Dodds, p. xxv; followed by Wallis, p. 211). Proclus' originality, therefore lies in his systematic procedure or attempted rigor.
  8. Cf. Jean Trouillard, *L'Un et l'âme selon Proclus* (Paris, 1972), p. 155; Thomas Whittaker, *The Neo-Platonists* (Cambridge, 1918), p. 161; Wallis, *op. cit.*, p. 146.
  9. Dodds, *E.T.*, p. ix: "Lapses even from formal correctness of reasoning may be detected here and there, though less frequently than one might have expected." Dodds's judgment is somewhat surprising in view of the obscurity of many of Proclus' assumptions.
  10. The role corresponding to the postulates in Euclid that permit constructions, but also to the type of infinitely continued operation intuitively presupposed by Proclus' proof of proposition 1. For Proclus' definitions of Euclidean axioms, definitions, and postulates (adapted from Aristotle), cf. *In Eucl. E1.*, pp. 76, 6–77; 2 = Morrow, pp. 62–63. Proclus' definition of a postulate as a statement that is "Unknown and nevertheless is accepted without the student's granting it" places the difficult to grant fifth postulate in the foreground, omitting any reference to the role of the postulates in Euclidean constructions.
  11. In the Euclid commentary, Proclus clearly distinguishes the unproved principles from the theorems and problems that follow them (*In Eucl. E1.*, pp. 75, 5–26). Was *E.T.* written before the Euclid commentary? Dodds, p. xvii, following Freudenthal in all essentials (*Hermes* 16 (1881), pp. 214ff.), pronounces *E.T.* "definitely . . . relatively early." Below I cite evidence independent of chronology which proves that the Dodds-Freudenthal early dating of *E.T.* need have no direct bearing on Proclus' reasons for omitting unproved principles in *E.T.* (*infra*, pp. 23–25). The same evidence proves that Proclus was consciously avoiding certain ingredients of the Euclidean system namely, precisely all unproved propositions.
  12. Cf. Robert Nozick, *Anarchy, State, and Utopia* (Oxford, 1974), pp. 18–22.
  13. Dodds, p. xxv. A test of the usefulness of invisible-hand explanation would be to find an element in Proclus' strategy of proof that goes counter to the intentional design of *E.T.* as a whole, but which can be explained by certain historical facts.
  14. *E.T.*, p. 2, 2–3. The occurrence of  $\sigma\upsilon\nu\tau\iota\theta\epsilon\sigma\theta\alpha\iota$  at 2. 13 is used to supply the verbal idea. I assume throughout that the relation between the "many" and the "multitude" is, loosely, that of composition or componenthood. For the ancient use of  $\pi\lambda\eta\theta\omicron\varsigma$ , cf. Liddell-Scott-Jones (9th ed., 1966), 1417–1418 for examples. Although at times abstract and general, Proclus' notion of multitude is nontechnical. Dodds's version, *E.T.*, p. 3, "Every manifold in some way participates unity," which unavoidably recalls Kant's "*ein Mannigfaltiges*" in the Critique of Pure Reason, seems intended to suggest something technical (but what?). *LSJ* give "quantity" as one meaning of  $\pi\lambda\eta\theta\omicron\varsigma$ , but the uses cited still connote an unstipulated amount, *some* quantity of *something*.
  15. Bréton, *art. cit.*, p. 562. Following M. L. Roure, Bréton translates proposition 1 into symbolic notation as:  $Ux : ax \supset (bx \vee cx)$ . The disjunct is supposed to capture the logic behind "in some way partakes of unity" (as it turns out, for Proclus there are only two ways in which a multitude, which Bréton variously renders as "ensemble," "multiplicité," and "pluralité", can partake of unity). Bréton's vacillation over the meaning of  $\pi\lambda\eta\theta\omicron\varsigma$  can lead to logical confusions, as when he once refers to the "whole" in question as a "*totalité*" (p. 571), which restricts multitudes to those whose components are discrete, countable things. Consider Pappus' remark that "In the case of the continuous quantities. . . the contrary of whole is part, the term 'whole' being applicable to continuous things only, just as the term 'total' is applicable only to discrete [i.e., countable] things," in *The Commentary of Pappus on Book X of Euclid's Elements*, Arabic text and translation by William Thomson (Cambridge, Mass., Harvard University Press, 1930), p. 66. Proclus distinguishes two kinds of wholes in the Euclid commentary, those divisible into like and those divisible into unlike parts (*In Eucl. E1.*, p. 144, 18–145, 25), which is consistent with Pappus' restriction of "whole" to continuous magnitudes since Proclus is here discussing geometrical figures. However, it is doubtful that Proclus would restrict his multitudes in *E.T.* either to magnitudes or to countable totalities. It helps to think of Proclus' multitudes as masses the components of which can be differentiated according to some as yet unspecified procedure.
  16. Bréton, *art. cit.*, pp. 562–564, alludes to the view without attempting a formal treatment; the view was suggested much earlier by Evangelos Stamatis, *Περὶ τῆς θεωρίας τῶν Συνολῶν παρὰ Πλάτωνος Πρακτικὰ τῆς Ακαδημίας Αθηνῶν* (1958), pp. 298–303, as noted and developed by Robert Brumbaugh, "Cantor's Sets and Proclus' Wholes," For expositions of set theory, cf. Abraham A. Fraenkel, "Set Theory," *The Encyclopedia of Philosophy* (1967), vol. 7, 421ff., and *Abstract Set Theory* (Amsterdam, 1966); also W. V. O. Quine, *Set Theory and Its Logic* (Revised ed., Harvard Cambridge, 1978). Because I do not consider all the merits of this view below, I will here simply note that if there is some resemblance between Proclus' need to refer to his sample multitude as a "whole" (*E.T.*, p. 2, 2) and Cantor's 1895 definition of a set as a "collection into a whole" (*Zusammenfassung zu einem Ganzen*, in *Gesammelte Abhandlungen* (Berlin, 1932), p. 282), then one might also compare the claim made by Proclus' first proposition (that all multitudes partake of unity in some way) with Cantor's 1899 "Letter" to Dedekind, in which he speaks of a set as being thought of as "being collected to 'one thing'" (*ibid.*, p. 443). In his first proposition (i.e., theorem) Proclus is trying to prove what Cantor assumed as part of a definition or essential condition of a set. The problem of determining the precise status of Proclus' first theorem goes beyond analogies between "multitudes" and sets to the foundations of set theory.
  17. Damascius Diadochus, *Dubitantes et solutiones de primis principiis*, ed. C. A. Ruelle (Paris, 1889), 126, 11–12. "The term ( $\delta\omicron\upsilon\mu\omicron\varsigma$ ) 'partaking' means . . . 'having' ( $\sigma\epsilon\mu\alpha\iota\upsilon\epsilon\iota\tau\omicron$  τὸ μετέχειν . . . τὸ ἔχειν). Dodds's version, "participates unity" seems awkward and ungrammatical, despite the advantages to which he refers (*viz.*, in translating  $\mu\epsilon\tau\alpha\chi\omicron\mu\epsilon\nu\omicron\varsigma$ ).
  18. Cf. Dodds, *E.T.*, p. 188. The legal or political metaphor locked away in much of Plato's metaphysical vocabulary is overlooked. The root meaning of  $\mu\epsilon\theta\epsilon\chi\epsilon\iota\sigma\theta\alpha\iota$  is joint ownership of possession by many of one thing, as  $\chi\omicron\lambda\upsilon\omega\nu\iota\alpha$  at *Rep.* 476 is an "association" of bodies and actions with forms, or forms with forms. It is only after Plotinus, who makes the realm of forms also a realm of Life and Mind, uneasily distinguished from each other, that  $\mu\epsilon\theta\epsilon\chi\epsilon\iota\sigma\theta\alpha\iota$  clearly takes on a connotation of "participation" in an activity. For one essential phase of this in Plotinus, cf. J. M. Rist, "Plotinus and the Value of the Human Person," unpublished, 1978, p. 5.
  19. G. E. L. Owen, "Notes on Ryle's Plato," *Ryle: A Collection of Critical Essays* (New York: Anchor, 1970), p. 342, is content to use either "the One" or "Unity" for "τὸ ἓν" in *Parm.* Plato had other ways of referring to unity, (e.g., *Parm.* 129B7 ὁ ἑστὶν ἓν, 158A5 αὐτὸ ἓν, 158C6 τὸ

- εἶδος (sc. τοῦ ἑνός)), since Owen follows Ryle in treating the former expression as referring to "one of Socrates' Forms," all of these expressions would be namelike. Cf. Aristotle *Phys.* IV. 13. 222a19; *Met.* 1023b36. "τὸ ἐν" seems to function as a name in proposition 13, if the "is" at 16, 8 is of identity and not predication. For a treatment of inconsistencies that follow from Proclus' treatment of names of his highest principle, cf. Carl Kordig, "Proclus on the One," *Idealistic Studies* 3 (1973), pp. 229–237.
20. Proclus, *In Eucl. El.* p. 74, 13–16. Axioms are most credible (p. 76, 9–12), followed by definitions or "hypotheses" (p. 76, 12–17) and postulates (p. 76, 17–21). For an interesting discussion of ancient disputes about the Euclidean definitions, cf. Thomas L. Heath, *Euclid's Elements* (New York: Dover 1956), vol. I, pp. 155–194.
  21. Cf. *In Eucl. El.* pp. 254, 21–256, 8.
  22. An example of a Pythagorean *reductio* proof is found appended to Book X of the *Elements*. *Euclid's Elementa X cum Appendice post Heiberg*, ed. E. S. Stamatis (Leipzig: Teubner, 1972), vol. III, App. 27, pp. 231, 10–233, 13. Cf. Heath, *A History of Greek Mathematics* (Oxford, 1921), vol. I, p. 168. Euclid uses *reductio* in Book II. 8 and III. 1. For Zeno of Elea and Plato, it is the standard rigorous form of argument, and is used by Aristotle as well. For Szabó's suggestive remarks, cf. Hintikka and Kemes, *op. cit.*, "Working Backwards and Proving by Synthesis", p. 128. Proclus sees no connection between the method of analysis and reduction to impossibility proofs. In the passage where he says that Plato "taught this method [analysis] to Leodamas" (*In Eucl. El.*, p. 211, 21–22), he clearly distinguishes it from the latter (p. 212, 1–4).
  23. Literally "For if it were in no way to partake" (ἐἰ γὰρ μὴδαμὴ μετέχου).
  24. The notion of many *making up* a multitude has to be supplied from the context, and the occurrence of συντίθεσθαι at 2, 13. Dodds's "nor any of its several parts" is an overtranslation. No term for "part" (μέρος, μέροςον) occurs in the proof.
  25. Cf. *infra*, (10) and also my Note 35 of this essay. How does Proclus justify "*m* is not one  $\supset$  *m* is infinite multitude"? He assumes that unity of components is a necessary condition of the unity of the multitude made up of those components (cf. *infra*, p. 15 and Note 31); so he infers that "*m* is not one" means that *m* is radically divisible, that is, divisible for every component  $c_n$  of level *n*.  $n \rightarrow \infty$ . Cf. *infra*, pp. 12–13, 15–16.
  26. (9) could be inferred from Zeno, DK B2 (cf. Vlastos' version, "Zeno of Elea," *art. cit.*, p. 369–370) or, more directly, from the Zenonian argument reported by Aristotle, *GC* 316a14–34, 325a8–12, and Simplicius, *In Phys.*, p. 139, 24–140, 26 (= Lee 2; cf. Vlastos, *ibid.*, pp. 371–372); if what is is "divisible through and through" (παντὶ ὁμοίως . . . διαίρετον), then one possibility is that "It will be dissolved into nothing and consist (συστήσεται) of nothing" (Lee, p. 12, 13), and "If indeed it consists, again it consists of nothing" (Lee, p. 12, 17–18).
  27. Not, as Dodds translates, "an infinity of infinities." For the use of ἀπειράκις, cf. Aristotle, *De an.* 407a14 = "infinitely many times" and *LSJ*.
  28. *Phys.* 207a1–2, The infinite "Is not what has nothing outside it, but what always has something outside it (οὐ αἰετὶ τι ἔξω ἔσται)". trans. Robertson-Hardie. Aristotle improves on this rough formulation at 207a7–8: "That is infinite such that for any amount they take there is always something outside to take." This, of course, is still rough and is true only of infinite things, such as magnitudes, substances, series, place, and time. Aristotle's technical term for his own view of the infinite as ἀδιέξοδον (207a14), "what cannot be gone through."
  29. *El.* I. C. N. 5.
  30. *In Eucl. El.*, p. 77, 7–81, 22, esp. 81, 5–18.
  31. Note that this again rules out the concept of an empty multitude, which could have unity but no components. Presumably, this assumption also would mean that for Proclus the unity of a multitude, however strong (e.g., the collection of all Platonic Forms), is not logically independent of the unity of its components. For the gap in Proclus' proof, cf. my remarks on (8), p. 128, *supra*.
  32. (9).
  33. Cf. *supra*, Note 26, and William E. Abraham, "The Nature of Zeno's Argument Against Plurality in DK 29 B1", *Phronesis* XVII (1972), pp. 40–53.
  34. Theo Gerard Sinnige, *Matter and Infinity in the Presocratic Schools* (Assen, 1968), pp. 70–83; B. L. Van der Waerden, *Science Awakening* (Oxford, 1961), pp. 98–99. It is an important insight of Sinnige that γνῶμα can refer to any repeatable (constructible) pattern, not merely a "carpenter's square" (cf. Kirk and Raven, *The Presocratic Philosophers* [Cambridge: Harvard Univ. Press, 1963] pp. 243–244) and not "Any number which when added to a figurate number gives the next number" (Ross, *Aristotle Physics*, pp. 542–545). What is important is that the patterns are repeated according to postulates, that is, rules of construction. It was Zeno's special genius to apply these gnomonic constructions where they have paradoxical implications.
  35. The sense of ἀπειράκις ἀπείρων is this: (1) If no component of a given multitude *m*,  $C_N \rightarrow \infty$ , has unity, then any component  $c_n$  is an infinite multitude; (2) and since we can apply the same reasoning as often as we like, we get infinite times many infinite multitudes, or for short, "infinitely many infinities" [in succession].
  36. Cf. *Phys.* 207b11–15.
  37. Cf. Heath, *Elements*, vol. III, pp. 15–16.
  38. A. A. Fraenkel, *Abstract Set Theory* (Amsterdam, 1966), sec. 5, th. 2; Quine, *op. cit.*, p. 201, 28. 17 = Cantor's theorem.
  39. Fraenkel, *op. cit.*, p. 29. I assume that we may here think of subsets as "making up" a set, though obviously not precisely in the same way that a set's members "make up" the set (any set has more subsets than members).
  40. Mueller, *art. cit.*, pp. 290–291 with Notes 3–4.
  41. *In Eucl. El.*, pp. 78, 20–79, 2. His comments are worth citing in part: "The discovery of theorems does not occur without recourse to . . . intelligible matter. In going forth into this matter and shaping it, our ideas are plausibly said to resemble acts of production (γενέσεσιν); for the movement of our thought (τῆς διανοίας ἐμὴν κίνησιν) in projecting its own ideas is a production, we have said, of the figures in our imagination (φαντασία) and of their properties. But it is in imagination that the constructions (συστάσεις), sectionings, superpositions, comparisons, additions, and subtractions take place, whereas the contents of our understanding (τὰ δὲ ἐν τῇ διανοίᾳ) all stand fixed, without any generation or change" (trans. Morrow, p. 64). Proclus distinguishes the contents in thought, the movement of thought, and the place, imagination, in which thought carries out these movements. He does not restrict the constructivist role of thought to Euclidean problems because he treats construction (κατασκευὴ) as one of the essential "parts" of theorems also (*In Eucl. El.*, p. 203, 1–4).
  42. Cf. *supra*, Notes and 25, 35.
  43. Bréton, *art. cit.*, p. 564. An axiom in need of proof is not an axiom. Bréton says that proposition I "prend les allures d'un théorème," which approaches saying that it is not a real theorem or is not proved, with which I would agree. The more interesting claim is that proposition I is for some reason *unprovable*.
  44. *In Eucl. El.*, p. 76, 9–12.
  45. *Parm.* 158B2, B8–9.
  46. *Parm.* 158C2–7.
  47. *E.T.*, Commentary, p. 188.
  48. *In Parm.*, ed. Cousin, cols. 1292–94.
  49. Proclus' testimony that Zeno's work contained forty arguments (*In Parm.*, col. 694, 23–25), repeated or confirmed by Elias (*In Cat.*, 109,6; cf. DK 29 A15) may be evidence that Proclus had Zeno's work, although for lack of stronger confirmation this is not generally credited.
  50. The possibility is, of course, entirely conjectural. The immediate ancestors of Proclus' Proposition and proof could as well have been earlier Neoplatonist commentaries on the *Parmenides* like the one by Plutarch of Athens (*In Parm.*, cols. 1058, 21–1061, 20). What is striking, however, is that Plato's strategy and intentions in *Parm.* 158 and Proclus' strategy in *E.T.* are clearly not the same if we consider the whole context in each case.
  51. *In Eucl. El.*, p. 72, 3–4.
  52. *In Eucl. El.*, p. 76, 1.
  53. *In Eucl. El.*, p. 76, 4–6.

54. *In Eucl. El.*, p. 75. 5-14.
55. Dodds, *E.T.*, p. x, seems to have anticipated my view here when he writes that *E.T.* may be regarded "As an attempt to supply the comprehensive scheme of reality desiderated by Plato in the seventh book of the *Republic*," but he links *E.T.* with *Rep.* VII instead of *Rep.* VI, as I do.
56. Cf. my argument for this in "The Neoplatonist Interpretation of Plato: Remarks on its Decisive Characteristic," *The Journal of the History of Philosophy* VII (1969), pp. 19-26.
57. Cf. F. M. Cornford, "Mathematics and Dialectic in the *Republic* VI-VII," *Mind* N.S. 41 (1932), pp. 37-52, 173-190; R. Hackforth, "Plato's Divided Line and Dialectic," *The Classical Quarterly* Jan.-Apr. (1942), pp. 1-9. Proclus seems to distinguish metaphysical from mathematical reasoning by means of the role played by imagination in the latter. Cf. A. Charles, "L'imagination, miroir de l'ame selon Proclus," *Actes du Colloque de Royaumont* 69 (1971), pp. 441-451. But then how would Proclus characterize the movement of the mind implied in his own proof of proposition 1? Issues in the foundations of mathematics seem inevitably to press in on us. Proclus seems to be closer to Brouwer than to Russell and Frege, as Julia Annas argues in the case for Plato's theory of foundational principles, *Aristotle's Metaphysics Books M and N*, translated with introduction and notes by Julia Annas (Oxford, 1976), p. 43.
58. Cf. Note. 13.

## THE IDEA OF FALSE IN PROCLUS

Note: Passages from the *Commentary in Euclid's Elements' First Book*, hereafter *In Eucl.*, numbered according to the edition by Friedlein, are given here in the English translation of Glenn Morrow, *Proclus, A Commentary on the First Book of Euclid's Elements* (Princeton, N.J.: Princeton University Press, 1970). All the remaining translations, except *Enn.* III. 6. 7, are mine.

1. Cf. E. Moutsopoulos, *Cognition and Error* (in Greek) (Athens: 1961), pp. 37 sq.; "Vers un élargissement du concept de vérité: le presque-vrai," *Annales de la Fac. des Lettres et Sc. Hum. d'Aix*, 40, 1966, pp. 189-196; *Knowledge and Science* (in Greek) (Athens: Univ. Press, 1972), pp. 134.; Du "faux" dans l'art. *Actas del II Congreso Nacional de Filosofía (Cordoba, Arg. 1971)* (Buenos Aires: Ed. Sud-americana, 1973), pp. 335-338; and *Annales d'Esthétique*, 9-10, 1971, pp. 39-43.
2. *PARM.*, Fr. B 3 (5) (D-K., I, 231): "for, thinking is identical to being."
3. *ID.*, fr. B 7 (D-K): "It will never be conceded that nonbeings be."
4. Cf. *Soph.* 241a; cf. E. Moutsopoulos, *The Ontological Status of Art in Plato's "Sophist"* (in Greek) (*Athens*: 62, 1958), pp. 369-378. Cf. Proclus, *In Alcib.* 108. 3, (trans. Westerink): "it is false to assert . . . that there really is a nonbeing, as Plato's inspired interpreters use to say."
5. Cf. P. M. Schuhl, *L'oeuvre de Platon* (Paris: Hachette, 1954), pp. 117 sq.
6. Cf. L. Stefanini, "La Scepsi platonica," *Giorn. Crit. Filos. Ital.*, 1931, pp. 241-247; E. Moutsopoulos, "From Dogmatism to Skepticism. The Importance of the Academy and the Role of the Stoa," *Stasinos*, 1974, pp. 157-166.
7. Cf. *Enn.* III. 6. 7: "Matter has no reality . . . it is mere indetermination . . . and so has no title to the name of Being. It will be more plausibly called a nonbeing, and this not in the sense that movement and station are Not-Being (i.e., as merely different from Being) but in the sense of veritable Not-Being, so that it is no more than the image and phantasm of mass, a bare aspiration towards substantial existence; it is stationary but not in the sense of having position, it is in itself invisible . . . a phantasm unabiding and yet unable to withdraw . . . so absolute its lack of all Being." Cf. Plato, *Tim.* 52b (trans. MacKenna): "it is palpable without sensation, through some spurious thought . . . it is nothing at all."
8. Cf. *Rep.* VII. 514a sq.

18. Cf., for instance, *In Parmen.* 995. 36 (trans. V. Cousin): "error . . . moves around according to such an itinerary . . . as well as in the intellect, such a variety of thoughts"; *ibid.*, 996. 6 (Cousin): "it is said that whatever moves towards multiplicity moves in an erroneous way."
19. Cf. *ibid.*, 988. 38.
20. Cf. *ibid.*, 914. 34 (Cousin): "it is false to merely extend inversion to everything." Cf. *ibid.*, 728. 35; 856. 26; 857. 6; 1040. 31; 1039. 31.
21. Cf. *ibid.*, 978. 17 (Cousin): "one should not wonder if something which proves to be true (in one case) would prove false when applied to another."
22. Cf. *ibid.*, One should insist upon the importance of the repeated terms "upon . . . upon."
23. Cf. *ibid.*, "proposed."
24. Cf. *ibid.*, 975. 15 (Cousin): "it has been proved that not only everything is true, but also that whatever is false in it may be completely cured." Cf. *infra*, and Note 43.
25. Cf. *supra*, and Note 3, on nonreducibility of being and non being; cf. *supra*, and Note 2, on identifiability of being and thinking, in *Parmenides*. On Plato's theory of the mixed, cf. N. I. Boussoulas, *L'être et la composition des mixtes dans le "Philebe" de Platon* (Paris, P.U.F., 1952); cf. E. Moutsopoulos, *La musique dans l'oeuvre de Platon*, pp. 360 sq.
26. Cf. *In Parm.* 654. 17 (Cousin): "it either only reveals the truth or only controls the false." Cf. *infra*, and Notes 32 and 39. In geometry, theorems are true or false; problems are possible or impossible. Cf. *In Eucl.* 330. 15 (trans. Friedl).
27. Cf. *ibid.*, 654. 19-22 (Cousin): "by searching whether each one's opinion is true or not, whether sensation is knowledge or not . . . to what extent are true opinions partially invalid, and by testing again and proving that they are unsound."
28. Cf. *ibid.*, 951. 39: "in its development, the argument proves that ignoring such things and failing to dominate them is pure falsehood."
29. Cf. *ibid.*, 893. 22 (trans. Cousin): "what is given through sensation is something imaginary and unconceivable; it should remain such (within the soul) as ■ has been received from the very beginning, so that false and nonbeing may not occur (through it) . . . (error) proceeds only from the soul."

30. Cf. *In Alcib.* 243. 13 (trans. Westerink): "the crowd is the cause of false opinion; for (it inspires to us) evil images since our young age."
31. Cf. *ibid.*, (trans. Westerink): "it even causes various passions."
32. Cf. *In Tim.* III. 341. 8 sq. (trans. Diehl): "and these . . . passions affect the irrational soul; it however occurs that they also affect the rational soul."
33. Cf. *In Alcib.* 175. 14 (trans. Westerink): "even the soul, by being perturbed by false opinion and by accepting help from knowledge according to its own habit, generates an even false opinion and fallacy."
34. Cf. *In Plat. Theol.* (Aem. Porus) 55. 27.
35. Cf. *Hypotyposis* (trans. Manutius) 18. 5; cf. *In Eucl.* 40. 13 (trans. Friedlein): "optics . . . which explains the illusory appearances presented by objects seen at a distance." cf. *ibid.*, 248. 8 (trans. Friedlein).
36. Cf. *ibid.*, 352. 22 (trans. Friedlein): "by proving that they (sc. "certain Hypotheses") are erroneous or superfluous," *ibid.*, 248. 8 (Friedlein): "and so prepares the way for the refutation of unfounded objections"; *ibid.*, 70. 13 (Friedlein) "setting the true beside the false and adapting its refutations of error to seductions we may encounter" (see Note 42); *ibid.*, 247. 21 (Friedlein): "for refuting error."
37. Cf. *In Eucl.* 247. 21 (trans. Friedlein): "it is a mark of scientific and technical skill to arrange in advance for the undoing of those who attack what is going to be said and to prepare the positions from which one can reply so that the previously demonstrated matters may later serve not only for establishing the truth, but also for refuting error."
38. Cf. *ibid.*, 70. 13: τοῦ ἔλεγχον τῆς ἀπάτης συναπομόσας. The parallel use of φεῦδος and ἀπάτη underlines the moral dimension of the notion. Cf. *In Alcib.* 166. 9 (trans. Westerink): "he drives falsehood away from his life and, at the same time, does not clearly confess that he is fond of commanding and of authority"; *ibid.*, 190. 3 (Westerink): "due to the falsehood that surrounds him, he has not received the principles of research."
39. Cf. *In Eucl.* 69. 28 (Friedlein): "If you add or take away any detail whatever you are not inadvertently leaving the way of science and being led down the opposite path of error and ignorance?"
40. Cf. *ibid.*, "against"; *ibid.*, 253. 17 (Friedlein): "we must also note in this connection that many conversions are made fallaciously and are not true."
41. Cf. *supra.* and Notes 19 and 20.
42. Cf. *In Eucl.* 59. 3–6 (Friedlein): "Hence geometry also furnishes criteria whereby we can discriminate between statements that follow from its principles and those that depart from them. The various tropes for refuting fallacies when they occur have this function"; *ibid.*, 70. 10–13 (Friedlein): "[Euclid's book entitled *Fallacies*] enumerates in order the various methods of refutation and for each of them provides exercise for our understandings by a variety of theorems, setting the true beside the false and adapting its refutation of error to the seductions we may encounter"; *ibid.*, 212. 19–23 (Friedlein): "An 'objection' prevents an argument from proceeding on its way by opposing either the construction or the demonstration. Unlike the proposer of the case, who has to show that the proposition is true of it, he who makes an objection does not need to prove anything; rather it is necessary [for his opponent] to refute the objection and show that he who uses it is in error."
43. Cf. *supra.* and Note 24.
44. Cf. *In Tim.* III. 341. 8 (trans. Diehl): "even those who have false opinions also display some true opinion; it is through the latter that they are proved to have false opinions." Cf. *ibid.*, III. 340. 9 (Diehl) "to have a false opinion."
45. Cf. *supra.* and note 26.
46. *In Tim.* III. 340. 8–11 (trans. Diehl): "due to sensations, the opinative faculty is distorted, opines falsely and becomes multiple; . . . it is thus filled with false opinions: it thus splits out, just as sensation, and rebels against itself."
47. Cf. *ibid.*
48. Cf. *Soph.* 241a. Cf. E. Moutsopoulos, "The Ontological status." Cf. *supra.* and Note 4.

## PARTICIPATION AND THE STRUCTURE OF BEING IN PROCLUS' ELEMENTS OF THEOLOGY

1. See Props. 116. 102. 13 sq.; 123. 108. 27–28. See Note 9, below. Born in Byzantium in either A.D. 410 or 412. Proclus studied at Alexandria in Egypt rhetoric and Roman law, afterwards mathematics and philosophy (the last under Olympiodorus the Peripatetic). Moving to Athens ca. 430, he continued his study of philosophy in the Platonic Academy under Plutarch of Athens and, especially, Syrianus. Shortly after the latter's death, Proclus assumed the leadership of the Academy until his death on April 17. 485. See T. Whittaker, *The Neo-Platonists* (Cambridge, England: University Press, 1928), pp. 157–159; L. J. Rosan, *Philosophy of Proclus* (New York: Cosmos, 1949), pp. 12–13 and pp. 13–35 (the last is a translation of Marinus' biography of Proclus); P. Bastid, *Proclus et le crépuscule de la pensée grecque* (Paris: J. Vrin, 1969), pp. 5–18; G. Martano, *Proclo di Atene: L'ultima voce speculativa del genio ellenico* (rev. ed. of *L'uomo e Dio in Proclo* [1952]; Napoli: Giannini, 1974), pp. 7–28.
2. For our purposes, "beings" in Proclus' *Elements* are all existents below the level of the One and henads and, thus, would comprise the levels of Being, Life, Nous, Soul, and Nature. For various listings, see Notes 11 and 12, below.
3. For the Greek text we shall use E. R. Dodds, *Proclus, The Elements of Theology* (Oxford: Clarendon Press, 1933; 2nd ed., 1963). In our references to this edition, the first number refers to the proposition, the second to the page, the third to the lines. As often as is conveniently possible, we shall put direct references to Proclus in the body of the paper itself so as to cut down the number of Notes. Whenever quoted, the Greek text will be put in the Notes.  
In our English translation we have been helped by Dodds, *ibid.*, and by Moerbeke—see ed. C. Vansteenkiste, O.P., "Procli Elementatio Theologica Translata a Guilielmo de Moerbeke," *Tijdschrift voor Philosophie* 13 (1951), 263–302 and 491–546; also Jean Trouillard, *Proclus' Éléments de théologie* (Paris: Aubier, 1965).
4. The monad that is the source of the perfection can also be said to be present in the participant but solely through the perfection.  
See Propositions 18 and 25 as instances of the wide variety of verbs Proclus uses for "to produce" or "to cause." They seem to have only minor shades of difference in meaning. On "procession" and other aspects of causality in Proclus, see P. Bastid, *Proclus*, p. 216 sqq.; J. Trouillard, "L'antithèse fondamentale de la procession selon Proclus," *Archives de Philosophie* 34 (1971), 435–449; *idem*, *L'un et l'autre selon Proclus* (Paris: Les Belles Lettres, 1972), pp. 78 sqq. and 91 sqq.; *idem*, "La moné selon Proclus," *Le néoplatonisme* (Paris: Centre National de la Recherche Scientifique, 1971), pp. 229–240; W. Beierwaltes, *Proklos: Grundzüge seiner Metaphysik* (Frankfurt am Main: Klostermann, 1965), pp. 118 sqq.
5. Likeness holds an important place generally in Proclus' causal doctrine. It is responsible for an effect's procession from its cause (see 29. 34. 3 sq. and, especially, the strong statement in line 6: "It is likeness which generates the product out of the producer"), as well as its reversion back to it (32. 36. 3 sq.).
6. This point is already implied in the fact that the participation is present in the participant.
7. The fact that the participation must somehow be part of the participant does not conflict with Props. 64. 81. or similar passages. The perfection participated can either itself reside in the participant or remain separate and yet produce an irradiation or offshoot which inheres in it. This point will be developed later in "The Origins of Participated Perfections."
8. Also matter must be excepted since of itself it is participant and nothing else. It is below participation, The One is above participation. In my more recent interpretation, schematized in Diagram Two, the henads, too, are not composites of participant/participation but are participations or participated perfections only.
9. What does Proclus intend by saying elsewhere (116. 102. 13 sq.; 123. 108. 27–28) that The One is unparticipated? Basically, this: that although it is the source of participations for subsequents, still

it is not itself a participation nor is it a participant of anything (99. 88. 32-33); that (as is true of every monad in relationship to the series it initiates) "it is common to all that can participate and is identical for all and, hence, is prior to all" (23. 28. 5-7); that "it has primacy in its own series and does not proceed from other principles" (99. 88. 24-25).

Besides those passages listed in the body of the article, the One is said to be participated in the following: 25. 28. 31-32; 109. 96. 23; 114. 100. 24.

10. Always, of course, excepting The One and matter, as well as henads in my more recent exegesis (see Note 8). On henads see Prop. 137 (discussed below as the final key text in the section, "The Origin of Participants"); G. Martano, *Proclo*, pp. 131 sq.; P. Bastid, *Proclus*, pp. 254-271.

11. Also see 14. 16. 9 sq., where the lowest three strata are listed. The henads are not mentioned in either Props. 20 or 14, but they are in 21. 24. 29 sq. and 6. 6. 26-28 (my interpretation here differs from Dodds, *op. cit.*, p. 196). Abundant attention is given to the One-Good in early passages—see Props. 4, 5, 8, 11, 12, and 13.

12. This ordering of the monads occurs rather frequently in the *Elements*. Besides Prop. 20, see Props. 57, 62, 63, 64, 109, 129, and 139. In the foregoing Propositions, the second monad (Intelligence) is equivalent to Being-Intelligence; in Props. 160-165 Being is separated from Intelligence, with this resultant list: The One, Being, Intelligence, Soul, bodies.

There are, though, at least two other arrangements of monads, the first of which is: The One, First Limit, First Infinity, Being, Eternity, Time (Props. 90-94). The other arrangement is: The One (as well as gods or henads), Being, Life, Intelligence (Props. 39, 101, 105, 138). On the triad Being, Life, and Intelligence, see E. R. Dodds, *op. cit.*, pp. 252-254; L. J. Rosan, *Philosophy of Proclus*, pp. 97-98; Pierre Hadot, "Être, vie, pensée chez Plotin et avant Plotin," *Les Sources de Plotin*, tome V of *Entretiens sur l'antiquité classique* (Vandoeuvres-Genève: Fondation Hardt, 1960), pp. 105-158; *idem*, *Porphyre et Victorinus* (Paris: Études Augustiniennes, 1968), pp. 213-236 and 260-271; P. Bastid, *Proclus*, pp. 354-364; R. T. Wallis, *Neoplatonism* (New York: Scribner's Sons, 1972) pp. 66-67, 124-125, 130-133; S. Gersh, *Kinēsis Akinetos: Spiritual Motion in the Philosophy of Proclus* (Leiden: Brill, 1973), pp. 20-22 and 78-80; *idem*, *From Iamblichus to Eriugena* (Leiden: Brill, 1978), pp. 47, 87-88, 143 sq.; G. Martano, *Proclo*, pp. 161-165; W. Beierwaltes, *Proklos*, pp. 93 sqq.

13. Lines 22-24: Πάν τὸ ἀμέθεκτον ὑφίστησιν ἀπ' ἑαυτοῦ τὰ μετεχόμενα, καὶ πᾶσαι αἱ μετεχόμεναι ὑποστάσεις εἰς ἀμεθέκτους ὑπάρξεις ἀνστέίνονται. Note that for ὑφίστησιν (line 22) Proclus substitutes ἀπογεννᾷ (line 26) and δώσει (line 28).

Following Moerbeke's lead (see C. Vansteenkiste, *op. cit.*, p. 275), I transliterate rather than translate ὑποστάσεις. On the meaning of the term in various authors, see Heinrich Dörrie, "Hypostasis: Wort und Bedeutungsgeschichte," *Nachrichten der Akademie der Wissenschaften in Göttingen*, (1955), 35-72. The noun, ὑπαρξίς, means, I think "that which is the proper, unique reality" of an existent (see Dodds, *op. cit.*, p. 235, n. 1). For example, the *hyparxis* of The One is absolute unity and supreme goodness, of the Being is limit/infinity (Prop. 102), or intelligible form (Prop. 161). The word is not synonymous with "being," "existence," "substance," or "subsistence" (on this last see J. Trouillard, *Éléments*, p. 77).

14. This fact is equivalent to the monad being at once everywhere and nowhere (see 98. 86. 27).
15. Perhaps this second fact is the explanation of how unparticipated monads are also said to be participated. See above on The One (Note 9). In 53. 52. 6-7, Eternity and Time are instanced as (presumably) monads causing participations—namely, eternities and times. On Eternity and Time, see Peter B. Manchester, "Intellectual and Sensible Time in Neoplatonism: An Introduction," (with references to studies by Sambursky and Pines, Armstrong, Whittaker, Callahan, Ford, Beierwaltes).
16. Lines 1-3: Πάν τὸ ἀμέθεκτον διττὰς ὑφίστησι τῶν μετεχομένων τὰς τάξεις, τὴν μὲν ἐν τοῖς ποτὲ μετέχουσι, τὴν δὲ ἐν τοῖς αἰεὶ καὶ συμφυῶς μετέχουσι.
17. Lines 11-12: ἄλλων ἐστὶν οἰστικὰ τῶν ποτὲ μετεχομένων.
18. Mediation is an important and almost universal factor in causality. The One causes only matter (57. 54. 23 sq. and 57. 56. 14-16) and the henads immediately. All else it causes through the henads and whatever else has already been caused. Mediation is required by the basic principle

that "every cause sets up things which are like it before things which are unlike" (28. 32. 10-11). Mediation, as does likeness (see Note 5), governs both procession and reversion (38. 40. 22-25).

See Note 21 for discussion of a different sort of mediation.

19. See *op. cit.*, p. 234.
20. On this point a demon is in contrast with, for example, a heavenly body, which is an everlasting participant of a henad (through its soul and intelligence—129. 114. 12 sq.) and whose unity is a participation of the first sort (see Dodds, *ibid.*, p. 234). On demons and their place in the Proclian universe, see *ibid.*, pp. 294-295.
21. Prop. 81 is a description of mediation unlike that encountered previously (see Note 18, above). There it had to do with how the cause produces the effect. Here it has to do with how the effect participates the cause. Even this latter description can be made in two ways. Prop. 81 (and parallel texts) is in terms of the perfection participated: there are cases in which a participant participates a cause through a mere irradiation or power of a perfection. But other Propositions are in terms rather of the relationship between participants and the source of those perfections: a higher participant participates its cause directly, a lower participant indirectly. For example, 128. 114. 1 sq.: "Every god, when participated by what is nearer to him, is participated directly; when participated by what is more remote, through fewer or more intermediaries." Thus, a god or henad is participated directly by a being but by an intelligence through a being, by a soul through an intelligence and a being, etc. (see Prop. 129).

As a variation of this last sort of description, see 108. 86. 9 sq. and 109. 96. 23 sq.: A member of a lower series (say, a soul) participates the monad even of a higher series (The Intelligence) through the member of the higher series it directly participates (an intelligence), as well as through the monad of its own series (the Soul).

Incidentally, "irradiation" in Prop. 81 is identical in meaning with the same word in 64. 60. 21 and 64. 62. 6. It is not identical with the same word in 63. 60. 13; 64. 62. 11; 70. 66. 12; 137. 120. 35, in all of which it has the general meaning of "participation" (whether of the first or second sorts).

22. Apparently, Proclus' doctrine on self-constitution (Prop. 40 sq.) is parallel to and based on self-sufficiency (see 40. 42. 10-17). If so, what is and what is not self-constituted (τὸ αὐτοῦτόστατον) would roughly correspond also to the first and second sorts of participations since what is and what is not self-sufficient are parallel to these. Also, the differences he establishes between what is and what is not self-constituted match pretty well those between the two kinds of participations, as this list of differences in the former show: Prop. 41: what needs no alien seat because contained by itself and conserved in itself without a substrate *versus* what is in another and requires a substrate; Prop. 42: what can revert upon itself *versus* what cannot; Prop. 45: the *agenēton* *versus* the *genēton*; Prop. 46: the imperishable *versus* the perishable; Prop. 47: the indivisible and simple *versus* the divisible and composite; Prop. 49: the perpetual *versus* the transient; Prop. 51: the atemporal *versus* the entitatively temporal. See J. Whittaker, "The Historical Background of Proclus' Doctrine of the *Aythypostata*," in ed. H. Dörrie, *De Iamblique à Proclus*, tome xxi of *Entretiens sur l'Antiquité Classique* (Vandoeuvres-Genève: Fondation Hardt, 1975), pp. 193-237.
23. One should remember (see above, Note 21, last paragraph.) that Proclus uses "irradiation" (*ellampsis*) in at least two ways. In 64. 60. 21 and 64. 62. 6, it points to a participation received intermittently by the participant (also see 81. 76. 19). But in 63. 60. 13; 64. 62. 11; 70. 66. 12; and 137. 120. 35, it has the general meaning of a "participation" (or "perfection participated"), whether permanent or intermittent.
24. Roman T. Ciapalo drew the diagram, as well as diagrams 2 and 3 below, for which I am grateful.
25. These initial members are of two sorts inasmuch as they either are themselves participants of a higher series (e.g., Being and beings 1 and 2, Intellect and intellects 1 and 2, Soul and souls 1 and 2) or are not such participants (henads 1 to 12, which are, incidentally, the traditional Greek gods). What both sorts have in common is that the members are themselves not participated. No significance is to be attached to there being more henads than beings, and so on: this arises simply to keep the diagram on a single page. Actually, there should be more beings than

- henads, more intellects than beings, more souls than intellects—see props. 62. 58. 22; 110. 98. 1; 111. 98. 18; Dodds, *op. cit.*, p. 256.
26. Lines 24 and 26–27: ἡ μὲν ὕλη, ἐκ τοῦ ἐνὸς ὑποστάσα. . . ἡ μὲν γὰρ ὕλη, ὑποκείμενον οὐσα πάντων, ἐκ τοῦ πάντων αἰτίου προήλθε.
27. The context shows that “irradiation” here is not restricted, as in Prop. 81, to the second sort of participation but indicates any sort, whether first or second. See Note 21, last paragraph.
28. The awkwardness in prop. 72, as in its two predecessors, arises from speaking of the characters, properties, attributes of causes and effects rather than directly of the causes and effects themselves. This manner of speech, though, is frequent and important in Proclus (e.g., see Props. 18, 19, 97).
29. What is the result of this participation? Body receives form (57. 56. 12–13) or, in other texts (89. 82. 1 sq.; 102. 92. 1 sq.), determination and limit (presumably through form, since the henads determine matter through unity—see 117. 112. 29 sq.).
- One should note that, in 74. 70. 22 sq., being is affirmed to be prior to forms, that every form is a being but not every being is a form: “Hence in the resultants privations are in some sense beings although they are not forms; for through the unitary power of Being they too have received some feeble reflection of being.” It is not clear what that “feeble reflection of being” would be that is not form. Might it be unity? In 135. 120. 1 sq. being is closely aligned with the henad it participates. Perhaps their causality also is closely aligned so that what first results from them is the unification of the recipient. Or might it be the state of potential being which privation or matter has prior to reception of form and its state of actual being? See 138. 122. 15 sq.
30. The genesis of matter from The One is what one would expect from Prop. 71. If, in general, the irradiations from higher causes become the participant for irradiations from lower causes, then what the absolutely highest cause produces would be the participant for absolutely all other causes.
- Once the origin of matter is accounted for, that of other participants poses no problem since they are matter plus participation(s) with respect to still further participations. Obviously, “participant” is a relative notion (save with respect to matter): any recipient, however complex or perfect, is a participant in relation to further perfections received.
- Incidentally, “matter” in this article is always to be understood as the basic participant. It is identical with so-called “intelligible matter” in the transsensible world and with “prime matter” in the sensible universe.
- Proclus’ interest in linking matter specially and directly with the One and the henads issues from his interest in magic and theurgy—see Dodds, *op. cit.*, pp. xxii sq., 267, 275–276. On theurgy also see E. R. Dodds, “Theurgy and Its Relationship to Neoplatonism,” *The Greeks and the Irrational* (Berkeley: University Press, 1951), pp. 253 sq.; C. Zintzen, “Die Wertung von Mystik und Magic in der neuplatonischen Philosophie,” *Rheinisches Museum* 108 (1965), 71–100; J. Trouillard, *L’un et l’âme selon Proclus*, pp. 71, 171–189; Andrew Smith, *Porphyry’s Place in the Neoplatonic Tradition* (The Hague: Martinus Nijhoff, 1974), pp. 111–121.
31. ἐπιτηδεύτης . . . πρὸς τὴν μέθεξιν τῶν αἰτίων. The first noun also occurs in 72. 68. 22. See E. R. Dodds, *Elements*, pp. 344–345.
32. For interpretations of Proposition 72, see Dodds, *op. cit.*, pp. 238–39; L. J. Rosán, *Philosophy of Proclus*, pp. 107, 191–192; P. Bastid, *Proclus*, pp. 239–40.
33. Lines 27–30 and 31–32: καὶ ἀπ’ ἐκείνων πρόεισιν, οὐχ ἡ ἀμέθεκτόν ἐστι. ταῦτη πρόεισιν, ἀλλ’ ἡ μετέχον. ἀπ’ ὧν γὰρ ὡριμνται, τοῦτων δήπου μετέχει, καὶ ὧν μετέχε, ταῦτα οὐκ ἔστε πρώτως . . . ἡ μὲν γὰρ ἀπ’ αἰτίας, μετέχον ἐστὶ καὶ οὐκ ἀμέθεκτον.
34. Lines 10–11: καὶ ἡ μὲν ἀπὸ τοῦ ἐνὸς πᾶσαι, οὐδεμία τούτων ἀπῆ ἐστιν, ἀλλ’ ὥς ἀπ’ ἀρχῆς ἐκείνης.
35. Lines 31–34 and 35 sq.: Πᾶσα ἐνὰς συνυφίστησι τῷ ἐνὶ τὸ μετέχον αὐτῆς ὄν. τὸ μὲν γὰρ ἐν, ὥς πάντων ἐστὶν ὑποστατικόν, οὕτω καὶ τῶν ἐνάδιον τῶν μετεχομένων καὶ τῶν ὄντων τῶν εἰς τὰς ἐνάδας ἀνηρημένων αἰτίων . . . ἀπλῶς μὲν εἶναι τοῦ ἐνὸς ποιούντος, τὸ δὲ συμφυές εἶναι τῆς ἐνάδος ἀπεργαζομένης. ἡ ἐστὶ συμφυές.
36. “Causing by one’s very being” does not demand that the cause itself be a being, obviously, since henads are such causes and they transcend being. It is, then, the same as “causing by being what they are,” “causing by the very fact that they are what they are.” By the very fact that a

henad is a goodness and a unity, it communicates goodness and unity. By the very fact that an intelligence is eternal and unmoved, it produces what is eternal and immutable (76. 72. 7–12; 172. 150. 15 sq.). By the very fact that a soul is self-moved and living, it communicates self-movement and life to bodies (20. 22. 9–10; 196. 170. 20–21).

Manifestly, such causality is natural (literally), inevitable, spontaneous, and necessary. See Jean Trouillard, “Agir par son être même: La causalité selon Proclus,” *Revue des sciences religieuses*, 37 (Oct., 1958), 347–357; *idem*, *L’un et l’âme selon Proclus*, pp. 92–97.

37. Those characters seem to be what Proclus intends in 137. 122. 2–3. But they could be the participations spoken of in Props. 120–122. The former interpretation seems more likely, however.
38. Of course, if the effect is really distinct from the cause, if matter is really other than the One, if Proclus’ *Weltanschauung* is not a monism, then the One would seem to create matter by making it actually exist.

On creation in the *Liber de Causis*, written by an anonymous Semite in the eighth or ninth century A.D., but joining a doctrine of creation to Proclus’ theory of causality, see Leo Sweney, S.J., “Doctrine of Creation in *Liber de Causis*” in ed. C. O’Neil, *Etienne Gilson Tribute* (Milwaukee: Marquette Univ. Press, 1959), pp. 274–289; also see *idem*, “*Esse Primum Creatum* in Albert the Great’s *Liber de Causis et Processu Universitatis*,” *Thomist* 44 (1980), 599–646.

39. On vertical and horizontal causalities, see Note 24, above, and Diagrams One and Two.

## *Introduction*

Ever since Christians began to reflect on their faith, to express and explain it both to themselves and to others, they have availed themselves of the intellectual means which appeared to be suitable for this and which had been developed by the philosophical movements of their time. The use made of Stoic, Cynic, and Platonic conceptions in Saint John and Saint Paul is well known. Even a writer such as Tertullian, who vigorously condemned philosophy, can be found to be articulating the Christian message with the help of pagan philosophical concepts, and those Christians who favored taking advantage of philosophical ideas had no difficulty in elaborating a scripturally based justification of their practice.<sup>1</sup>

The intellectual system that many influential early Christian thinkers made most use of was Platonic philosophy in the eclectic (Aristotelianizing and Stoicizing) form in which this philosophy was understood and widely taught in the early centuries of the Christian era<sup>2</sup> and in particular in the coherent and inspiring structure given this eclectic Platonism by Plotinus (ca. A.D. 204–270) and by his many no less influential followers, Porphyry (ca. A.D. 232–305), Iamblichus (ca. A.D. 245–326), and Proclus (ca. A.D. 412–485), to name but a few.<sup>3</sup> The interest

of early Christians in Platonism had to do not merely with the fact that it was the dominant and by far the most lively philosophical movement of late antiquity. As a philosophy, it also seemed to have more in common with Christian belief than did other philosophies. Saint Augustine, for example, tells us in his *Confessions* that "when I recorded how I had read certain books of the Platonists, . . . he [Simplicianus, who succeeded Saint Ambrose as Bishop of Milan] congratulated me because I had not fallen in with the writings of other philosophers, full of fallacies and deceits according to the elements of this world, whereas in the works of the Platonists God and his Word are introduced in all manners" (VIII, 2, 3, trans. Ryan).

Although it might appear that Aristotelianism displaced Platonism in the later Middle Ages as a privileged philosophy in Christian thought, it did so as a philosophy enriched with fundamental Neoplatonic insights.<sup>4</sup> Indirectly, through the works of Gregory of Nyssa, Ambrose, Augustine, Pseudo-Dionysius and others, Neoplatonism exerted great influence not only on medieval Christianity but also on all Christians who ever since, consciously or not, have been indebted to these thinkers. Since the revival of interest in Plotinus and his school in the Renaissance, direct access to the original Neoplatonic texts has strengthened the presence of Neoplatonic ideas in Christian thought. This presence in recent times is perhaps less easily discerned on a surface troubled by the swift waves driven in rapid succession by contemporary movements in philosophy and the social sciences, but, as several papers in this volume indicate, it is far from losing its living appeal to Christian thinkers.

The relationship between Neoplatonism and Christianity, as indeed the relationship between any philosophy and a religion, raises many questions of different kinds, not the least of which challenges such a relationship. From the point of view of the historian, the presence of Neoplatonic ideas in Christian thought is undeniable. But how should we go about identifying precisely and measuring this presence? To what extent did particular Christian writers actually read and make use of particular Neoplatonic texts? To what extent and in what ways were Neoplatonic conceptions influential in a Christian writer's reflection on his faith? Did those conceptions contribute significantly or only superficially to the development of theology? If significantly, should they, from a theologian's point of view, be discarded or should they be preserved, and if so, on what basis? Since a relation between a philosophy and a religion is in question, is there subversion of the philosophy in a religious appropriation of its theories, or is there subversion of the faith in a philosophical interpretation of revealed truths, so that both from a philosophical and from a religious standpoint, the relation can only be either superficial or undesirable? Since both philosophy and religion make truth-claims, might there not be some structure of harmonization?

Modern approaches to dealing with these and other relevant questions have tended to become increasingly fragmented and complex as a result of considerable expansion in the study both of Christian thought and of Neoplatonic philosophy in a variety of different disciplines and as a result of advances in critical method in these disciplines, which make superficial answers no longer acceptable.<sup>5</sup> It was

therefore decided by the International Society for Neoplatonic Studies and The Catholic University of America to cosponsor a Conference on "Neoplatonism and Christian Thought" in 1978 which would serve to bring together scholars in different disciplines who could thus review in common the results of contemporary research in the field, discuss remaining problems, and identify new lines of investigation. The present volume includes papers delivered at this conference. Of course not every area could be covered by the participating scholars, nor could final solutions be presented for all the relevant problems. However, the papers of this volume constitute a conspectus of contemporary studies in this rich field, present advances in the field, and, it is hoped, will provide a focus and stimulus for further discussion and research. In what follows I will attempt to note briefly some of the points made in these papers, organizing my account roughly with reference to the sequence of questions presented above as likely to arise with respect to the relationship between Neoplatonism and Christianity.

\* \* \*

There have been several accurate studies of the knowledge and use of specific Neoplatonic texts in the great Christian writers of the fourth century—Basil, Gregory of Nyssa, Marius Victorinus, Ambrose, and Augustine.<sup>6</sup> In his paper Father Henri-Dominique Saffrey continues his earlier work providing *precise* evidence of the debt of the influential sixth-century Christian writer known as (Pseudo-) Dionysius the Areopagite to the philosophy of Proclus. He presents a critique of the sorts of doctrinal rapprochements between Pseudo-Dionysius and Neoplatonism that are, in terms of historical method, inadequate<sup>7</sup> and then characterizes what can count as an "objective link" between Pseudo-Dionysius and a Neoplatonic source: links in vocabulary, in intellectual structures, and especially those links betrayed by the earliest commentator on Pseudo-Dionysius, John of Scythopolis, in his attempts to explain unusual (Neoplatonic) expressions in the Dionysian writings. One such expression which Saffrey shows as deriving from Proclus is that referring to divine names as "statues." Saffrey also uncovers two quotations from Proclus in Pseudo-Dionysius and suggests that much more remains to be done in establishing objective links between Pseudo-Dionysius and Proclus.

If in some cases precise links can be established between Neoplatonic and Christian texts, in others large gaps in the surviving evidence necessitate a more tentative treatment. Professor John Dillon's paper takes up a doctrine in Origen (ca. A.D. 185–254) concerning the Trinity, which represents God the Father's power as extending to all that exists, God the Son's as extending only to living beings, and the Holy Spirit's extending only to the "saved." He finds a similar doctrine concerning the range of activity of causal principles in Proclus' *Elements of Theology*, a much later (fifth century) Neoplatonic text, but suggests grounds for assuming, nevertheless, that Origen's doctrine must be an adaptation of an originally Platonic doctrine, evidence for the existence of which in Origen's time is lacking but which may well have been part of a Middle Platonic system.

In considering Origen's doctrine to be an adaptation of a Platonic doctrine, one is not only referring to the Platonic sources, but one is also raising the issue

as to how this Platonic doctrine was made use of by Origen in a Christian context. Professor Jean Pépin considers the question of the adaptation of Middle and Neoplatonic ideas in relation to a wide range of early Christian writers and with respect to the similarities between their interpretation of the figure of Ulysses and the interpretation of Ulysses in Platonic texts. He shows that in its emphasis on the Ulysses of the *Odyssey* and in its "metaphysical," and thus more allegorical exegesis, the Platonic interpretation resembles Christian interpretations and constitutes a new approach in comparison to the moralistic interpretation of the figure of Ulysses in Cynic and Stoic philosophy. However, if indebted to Platonism in its interpretation, for example, of the sea of the *Odyssey* as the tempting world, of Ithaca as the fatherland of the soul, Christian interpretation also introduces specifically Christian features: Ulysses' ship is seen for instance as the image of the Church, the mast as a symbol of the cross.

Mother Mary T. Clark also considers the question of the Christian use of Neoplatonic ideas in her study of Marius Victorinus' Platonic-inspired interpretation of the Trinity. She argues that Victorinus' understanding of the Trinity was fundamentally scriptural and that he made use of the philosophy "best adapted to convey the possibility of a triune God," that is, Porphyrian rather than Plotinian Platonism, in the context in particular of dealing with the philosophically deficient Trinitarian formulations of Arians and Neo-Arians. Porphyry's philosophy thus had the limited role for Victorinus of providing a philosophical defense of the coherence of a doctrine, itself, however, based on interpretation of Scripture.

In relation to a personality as subtle and complex as that of Saint Augustine, discussion of the Christian use of Neoplatonism must take account of several different levels of use and a variety of different interests guiding this use. Professor John O'Meara reviews scholarship on some of the problems concerning Augustine's Neoplatonism and draws attention in particular to the moral and emotional importance to Augustine of Plotinus' account of the *conversio*, or turning, of the soul to God, the interest for Augustine of Porphyry's search for a "universal path to the liberation of the soul," and the little-recognized use made by Augustine of Plotinian negative theology. O'Meara concludes that the complex and sometimes conflicting tendencies of Augustine are reflected in Augustine's attitude toward Neoplatonism, which he rejected in its opposition to the doctrines of the Incarnation and Resurrection but which also provided him with a "rational understanding of the problems and mysteries of Christian theology."

Professor Guy Allard's study of the lexicographical, gnoseological, and ontological primacy of existence in the thought of the ninth century philosopher John Scottus Eriugena (or John the Scot) shows how, in his commentary on Pseudo-Dionysius, Eriugena reinterprets and modifies the Dionysian texts, replacing Neoplatonic essentialism with a metaphysics in which God is understood as existence, pure activity, the creator (not a Platonic demiurge) of the existence of essences in which these essences become knowable. In this radical modification Allard sees the philosopher and theologian in Eriugena working as one, bringing out what was to be a major theme in Thomas Aquinas.

Another case of reinterpretation or modification of Neoplatonic ideas, this

time in relation to Aquinas, is examined by Father Cornelio Fabro. He discusses Aquinas' commentary on the *Liber de causis* (a medieval Arabic work based on Proclus' *Elements of Theology*) and the late incomplete work *De substantiis separatis* with a view to analyzing Aquinas' absorption and critical reshaping of Neoplatonic metaphysics, in particular of the Neoplatonic metaphysical triad Being-Life-Intellect.<sup>8</sup> He shows how Aquinas, using Proclus' *Elements of Theology* and Pseudo-Dionysius, brings out the absolute dominion and unique creative act of Being, as *ipsum esse subsistens* (God), and how he gives to the principles of life and intellect a formative (noncreative) causality, thus reshaping the Neoplatonic triad on metaphysical grounds in support of which he could refer to his Neoplatonic sources.

Professor Bernard McGinn's paper on Meister Eckhart (ca. 1260-1327) is a study of Christian use of Neoplatonic dialectic. Three problems in the interpretation of Eckhart's doctrine of God are taken: the priority of understanding to existence in reference to God in some texts and the priority of existence to understanding in others; the distinction between God and the Godhead and the separation this appears to introduce in the divine nature; the meaning of Eckhart's conception of the birth of the Word in the soul. Predication, analogy, and dialectic are then explored as three levels of "increasing depth" in Eckhart's presentation of God and as a way of approaching a resolution of the first of these problems. Finally McGinn discusses aspects of the Christian use of Neoplatonism as this relates to the potential value of Neoplatonic dialectic to Christian reflections on the transcendence and immanence of God.

Discussing a much more recent writer in relation to a broad conception of Neoplatonic ideas and their role in serving to structure Christian beliefs, Professor Elizabeth Bieman traces Robert Browning's "lifelong quest for God and truth" as expressed in his poetry and as this quest develops in three phases, beginning in a search for the absolute truth denied to fallen man, passing through a theological expression of the Incarnation, and ending in an awareness of man's epistemological limitations and of the rewards of the search for truth. She brings out in these phases of Browning's quest the role played by the triad of Power, Love, and Knowledge (the third term linking the first two, opposed, terms) which she suggests can be associated in Browning with the persons of the Trinity.

Finally, Professor Mary Rose examines in her paper how Christian Platonism informs the literary activity of C. S. Lewis, J. R. R. Tolkien, and Charles Williams. She provides evidence that all three writers can be considered orthodox Christians and then brings out the use made in their works of three Platonic themes: the reality of supersensory aspects of creation; the means of acquiring knowledge of these aspects; and, the ideal copresence of Truth, Beauty, and Goodness in all parts of creation. Other Platonic conceptions in these three authors are discussed: psychophysical dualism, otherworldliness, and the hierarchy of being.

If there were many Neoplatonic conceptions that could be used and adapted in a wide variety of ways by Christian thinkers, there were, however, some elements of Neoplatonism that were of doubtful assimilability for a Christian, just as there were Christian doctrines (e.g., the Incarnation of Christ, the resurrection

of the body) which pagan Neoplatonists rejected. Father Norris Clarke examines one Neoplatonic conception which he believes resists coherent assimilation into Christian thought—the conception of a multiplicity of really existent Forms or Ideas as objects of divine thought. In a survey of the treatment of this conception in the Latin West, from Saint Augustine to the fourteenth century, he argues that the conception could not be satisfactorily reconciled by Christian thinkers with the Christian denial of a “plurality in God outside that of the three divine Persons.” He suggests that a resolution to the conflict of these two positions was provided by Aquinas who saw the divine ideas, not as the true being of creatures, but as possessing “intentional” being. The divine intelligence “thinks them up . . . as possible limited modes of participation in his own infinite act of *esse subsistens*.”

Whether or not there are such things as separately existing Forms or Ideas was itself the subject of the great debate about “universals” in Western medieval philosophy. Professor Linos Benakis examines this debate in the form it took in Byzantine philosophy. He characterizes the dominant Byzantine attitude to this question as “conceptual realism” (universals understood as concepts produced through conceptual apprehension of the common characteristics of things). This approach he shows to be indebted to the works of the Neoplatonic school of Alexandria of the fifth and sixth centuries (Ammonius, John Philoponus, and others) that also appears to have influenced Boethius and the Arabic writers who formed the background to Western discussions of the subject. He concludes by pointing to the need for investigation into what contacts there might have been between Byzantine thinkers and the thinkers of the Latin West.

Another conception (both Aristotelian and Neoplatonic) whose consistency with Christian belief was a matter of doubt was the idea that the world never began but exists from eternity. The acceptability of this position was discussed with great vigor and subtlety in the West in the thirteenth century, but many of the arguments, as can be seen from Father Gérard Verbeke’s paper, had already been developed in the Neoplatonic school of Alexandria. Verbeke notes that numerous Christian members of the school did not reject the doctrine of the eternity of the world and that Philoponus, a Christian, attacked the doctrine, not on religious grounds, but on the basis of philosophical arguments drawn from Aristotle. In his reply to Philoponus, Simplicius (an Athenian contemporary of Philoponus) stressed the compatibility in his view of the idea of creation from nothing (an idea found in pagan as well as Christian Neoplatonism) with the doctrine of the eternity of the world. The subject was thus (as it would be later) a matter of philosophical debate within Neoplatonism, irrespective of any problem of theological acceptability that an eternal world might raise.

Professor Henry Blumenthal’s study of the commentaries on the crucial third book of Aristotle’s *De anima* by Philoponus and Stephanus of Alexandria comes to similar conclusions about the extent to which the Christianity of these two commentators affected the positions they took in their reading of Aristotle. Blumenthal shows that the positions they take are explicable in terms of the Neoplatonic tradition, need not be seen as reflecting their Christianity and, in fact, may appear to be at variance on some points with Christian doctrine. He establishes that the

commentaries are two separate works (and not merely different versions of a standard Alexandrian lecture course) and points out that they are really Neoplatonic interpretations of Aristotle and not merely expositions, free of philosophical “bias,” of the text.

If there are aspects of Neoplatonic philosophy and Christian doctrine that appear to be in conflict, a case might still be made for the existence of a common ground and indeed the extreme position could be taken that not only is there no genuine fundamental conflict, but, on the contrary, there is a harmony between Neoplatonism and Christian thought. This last position is found most extensively (if not exclusively) in the Renaissance. Professor Maurice de Gandillac examines two leading Renaissance champions of harmony, Nicholas of Cusa (1401–1464) and Marsilio Ficino (1433–1499). For each author de Gandillac indicates his knowledge of Greek sources and the development of his views concerning the nature of this harmony. In Nicholas of Cusa all religions and philosophies are seen as a spectrum of different insights which can be reconciled in a consistent structure fundamental to which are the doctrines of the Trinity and the Incarnation. Ficino, it is suggested, is concerned less with these doctrines than with proving in philosophy truths (the immortality of the soul, in particular) that prepare the way for religion. However, Christian religion and philosophy (conceived along Neoplatonic lines as an ascent to God) are found to blend into each other in Ficino’s mind.

Professor Charles Schmitt extends our knowledge of the influence of Ficino’s harmonization of Neoplatonism and Christianity in his study of a little-known Renaissance thinker, Andrea Camuzio (ca. 1512–1587). Schmitt discusses Camuzio’s attempt to demonstrate the harmony of Scripture with Plato and Aristotle on the basis of a Neoplatonic conception of philosophy as directed to an end (God) which is also the goal of religion. Camuzio was also however an Aristotelian in certain respects and thus exemplifies two points made by Schmitt—that, contrary to common conceptions, Aristotelianism is the dominant philosophy of the Renaissance and that this Aristotelianism embodies Neoplatonic ideas to a greater degree than is usually realized.

Professor Edward Mahoney examines two ways in which Neoplatonism came to have a special impact on Renaissance Aristotelianism. He shows how the Greek commentators, especially Themistius and Simplicius, were studied by and had influence on the psychology of Nicoletto Vernia (d. 1499) and of his pupil Agostino Nifo (1470–1535), the latter using Ficino’s commentaries on Plotinus to understand Simplicius and seeing in Neoplatonism support for Christian belief. After Nifo, the use of the Greek commentators became widespread in Renaissance Aristotelianism. Mahoney also discusses the continuous debate that took place in Renaissance Aristotelianism about the Neoplatonic conceptual scheme of a hierarchy of being in which God and matter constitute the termini.

It may appear that the attempt to harmonize Neoplatonism and Christian belief is possible only at the price of ignoring certain difficulties and even of abandoning elements that may be thought to be essential either by a Neoplatonist or by a Christian. Professor John Findlay suggests in his paper that both Christianity and

Platonism contribute to "Absolute theory." To the Absolute he ascribes seven "demarkating characteristics": it exists in an unqualified sense, exists of necessity, is unique, is unitary, is capable of having an inner distinction of the essential and inessential, is all-comprehensive, and has room in it for Mind and its guiding values. This Absolute he finds in both Christianity and Neoplatonism. However, he suggests that Platonism's concept of the Absolute is preferable to the Christian concept in that it does not attribute to the Absolute the individuality, contingency, and arbitrariness he finds in the Christian Absolute. The adoption of a (Neo-) Platonic Absolute which he recommends to Christians may be felt by them, however, to entail abandoning central elements of their religion.

However, it must be noted that as there is room within Neoplatonism for different interpretations and positions, so is there a diversity in the ways Christians view their religion and attempt to understand its mysteries." Professor A. Hilary Armstrong argues that certain Neoplatonic ways of thinking are of value to a Christian's attempt to interpret his or her religion in the context of a contemporary religious crisis, which Armstrong describes as a breakdown in the acceptability of claims made for certain "forms of words and ways of thinking about God as timelessly and universally true." In such a context, negative theology is useful in allowing both for the use of language about God and for preservation of a "distance" with respect to such language.<sup>10</sup> He also recommends "mythical" interpretation of systematic theology ("mythical" understood in a Neoplatonic sense as taking account of the "image" status of the ways through which the Unknowable God communicates) and provides as an example a Pseudo-Dionysian view of the Incarnation that emphasizes the cosmic and universal outgoing and return of the Godhead.

\* \* \*

In conclusion, I may be permitted to draw attention to some ideas, primarily methodological in character, which I believe to emerge from the papers of this volume and which may be of use to further inquiries in the field. It is clear, first of all, that the relation between Neoplatonic philosophy and Christian thought, as viewed today by the historian, the philosopher, or the theologian, is hardly a simple one of concord or confrontation between two uniform entities. Christian thought is constituted, as is Neoplatonic philosophy, of many different thinkers with different interests and different approaches in relation to a unity of inspiration. In order then to reach a sound assessment of the historical influence of Neoplatonic philosophy on the development of Christian thought, much work must be done that will bring out specific "objective links" between individual Neoplatonic and Christian thinkers and texts. The critical standards to be met in such work are indicated in Saffrey's paper. In cases such as that discussed by Dillon, lack of evidence may force us to hypothesize. Yet there is hope that such hypotheses may be verified as further advances are made in our knowledge both of the history of Neoplatonism and of the history of Christian thought. Detailed work concentrating on specific texts can be expected to provide a solid basis for historical generalization and has already helped undermine some untested assumptions, a case in point being the demonstration by Schmitt and Mahoney of the unsuspected importance

of Neoplatonic ideas to Renaissance Aristotelians and to their interpretation of their beliefs.

In adopting Neoplatonic ideas, a Christian author is as likely as not to use them selectively (as shown, for example, in Pépin's paper) or even to modify them. The motives guiding such adoption, selection, and modification may not always be easily uncovered, nor the same in every instance. One may need to take account (as is done in O'Meara's paper) of the particular complexity of a personality such as that of Saint Augustine's, of an intellectual and spiritual development such as that traced by Bieman. In the case examined by Mother Clark, it appears that Victorinus selected the Neoplatonic theory that seemed most consonant with Scripture. However, the situation with respect to scriptural and theological motives for selecting or adapting Neoplatonic ideas is sometimes far from simple. As Verbeke and Blumenthal show, a Christian writer might espouse positions for reasons that we would assume are theological but which in fact turn out to be purely philosophical. Indeed, in the cases analyzed by Allard and Fabro, it becomes difficult clearly to distinguish theological from philosophical reasons for the adoption or modification of a Neoplatonic theory by a Christian thinker.

These difficulties in separating theological from philosophical motives serve as a useful reminder that theology and philosophy converge (as the Renaissance well knew) as attempts to reach true understanding of fundamental issues in life. The way in which a Christian thinker makes use of Neoplatonic philosophy represents a position taken in relation to such issues, which means that one must be sensitive to these issues in order to appreciate adequately the position taken by the Christian Neoplatonist in relation to them. Such a position can even present itself as a challenge to one's own possible or actual exploration of these issues.

The meeting of philosophy and theology may also remind us that each of these, as an attempt at understanding, is bound by canons of rational interpretation. If a philosophical theory is selected by a Christian as suitable in a particular religious context, it does not cease for all that to be subject to philosophical critique; and if such a theory is found to be theologically unsuitable, it can only be replaced by another theory which is itself philosophically defensible, as is shown, for example, in Mother Clark's paper. The theologies of today also make use in various ways of contemporary philosophical ideas that may or may not prove philosophically adequate. A perception of inadequacies in these has led some indeed to call for reflection on an older philosophy from which, Armstrong and McGinn suggest, the Christian thinker may derive a better interpretation of his religion.

## ACKNOWLEDGMENTS

For their generous assistance I would like to thank the members of the International Society for Neoplatonic Studies Executive Committee and the members of the Conference Planning Committee; Edward P. Mahoney, who translated Fabro's paper from the Italian (making use of an earlier incomplete translation by

Margaret Calderon); John F. Wippel, who checked my translations of the sections of Aquinas' commentary on the *De causis* quoted in Fabro; and especially Mary Brennan, who translated from the French the papers by Allard, de Gandillac, and Saffrey. I have prepared the translation from the French of Pépin's paper. French versions of the papers by Armstrong and Saffrey have appeared respectively in *Mélanges Trouillard* ed. S. Breton (Paris, 1981), and *Revue des sciences philosophiques et théologiques* 63 (1979); permission to reprint these papers here in English is gratefully acknowledged. Bieman's paper is reprinted with permission from *Cithara* 19 (1980). This volume owes much to Mary Ann Ellery, who prepared the Index, Peter Manchester, and Owen Sadlier. The Conference was supported by a grant from the National Endowment for the Humanities. Translation costs were met with grants from The Catholic University of America and from the International Society for Neoplatonic Studies.

## **PATRISTIC THOUGHT**

## *The Platonic and Christian Ulysses*

JEAN PÉPIN

I

PHILOSOPHOS ODYSSEUS<sup>1</sup>

Several philosophical schools in antiquity made use of the figure of Ulysses. Take the case of the Cynics, to begin with, who put him forward as an *exemplum*. The idea is already suggested in the fifth century B.C. by the founder of the Cynic movement, Antisthenes. Ulysses is for him a sage who knows life, the gods and men—and women!—and who knows how to adapt his speech in relation to different interlocutors.<sup>2</sup> The same kind of evaluation of Ulysses is found two centuries later in Bion.<sup>3</sup> It becomes a literary cliché in the apocryphal letters of the Cynics, which date from the imperial period and which see in Ulysses, notably in his clothes (that is, his rags), the incarnation of the kind of life advocated by Cynicism.<sup>4</sup> It was to be expected that the Stoics, who admitted to being under Cynic influence in their ethics, would in turn choose Ulysses as a model of morality. In fact, no trace of this is found in the documents relating to the founders of Stoicism, but it is a well-established idea in the Stoics of the imperial period: Seneca, then Epictetus, and in two texts influenced by Stoicism that probably date from the first

or second century A.D., the *De vita et poesi Homeri* of Pseudo-Plutarch and the *Quaestiones homericæ* of Heraclitus. In these texts we find a Ulysses extolled because of his endurance, his indifference to pain, his contempt for pleasure.<sup>5</sup>

Parallel to this Cynic and Stoic tendency, there developed another philosophical use of Ulysses, of which I would like to give a representative sample. The reader must forgive the length of this passage in view of the fact that I will use it in the following pages as a point of comparison. It concerns the episode of the Sirens, which Plutarch prides himself in using to show that there is no conflict between Homer and Plato (*Republic* X, 517B):

Now Homer's Sirens, it is true, frighten us, inconsistently with the Platonic myth; but the poet too conveyed a truth symbolically, namely that the power of their music is not inhuman or destructive; as souls depart from this world to the next, so it seems, and drift uncertainly after death, it creates in them a passionate love for the heavenly and divine, and forgetfulness of mortality; it possesses them and enchants them with its spell, so that in joyfulness they follow the Sirens and join them in their circuits. Here on earth a kind of faint echo of that music reaches us, and appealing to our souls through the medium of words, reminds them of what they experienced in an earlier existence. The ears of most souls, however, are plastered over and blocked up, not with wax, but with carnal obstructions and affections. But any soul that through innate gifts is aware of this echo, and remembers that other world, suffers what falls in no way short of the very maddest passions of love, longing and yearning to break the tie with the body, but unable to do so. (Trans. Sandbach)<sup>6</sup>

Although Plutarch puts this passage in the mouth of the Platonic speaker in his dialogue, the exegesis thus presented is not specifically Platonic, but is Pythagorean, as can be seen from some comparisons.<sup>7</sup> There were, therefore, at a time which is hard to determine, Pythagoreans for whom the song of the Homeric Sirens represented the planetary music that entralls souls after death and agitates them already in this life, on the condition that their ears are not sealed by carnal passions as wax blocked the ears of Ulysses' companions.<sup>8</sup> This exegesis must also have been a very significant part of a larger whole that is only partially known, that is, the allegorical interpretation of the figure of Ulysses in the Pythagorean tradition.<sup>9</sup> It is likely that this Pythagorean Ulysses influenced the image that the later followers of Plato would have of the Homeric hero, an image some aspects of which will be traced in the following pages.

In looking back over what has been noted about the way in which the Cynics, Stoics, and Pythagoreans saw the figure of Ulysses, and anticipating what will be seen about its meaning in Neoplatonism, we see a clear difference that, from different angles, separates these four philosophical movements into two groups of two. First, while the Cynics and the Stoics also take into account Ulysses' actions in the *Iliad*,<sup>10</sup> the Neoplatonists and, as far as we can tell, the Pythagoreans concern themselves exclusively with the figure of the *Odyssey*, that is, with his maritime adventures.<sup>11</sup> Further, as we have quickly seen in the case of the former group and as we will see in more detail concerning the latter group, Pythagoreans and Neoplatonists agree to confer on Ulysses a metaphysical dimension—to discover in his legend the history of the soul—whereas the other group confines itself to

extolling him as a moral ideal. Hence the former are forced to make use of an allegorical exegesis which goes far beyond the immediate meaning of the poem,<sup>12</sup> contrary to the Cynics and Stoics who could be satisfied with an almost literal reading.<sup>13</sup>

## II

### THE NEOPLATONIC EXEGESIS

#### 1. Three Stages in a Long Tradition

Ulysses freeing himself from Circe and Calypso, despite their charms, so as to escape to his fatherland, Ithaca, which he loves is Homer's reminder to us to return to our fatherland on high, tearing ourselves away from the beauties of the sensible world. Such is Plotinus' interpretation in his famous treatise *On Beauty*:

This would be truer advice, "Let us fly to our dear country." What then is our way of escape, and how are we to find it? We shall put out to sea, as Ulysses did, from the witch Circe or Calypso—as the poet [Homer] says (I think with a hidden meaning) (αἰνιττόμενος)—and was not content to stay though he had delights of the eyes and lived among much beauty of sense. Our country from which we came is there, our Father is there. (Trans. Armstrong)<sup>14</sup>

Proclus, in turn, sees in Ithaca "that mystical port of the soul (μυστικὸς ὄρμος τῆς ψυχῆς) to which the poet brings back Ulysses after the long wanderings of his life, and to which we rather must return, that is, if we wish to be saved."<sup>15</sup> As to the wandering in which the soul is commonly caught and the ascent which will deliver it, these Proclus discerns in the order of knowledge; throughout this epistemological odyssey, the soul will transcend successively sensations, images, opinions, sciences, discursive reason itself, to reach a "life according to the intellect, which alone possesses stability."<sup>16</sup> Here the progressive return of Ulysses is used as an illustration and guarantee of the hierarchy of knowledge defined in Books VI and VII of the *Republic*. Elsewhere, the same Proclus finds in the sea in which Ulysses struggles the symbol of the world of coming-to-be, whose temptations are embodied by the Sirens. Hence Plato's advice (*Phaedrus* 259A) to avoid the Sirens:

As to souls, who live in the world of coming-to-be, they should "sail past them," imitating Homer's Ulysses—if it is true that the sea also is the image of coming-to-be (θάλασσα γενέσεως εἰκὼν)—so as not to allow themselves to be bewitched (θέλγωνται) by coming-to-be.<sup>17</sup>

Eustathius of Thessalonica, a Byzantine scholar of the twelfth century, has preserved many Neoplatonic allegories concerning the Homeric poems. One of these, on Ulysses and Calypso, coincides substantially with Plotinus' exegesis, but weighs it down with plays on etymology and by establishing detailed correspondences; Calypso, meaning she who "envelops" (συγκαλύπτουσαν), stands for our body, envelope of the soul; she held back Ulysses as the flesh fetters man; if her island is said to be "encircled by currents of water" and "planted with trees," it

is because the body on the one hand is traversed, as Plato says, by a liquid flux, and, on the other hand, consists of a matter similar to wood and dense as a forest; but, Ulysses returns to his beloved fatherland, which, according to the Platonists,<sup>18</sup> denotes the intelligible world, the true fatherland of souls.

## 2. Two Important Texts

### (a) HERMIAS, In *Phaedrus* 259A

Eustathius is a witness to the fact that, nine centuries after Plotinus, there were still readers interested in his interpretation of Ulysses. Of this long history, for which we have just picked out three witnesses who expressly name the Homeric hero, one can find many other traces which are more vague and more limited. At any rate, I have not yet discussed the texts which are most instructive. I must present them now.

One of these texts is found in the commentary on Plato's *Phaedrus* which has been transmitted under the name of Hermias (second half of the fifth century A.D.), but which is inspired by Syrianus, the teacher of Proclus. The passage of Plato commented on is the beginning of the myth of the crickets (*Phaedrus* 259AB), which, paraphrased, follows: At noon the crickets are singing in the trees above Socrates and Phaedrus. Socrates imagines that the crickets are watching them, and that if they saw the two men give in to sleep, as if enchanted by their magic (κηλουμένους), they would mock them; if, on the contrary, Socrates says, they see us "sailing past them as if they were Sirens, resisting their spells, then perhaps they would give us the gift they have from the gods to give to men,"<sup>19</sup> that is, as what follows shows (259C), the privilege of singing until death and then becoming the couriers of the Muses.

This is how Hermias comments on this text:

Just as those, [Plato] says, who are attracted and bewitched (κατακηλούμενοι) by the Sirens forget their own fatherland, so also we, if we give in to the magic of these sights and these crickets and are plunged into sleep, forget our fatherland and our ascent to the intelligible (τῆς εἰς τὸ νοητὸν ἀναγωγῆς). But if we awaken in ourselves discernment and vigilance, if we refuse the attraction of the sweetness of life, we sail past (παραπλέοντες) like Ulysses, we avoid life here below (τὸν ἐνταῦθα βίον), we become worthy of our own fatherland and of our ascent toward the intelligible. "The gift that they have from the gods":—if, then, it were to happen, [Plato] says, that we would be able to sail past the Sirens (παραπλεῦσαι), the Sirens who are in the sensible world (ἐν τῷ αἰσθητῷ κόσμῳ), which is to say the demons who hold back souls in the proximity of coming-to-be (περὶ τὴν γένεσιν), then at that moment the crickets, that is, the divine souls and the gods, seeing us revolting against coming-to-be (γενέσεως) and living like gods, would give us the greatest gift for men, which is to treat us as companions. For as the gods are vigilant in their own activity, so we also should awaken ourselves as far as possible, and it is then that we awaken ourselves, if we reactivate the reason (λόγον) which is in us. The most speculative of the exegetes of the *Iliad* and the *Odyssey* [have said that it is] also the ascent (ἀνοδὸν) [of the soul which Homer has portrayed]; they understand the *Iliad*

thus: it is because the soul fights [so as to leave] matter that [the poet] represented battles, wars and suchlike; as to the *Odyssey*, it is [Ulysses] sailing past the Sirens (παραπλέοντα), escaping Circe, the Cyclops, Calypso, and all the obstacles in the way of the ascent (ἀναγωγὴν) of the soul, leaving them for his fatherland, that is, for the intelligible (νοητόν).<sup>20</sup>

It is clearly the comparison—incidental, fleeting, and, it seems, purely literary—made by Plato ὥσπερ Σειρήνας that led Hermias to have recourse to Ulysses and to his interpretation in Neoplatonism. The weakness of this starting point makes the commentator, especially at the beginning, attribute to Plato much more than he actually says, not indeed without some arbitrariness, since the Sirens and the crickets, united first in that their magic produces in their respective victims forgetfulness of the fatherland, are immediately afterwards set in opposition as maleficent demons and helping divinities. The Homeric exegesis itself appears to conform, as more complete and systematic, to the elements which we found in Plotinus, Proclus, and Eustathius: the difficult return of Ulysses to his fatherland represents the ascent of the soul to the intelligible; the soul is blocked by obstacles corresponding to those which Ulysses had to overcome; among these obstacles, the Sirens represent the lure of life here below, the sensible world, or better, the demons which imprison the soul in coming-to-be. The end of the commentary adds an important piece of information: the Neoplatonists (it is certainly these, or some of these, that are indicated by "the most speculative of the exegetes") apply this framework not only, as one might expect, to the *Odyssey*, but also to the battles of the *Iliad*.

If the allegory developed by Hermias goes far beyond the tiny reference in Plato to the Sirens and imputes to him some adventurous assumptions, nevertheless the passage of the *Phaedrus* has influence on the interpretation of the figure of Ulysses by introducing elements which do not normally appear there; this is the case of the ideas of sleep (to which is related the idea, which is absent from Homer's account of the Sirens, of a forgetting of the homeland), of the awakening of the soul (conceived as a reactivation of the λόγος), of vigilance, of the divine aid assured for souls which imitate the gods and rebel against genesis.

But the principal interest of this page of Hermias is that it establishes a connection between the exegesis of Ulysses and that of *Phaedrus* 259A. Hermias is not the only witness to this connection, which has been pointed out already here in relation to two texts in Proclus,<sup>21</sup> and which might probably be found in many other places. There is one indicator that the source of this connection is earlier in date. For after Hermias, but already before him, many pagan and Christian authors, of whom we will see some examples, wishing (outside all visible reference to the passage of the *Phaedrus*) to make clear that Ulysses avoided the rock of the Sirens and "sailed past," use the verb παραπλεῖν.<sup>22</sup> But if one is to believe the concordances,<sup>23</sup> this verb is absent from the passages of the *Odyssey* dealing with the Sirens, and if it appears in the poem, and then only once,<sup>24</sup> it is in another episode. It therefore cannot have been suggested to these authors by a reading of Homer. For those, such as Hermias and Proclus after him, who refer explicitly to the *Phaedrus*, it is clear that it is from there that they derive παραπλέοντας

σφας ὥσπερ Σειρήνας. But one must suppose that all their predecessors, who have recourse to the same verb when commenting on the Homeric passage from which it is absent, witness in turn to a certain dependence, immediate or at a distance, in relation to the Platonic dialogue. The initiative, illustrated by Hermias and Proclus, of having recourse to *Phaedrus* 259A in order to interpret the Homeric episode of the Sirens should thus be viewed as anterior to the earliest use of παραπλῆειν in this context. We will see presently how far back this hypothesis will allow us to go. One should note also that Hermias and Proclus agree in discerning in the Sirens the evil demons who hold back souls caught in coming-to-be, whereas there is nothing pejorative in the brief mention of them in Plato. If it is true, as I have said above, that the Pythagoreans and Neoplatonists agreed in reading into the navigation of Ulysses the history of the soul, the latter did not keep the imagery that seemed essential to the former and which had the Sirens appearing as soul-guiding and helping musicians.

(b) PORPHYRY, *De antro* 34–35

The other Neoplatonic text which should be studied carefully was written about two centuries earlier than Hermias. It is part of Porphyry's little treatise *De antro nympharum*:

For it is my opinion that Numenius and his school were correct in thinking that for Homer in the *Odyssey*, Odysseus bears a symbol of one who passes through the stages of genesis (γενέσεως) and, in doing so, returns (ἀποκαθισταμένου) to those beyond every wave (κλύδωνος) who have no knowledge of the sea,

"Until you come to those who are unacquainted with the sea,  
men who do not eat food mixed with salt."

The deep, the sea, and the sea-swell are, according to Plato as well, material substance. (πόντος δὲ καὶ θάλασσα καὶ κλύδων καὶ παρὰ Πλάτωνι ἡ ὕλη ὁυστασις). (Trans. Westerink)<sup>25</sup>

The same exegesis continues a few lines further on:

But rather, the man [Ulysses] who had dared these things was pursued by the wrath of the gods of the sea and of matter. (ἀλίων καὶ ὕλικῶν θεῶν) . . . But he will be past all toil when, entirely removed from the sea, he finds himself among souls so ignorant of everything that has to do with the sea, that is to say, with matter (θαλασσίων καὶ ἐνύλων ἔργων), that his oar is thought to be a winnowing-fan, because of the utter ignorance of nautical instruments and activities.<sup>26</sup>

This interpretation of the figure of Ulysses is substantially similar to that found before Porphyry and especially after him. The distinctive character of Porphyry's exegesis is to find in the sea the symbol, not only of the world of coming-to-be, but more widely of matter, doubtless because of the fluid and disorganized nature they share in common. This symbolism is referred back to Plato. Various Platonic texts, all quite distant, might be invoked in relation to this.<sup>27</sup> The nearest text is without doubt the famous myth in the *Politicus* 272D–273E,

where the universe, at certain moments of its existence and in consequence of its corporeal constitution, is compared to a boat buffeted by the storm and very near to sinking "in the bottomless ocean of unlikeness."<sup>28</sup> In fact, the Neoplatonists saw in this ocean the image of matter,<sup>29</sup> and it is therefore this that Porphyry must have in mind. At any rate, Plato is not the source of the idea of personifying the hostile forces of the sea-matter by the gods of that element (Poseidon) bent on destroying Ulysses; however, he (that is, the soul of which he is the image) will triumph in overcoming one by one the degrees of coming-to-be and will be restored to his pristine state.<sup>30</sup> Finally, another aspect peculiar to Porphyry is the skillful reading of the return of the soul to its first condition, not only in the return to Ithaca, but also in the prophecy of Teiresias, whose shade is called forth by Ulysses, that the hero will not receive from Poseidon complete rest until he goes to the people who know nothing of the sea (*Od.* xi. 121–129), in other words, the souls who have not had experience of coming-to-be.

But the important thing in Porphyry is clearly the attribution of this exegesis to Numenius. One may doubt if the reference to Numenius in chapter 34 of the *De antro* extends, as the editors of the fragment believe, to include the reference to Plato. But one is reassured in this regard by another fragment of Numenius that is independent of this one and in which matter, held from on high by the Demiurge, is assimilated (certainly in relation to *Politicus* 272Dff.) in some detail to the sea which the pilot masters from his ship.<sup>31</sup> Thus we are brought back for this exegesis of Ulysses to a period prior to Plotinus—to the first half of the second century A.D.

There might be, perhaps,<sup>32</sup> another indicator of the pre-Plotinian character of this interpretation in a contemporary of Numenius, the Platonic rhetor Maximus of Tyre. The episode of the *Odyssey* concerned is no longer that of the Sirens, as in the majority of the texts we have seen, but the passage in the poem (v. 333–353) where the goddess Leucothea takes pity on Ulysses against whom the elements rage, and gives him a veil which, stretched under his chest, will serve as a life belt. Maximus finds in this scene the image of the philosophy which saves the human soul plunged into the tempest of the sensible world and ready to succumb:

Thrown into the tumult here below and abandoning itself to the irresistible waves which carry it, the soul swims in an adverse sea, until philosophy itself takes it under its protection by slipping under it<sup>33</sup> its arguments, just as Leucothea did for Ulysses with her veil.<sup>34</sup>

This interpretation of Ulysses as the symbol of the soul which is not resigned to its fall is very similar, despite the differences, to Neoplatonic exegesis, and could thus be its earliest formulation.

### III CHRISTIAN EXEGESIS

#### 1. Main Features

Parallel to the Platonic tradition, appearing almost at the same time as it and also lasting for several centuries, there evolves a Christian reading of the figure of

Ulysses, of his navigation and especially of his victory over the Sirens. One will not be surprised to find that Christian exegesis made use here of pagan materials, just as did the Christian art of the time.<sup>35</sup> It even goes beyond the pagan sources in that it systematically confers an allegorical meaning on all of the details of the Homeric episode, whereas the Platonists left some details in the shadow. Here are the principal elements of this new exegesis.

The sea in which Ulysses struggles represents the world in the Johannine sense of that word, the hostile *saeculum* whose pleasures are represented by the Sirens. The rock to which the latter lure the sailors symbolizes the body on which is broken the discernment of spiritual intelligence. Ithaca is the celestial fatherland (paradise) to which we must return, escaping from here and living the true life; the means of return is the Church, a traditional image of which is a ship.

Up to this point, with the exception, obviously, of the last idea, the exegesis of Christian authors is not specifically Christian. But it becomes so with the meaning it gives to the figure of Ulysses. Certainly, as before, he embodies the human condition, but also much more: tied to his mast which symbolizes the Cross, he represents the crucified, and, with less emphasis, the Christian saved by the wood, and even all of humanity. His companions are to be understood as the more distant adherents to whom, however, the shadow of the Cross reaches, such as the good thief. Finally, even the wax stopping up their ears is given meaning; that is, it represents Scripture.

## 2. The Main Texts

This detailed description corresponds to the final complete stage of Christian exegesis, as it is found in the fifth century A.D., and where a place is found for almost all the elements of the Homeric story relative to the Sirens. But this fairly late stage was naturally preceded by attempts that were less complete.<sup>36</sup>

One of the earliest attempts was that of Clement of Alexandria (late second to early third centuries A.D.). For him the Sirens represent the misdeeds of habit and the lures of pleasure, and Ulysses who fools them by tying himself to his mast is the image of the Christian who triumphs over perdition by clinging to the wood of the Cross.

Let us flee (Φύγωμεν), then, habit (συνήθειαν): let us flee it as we would a dangerous promontory, the menace of Charybdis, or of the Sirens of legend. Habit strangles man, turns him away from the truth and from life, is a trap, an abyss, a ditch, it is a keen evil.

"Far from this smoke, far from these waves take  
Your ship."

Let us flee (Φεύγωμεν), then, my sailor companions, let us flee these waves, they vomit forth fire; there, there is an accursed island on which are piled bones and corpses; in that place a bold courtesan (that is, pleasure) sings, delighting in vulgar music:

"Come here, famous Ulysses, supreme glory of the Achaeans!  
Halt your ship to hear ■ more divine voice."

She praises you, sailor, speaking your great fame, and she seeks, this prostitute, to capture him who is the glory of the Greeks. Leave her to feed on her corpses; a heavenly wind (πνεῦμα οὐράνιον) comes to your aid. Sail past pleasure (πάριθι τὴν ἡδονήν), it is a deceiver:

"Neither let a lewd woman make you lose your mind;  
Her flattering chatter is only interested in your barn."

Sail past (παράπλει) this song, it produces death. Just want it (ἐάν ἐθέλῃς) and you will conquer perdition. Chained to the Wood, you will be delivered from all corruption; you will have for pilot the Word (λόγος) of God; you will reach the port of the heavens, thanks to the Holy Spirit (τοῖς λιμέσι καθορμίσαι τῶν οὐρανῶν τὸ πνεῦμα τὸ ἅγιον). Then you will contemplate my God; you will be initiated into these sacred mysteries; you will enjoy these realities hidden in the heavens and which I keep, "which no ear hath heard and which have not risen to the heart" of anyone.<sup>37</sup>

The first point that strikes one in this text is the attack on habit, συνήθεια, which seems unduly vehement. In fact, Clement indicates by this word the weight of pagan traditions which chain the Greeks to their religious practices, notably to the cult of divine images, and which prevent them from adhering to the Christian truth, which is something new: "One pushes one to the abyss, that is habit; the other raises one to heaven, that is truth."<sup>38</sup> It should be noted too that the denunciation of habit, nurse of vice, belonged to the literary genre of protreptics,<sup>39</sup> among which figures, even in its title, Clement's work. These two circumstances make less surprising the offensive he mounts against συνήθεια, to the point of making it the main subject of the allegory of the Sirens (and also of Charybdis). As to the other danger which the Sirens represent, it is pleasure: especially, it seems sexual pleasure, since the Sirens are given the traits of a tempting prostitute who solicits by means of song and flattery. Ulysses is exhorted to flee this song of death in terms that seal his transposition into Christianity: the wood to which he chains himself prefigures that of the Cross; the divine Word is at his rudder; the Holy Spirit which is at first a puff of wind, πνεῦμα οὐράνιον, fills his sails and pushes him to the port of salvation.

We can see that Clement picks out here the positive aspects of the figure of Ulysses. It is quite different some pages earlier where the same author, opposing to the believers in love with eternal salvation the others who mock it, places the latter under the patronage of the Greek hero:

But the others, stuck to the world like seaweed stuck to the rocks in the sea, make little of immortality, and, in the manner of the old man of Ithaca (καθάπερ ὁ Ἰθακήσιος γέρον), take as object of their desire, not the truth nor the heavenly fatherland, nor further the true light, but . . . smoke.<sup>40</sup>

The portrait of Ulysses on which this text is based is the product of bringing together some verses taken from the first books of the *Odyssey*: i, 57–59 (held

back by Calypso, Ulysses, who wants only to see again the smoke of Ithaca, calls for death); v. 135–136 and vii. 256–257 (Calypso in vain makes an offer to Ulysses to keep him from death and old age, ἀθάνατον καὶ ἀγήραον); and v. 203–209 (Ulysses wants to return to his terrestrial homeland, ἐς πατρίδα γαῖαν, instead of becoming immortal). Ulysses' refusal to escape old age explains in part the curious circumlocution which Clement uses in referring to him as "the old man of Ithaca," but this formula must also have the purpose of emphasizing, as expressed in one of its major heroes, the oldness of paganism whose inertia blocks the arrival of the newness of Christianity. In other words, Ulysses is enrolled here in the camp of perverse "habit," whereas, on the contrary, in the text cited earlier, he escapes from its grasp under the cover of his flight far from the Sirens. We can see that Clement is a master of allegorical practice, of which one of the axioms is that the same mythical figure can produce many different, even opposed, interpretations. Besides, we might note that Clement's stern evaluation of Ulysses' sacrifice of immortality in order to return to Ithaca and to see its smoke again takes the opposite tack to the praises conferred on him in the Stoic tradition, which sees in this same behavior the proof of the hero's moderation and of his love for his fatherland.<sup>41</sup>

As for the Sirens, another interpretation can also be found in Clement, who sees them as the image of pagan Greek culture in its relation to Christian catechesis: the converts registered to receive baptism fear lest the melodious pagan knowledge, like the Sirens, block their way to the faith, and they prefer, like Ulysses' sailors, to stop their ears with corks of ignorance. But their instructor will not imitate them in their summary refusal; he will know how to select from pagan culture elements of use to catechesis, on condition that he does not dally with it and does not compromise his return to the Christian philosophy which is his fatherland. It is understood that he will profit by the song of the Sirens without losing himself in it; he will take Ulysses as his model. These preliminaries prepare us for reading Clement's own text:

But it appears that most of those who register themselves, just like Ulysses' companions, hold to the word like peasants. They pass by, not the Sirens, but their harmony and their music; it is from ignorant prejudice that they stop their ears, knowing well that if they listen only once to the teaching of the Greeks, they will never be able to return. But he who selects from it, on behalf of the catechumens, what is useful, especially if they themselves are Greeks ("the earth belongs to the Lord and all which fills it"), he does not have to abstain, as do irrational animals, from the love of knowledge. He should rather collect from it as much help as possible for his flock. This is on condition, however, that he does not become attached to it, only for the use that can be made of it, so as to be able, once the borrowing is done and becomes his property, to return in himself to the true philosophy, in possession of that solid conviction of the soul which is security guaranteed by all means.<sup>42</sup>

There is a noteworthy appreciation of the song of the Sirens in this praise of Ulysses who listened to it without succumbing to it and in this reproof of those who did not wish to (in reality, who could not) hear anything. Other Christian authors would again see in the song the image of the seduction of pagan culture

and philosophy, but most often only to reject these entirely,<sup>43</sup> or to reduce them to the vanity of fine speech.<sup>44</sup> Clement was less original when the call of the Sirens evoked for him the call of the pleasures of the senses. One might note again, at any rate, that in the case of the Sirens, as before in the case of Ulysses, he does not neglect to subject the same mythical figure to different allegorical interpretations.

We will spend less time with the Fathers of the Church who, in various ways, took up and extended the great exegesis in *Protrepticus* XII. They do not in any case require as much attention on this point. A few years after Clement, Hippolytus of Rome, in his account of Basilides the Gnostic, reminds us of the episode of the Sirens, after he had named quickly the mythical monsters of the sea around Sicily—the Cyclops, Charybdis, and Scylla. The sea-crossing full of obstacles is now that of the Christians in the midst of the doctrines of the heretics. Let the Christians use as a model the cunning Ulysses, who fills the ears of his companions with wax, whereas he himself, tied to the mast, "sails past the Sirens without obstacle" (παραπλεῦσα ἀκινδύνως τὰς Σειρήνας) while clearly hearing their song. The weaker will not listen to the heresies, which are quite able to drag them where they wish; but the man of faith will hear them without being disturbed as long as he is chained to the wood of Christ.<sup>45</sup> This last phrase (ἐαυτὸν τῷ ξύλῳ Χριστοῦ προσδήσαντα), which assimilates the mast of Ulysses to the Cross of Christ, is taken almost word-for-word from Clement (τῷ ξύλῳ προσδεδμενός) despite the fact that the two authors give the Sirens a quite different meaning. One will note also that Hippolytus gives value to a detail in the story in the *Odyssey* (the wax in the ears of the sailors) that his predecessor, at least in the *Protrepticus*, did not single out.

The debt to Clement is admitted from the start, near the end of the third century, by Bishop Methodius of Olympus, who indeed calls Ulysses ὁ Ἰθακήσιος γέρον.<sup>46</sup> and explains the latter's behavior by the fact that he wished neither to deny himself the uncontrolled pleasure of hearing the song of the Sirens, nor to expose himself to the death which followed this song. But Methodius uses the Homeric episode mainly as a foil: to the mortal song of the Sirens he opposes the divine and saving voices of the choir of the Prophets and of their interpreters, the Apostles; to hear this song which produces, not death, but a better life, there is no need to block the ears of our companions or to tie ourselves.<sup>47</sup> Besides this completely negative approach, and indeed because of it, we may note that this author, quite different in this from his two predecessors, avoids assimilating Ulysses' mast to the wood of the Cross.

A century later Saint Ambrose takes up the tradition, making himself its first important representative in Latin Christianity. For him the sea is the deceiving world, the *saeculum* (*Quod autem mare abruptius quam saeculum tam infidum?*); the Sirens are the pleasures of the senses which ensnare the mind and sap its strength; the rocks on which they live are the body that softens spiritual keenness; far from blocking our ears, let us open them to the voice of Christ; let us bind ourselves, not like Ulysses hurrying back to his fatherland (*Ulixem illum . . . festinantem ad patriam*), with corporeal bindings to the mast, but spiritually with

the knots of the soul to the wood of the Cross.<sup>48</sup> This entire allegory is in its substance found already in the Greek Fathers, with the exception, perhaps, of the assimilation of the rock of the Sirens to the human body. Ambrose also introduces some innovations in some minor details: among the circumstances delaying Ulysses' return he cites, besides the Sirens, the sweet fruits of the Lotus-Eaters and the gardens of Alcinoüs (*Od.* vii. 112–132; ix. 82–104). As is natural for a Latin author, he mixes into his memory of Homer allusions to Aeneas' navigation according to Virgil (*Aeneid* I. 536 and II. 23). Finally he notes that the prophet also named the Sirens,<sup>49</sup> one of the several mythological allusions he believes are to be found in Scripture.

The Christian exegesis of the victory of Ulysses over the Sirens in a sense reaches perfection in the fifth century in a homily by Bishop Maximus of Turin.<sup>50</sup> Several expressions taken word-for-word from Ambrose show his debt to Ambrose. But he contributes much to this exegesis: the item-to-item correspondence between the episode of the *Odyssey* and its Christian application is now pushed to the limit. In his detailed parallels, Maximus capitalizes on nearly all the contributions of his predecessors and his weakness for rhetorical amplification helps him orchestrate these with ingenuity. The prolixity of these passages makes quotation difficult. In any case, we already know their substance, since my account of the "main features" of patristic exegesis as sketched above is drawn almost exclusively from him. It remains that this last stage in the exegesis represents the completion of some parallels that were only suggested before. Thus Maximus finalizes the correspondence between Ithaca and the *patria paradysi, de qua primus homo exierat*. More important, Ulysses chained to his mast becomes for Maximus the image, no longer only, as before, of the incorruptible Christian, but of Christ Himself on the Cross: to *de Ulixē illo refert fabula quod eum arboris religatio de periculo liberarit* the response is given *Christus dominus religatus in cruce est*.

### 3. *The Relation to Platonism*

This Christian tradition, which lasts from the third to the fifth century, is approximately contemporaneous with the exegesis of Ulysses that we traced from Numenius to Proclus. The differences between these two parallel developments are evident. The most fundamental difference consists naturally in the fact that the Christian truth which is supposed to be found in the myth, or which is at least illustrated by it, is without equivalent in the exegesis of the Platonists. This is clear. But there are also other differences, even if we limit ourselves to the episode of the Sirens.

Christian exegesis, from the beginning, seems to be more complete in that it integrates, and even views as essential, aspects of the legend not picked out by the Platonists. This is the case in relation to Ulysses tied to the mast, the ears of his companions stopped up by wax (we have seen, however, that this last aspect is given meaning when, by amalgamating the Sirens of Homer and of Plato, Plutarch gives an eschatological interpretation of the Sirens with reference to the harmony

of the spheres; but this is, it seems, a Pythagorean and not strictly a Platonic exegesis).

On the other hand, several meanings which Platonic exegesis was fond of introducing are not echoed by the Christians. This is the case for the notion of genesis whose identification with the hostile sea of the *Odyssey* is a constant theme in Platonic exegesis from Numenius to Proclus. Another case is that of the practice, which continues from Hermias to Eustathius, of discerning in the fatherland Ithaca the intelligible world. One should note, however, that these ideas do not fail to evoke fairly close substitutes in Christian exegesis. The deceiving world (*saeculum*) of Ambrose, more merciless than the sea, is not without affinities to the world of coming-to-be from which the Neoplatonists wish to rescue the soul. As for the intelligible world, we know that some later Christians had begun to assimilate it to the Kingdom of God of Scripture, only to blame themselves for this later on.<sup>51</sup> This suggests that the distance can be shortened between the Platonic notion and the "heavens" of Clement of Alexandria, or the "Paradise" of Maximus of Turin.

In saying this we cannot fail to recognize in Clement and his successors the presence of elements found in the Platonic tradition. We can begin with some aspects of vocabulary. We saw above the important clues that are yielded by the use in Hermias and Proclus of the verb παραπλέειν in order to express Ulysses' giving a wide berth to the Sirens. Unless I am mistaken, this word is the sign that the Sirens of the *Odyssey* were interpreted in the light of the Sirens of the *Phaedrus*. But here we find, about two centuries before these pagan authors, the same word παραπλέειν used several times in the same fashion, as we have seen, by Clement<sup>52</sup> and by Hippolytus—a fact that suggests that the contamination I have pointed out (between the *Odyssey* and the *Phaedrus*) originated at the beginning of the third century at the latest. It does not appear that we can push the date back further than this, or at least not further back than Lucian of Samosata, twenty or thirty years earlier.<sup>53</sup>

Another word to note is the present imperative φεύγωμεν used twice by Clement as a sort of retraction, since he used, some lines earlier, also twice, the aorist φύγωμεν. But we found the same word in Plotinus where it is part of a short quotation from the *Iliad*, having as its background a memory of the famous "flight" of Plato's *Theaetetus* 176A: χοῦ ἐνθ' ἐνδε ἐκεῖσε φεύγειν.<sup>54</sup> It is therefore possible to assume the same literary and doctrinal context for Clement's φεύγωμεν, who would again, therefore, have anticipated the Neoplatonists. One can probably find further signs of ■ vocabulary shared in common. Thus, the same verb παρόρχεσθαι is used both by Clement and by Hermias to indicate that we must avoid worldly pleasures.<sup>55</sup>

Other similarities go beyond the level of words and have to do with doctrine. The grandiose symbolism that Christian authors progressively confer on the figure of Ulysses is grafted on an exegetical foundation which is substantially the same as that of the Platonists. For both, the hero embodies man in love with salvation and fighting against the hostile forces that are part of the sensible world. In this perspective salvation is conceived of as a return to the fatherland. As Numenius

strikingly expresses it in a clever use of the very verses of the *Odyssey*, the fatherland's essential characteristic is to be irreducible to the actual world. Furthermore, if this fatherland is so "dear" to us, it is because it was the point of departure before being the point of arrival; πατρίς . . . ὅθεν παρήλθομεν in Plotinus (I 6,8,21) harmonizes in this respect with Maximus of Turin's *patria paradysi, de qua primus homo exierat*. Reestablishment in a place or previous state is what is well expressed by Numenius (or Porphyry) by the use of a word that reminds us of that eschatological reestablishment which is Origen's "apocatastasis." Finally, since the world here below has as its mythical image the ocean, the place of salvation will naturally be represented by a port: when Proclus discovers in Ithaca the μυστικὸς ὁρμος τῆς ψυχῆς, he takes up the allegory in Clement which has Ulysses arrive at τοῖς λιμέσι . . . τῶν οὐρανῶν.<sup>56</sup>

The pilot whom Clement credits with steering towards salvation is none other than the divine Logos; the reactivation of the immanent logos is for Hermias the condition of our awakening, by means of which we approach the vigilance that constitutes the gods. Another fundamental idea common to the two traditions is that the necessary condition for salvation is the desire to be saved; on this point Clement's ἐὼν ἐθέλης μόνον is an exact anticipation of Proclus' ἐὼν ἄρα σώζεσθαι θελωμεν.<sup>57</sup> I will end with a comparison that requires attention, even though it relates only to Origen and not to any of the Christian authors quoted above. The Platonists I have examined above introduce a kind of "demonization of the cosmos":<sup>58</sup> for Hermias the domain of coming-to-be has its demons who imprison captive souls in it. These demons are what the Sirens are. Porphyry previously made note in a similar way of the gods of the sea, that is, of matter, who vengefully pursued Ulysses. We know, on the other hand, that in the cosmogonies of the ancient Near East, including Jewish cosmogony, the apparition of the organized world was conceived as a victory of God over a primordial hostile ocean populated with sea monsters.<sup>59</sup> Early Christianity preserves a trace of this archaic image when it gives the devil the features of a monstrous fish. This is the case notably in Origen and in Ambrose in whom we find expressions such as *cetus, diabolus scilicet*.<sup>60</sup> Why then would not the Sirens, who are also sea monsters, have featured in the *pompa diaboli*? This connection has not left as many traces as one would expect. However, H. Rahner found one<sup>61</sup> in an exegetical fragment of Origen on the Lamentations of Jeremiah, in which one finds the Sirens of the pagan myth identified with corrupting demons. πονηρὰ πνεύματα.<sup>62</sup> How can one avoid comparing this interpretation to that of Porphyry and especially that of Hermias?

These many literary and doctrinal resemblances suggest that these two traditions of exegesis of the figure of Ulysses are not two completely independent totalities. There is nothing to suggest that the Platonists were acquainted with Christian interpretation. It is reasonable, then, to suppose that the latter, especially at the beginning, borrowed from the Platonists elements to which I have drawn attention. This must be the case in particular in relation to Clement of Alexandria: all of the aspects he shares in common with Hermias, Proclus, and so on, show that the Platonic exegesis predates Neoplatonism and that he was familiar with its main lines. Added to what we have seen earlier about Numenius, Maximus of

Tyre, and Lucian, this indicates that the Platonic Ulysses was composed in the second century A.D. The Middle Platonist Numenius, in particular, is very likely to have been one of Clement's sources. Clement knew his work well and is even used as the nearest *terminus ante quem* for the dating of Numenius. Concerning what might be specific to the Middle Platonic Ulysses, we have only the few texts and fragments studied above to go on. Might not Clement provide some supplementary information? In particular, at that place in *Protrepticus* IX where the "old man of Ithaca" is blamed for not having had any desire for the truth, for the celestial fatherland, or for the true light, does Clement have in mind, as has been thought,<sup>63</sup> interpreters for whom Ulysses embodied man striving for these three things? This attractive idea loses its probability when we see that Clement is attacking the Stoic glorification of Ulysses, and not the meaning of Ulysses for Platonists.

#### 4. The Gnostic Ulysses

Without doubt Christian exegesis of Ulysses begins at a period earlier than Clement. We know that the Gnostics were very interested in Homeric myths and their interest in the navigation of the *Odyssey* has left some traces in Hippolytus. Thus, Simon the Mage seems to have referred to the "moly" plant, a magic herb which Hermes gave as a gift to Ulysses in order to counter the evil deeds of Circe.<sup>64</sup> Again, for the Naasenes, Penelope's suitors whose souls are called forth by Hermes stand, in fact, for men whom the action of the Logos brings back from sleep and makes remember (ἐξυπνισμένον καὶ ἀνεμνησμένον) the dignity which they have lost.<sup>65</sup> This Gnostic exegesis is all the more interesting in that the same episode of the *Odyssey* will be given a similar meaning in Neoplatonism, a meaning preserved in Proclus: when Homer speaks of sleep and of awakening, we must understand by this the descent of the souls into coming-to-be and their ascent from it by means of the recollection of true realities.<sup>66</sup> But sleep and forgetting, awakening through the action of the Logos, the fall of souls into coming-to-be and their ascent out of it—these are also the themes thanks to which Hermias interprets the episode of the Sirens in the light of the *Phaedrus*. To come back to the Naasenes, one might remember also that J. Carcopino attributed to them the construction and decoration of a famous grave in the Viale Manzoni, on whose walls are represented, according to him, the return of Ulysses to Ithaca, with Penelope, her loom, and her suitors.<sup>67</sup>

There is indeed a Nag Hammadi treatise (II 6), *The Exegesis on the Soul*, which gives a firsthand example of a Valentinian author of the end of the second century<sup>68</sup> referring to Ulysses' symbolic meaning:

For no one is worthy of salvation who still loves the place of erring (πλάνη). Therefore it is written in the poet: "Ulysses sat on the island weeping and grieving and turning his face from the words of Calypso and from her tricks, longing to see his fatherland and smoke (καπνός) coming forth from it. And had he not [received] help from heaven, [he would] not [have been able to] return to his fatherland." (Trans. Robinson, modified)<sup>69</sup>

There is no doubt but that these lines contain themes which have been met throughout this article. The Gnostic author anticipates Plotinus who also made the break with the same symbolic Calypso the condition of Ulysses' return to his fatherland on high. Furthermore, the definition of the conditions of salvation by means of the union of will (the hate of wandering) and of celestial aid has its equivalent in Clement and in Hermias. As to the traits chosen in the composition of the Gnostic image of Ulysses, notably the homesick desire for the smoke of Ithaca, we have found several of these also in Clement. It is even possible that the immortality that is denied by Ulysses is understood here in the "words of Calypso." All that would be lacking in this sympathetic account is Clement's attack on "the old man of Ithaca." It is true that we have not yet met the striking image of Ulysses sitting on the shore in tears. But this image is not unknown to the philosophers, to Epictetus, for example, who even provides a severe evaluation of it, along the lines used by Clement.<sup>70</sup> In any case, from the fact that the Valentinian treatise's general theme is the fall and the ascent of the soul,<sup>71</sup> there can be no doubt that the allegory of Ulysses in it is controlled by the same inspiration as that which governs the allegory in the contemporaneous Middle Platonists. This glance at Gnostic literature harmonizes with our earlier inquiry into the Ulysses allegory. It is probably the most noteworthy example of a Greek myth for which the Christians were able, at the beginning, to make use of Platonic exegesis, and yet to reach finally a result in which the myth seems made expressly to receive a Christian meaning.

## 2

# Origen's Doctrine of the Trinity and Some Later Neoplatonic Theories

JOHN DILLON

In Chapter 3 of Book 1 of his *Peri Archon*, Origen advances a remarkable doctrine concerning the varying extent of the influences of the three persons of the Trinity. It is one of the doctrines that involved him in some posthumous trouble, a fortunate consequence of which is that we have a statement of it by Justinian, in his *Letter to Menas*,<sup>1</sup> as well as an accurate Latin version by Jerome in his *Letter to Avitus*,<sup>2</sup> a circumstance which frees us from reliance upon the circumlocutions and prevarications of the loyal but cautious Rufinus.

From a Platonist perspective, this doctrine is of great interest, but poses something of a puzzle, as will become apparent presently. First, however, I should like to set out the doctrine as it is presented to us by Justinian who, though hostile, is sufficiently bald and factual to inspire in one the confidence that he is truer to Origen than is Rufinus:

"[Origen declares] that God the Father, in holding together all things, extends his power to every level of being, imparting to each from His own store its being what it is; while the Son, in a lesser degree than the Father, extends only to rational beings

[for he is second to the Father]; and to a still lesser degree the Holy Spirit penetrates only to the saints" [i.e., to the consecrated members of the Christian community]. "So that according to this theory, the power of the Father is greater than that of the Son and the Holy Spirit, and again that of the Holy Spirit is superior to the other holy agencies."<sup>3</sup>

Jerome's only significant variant from this is his description of the Son as actually "less" (*minorem*) than the Father, and the Holy Spirit as "inferior" (*inferiorem*) to the Son,<sup>4</sup> which I take to be, a tendentious distortion of Origen's meaning. Justinian, with creditable attention to accuracy, speaks only of the Son as ἐλαττώτως . . . φθάνων, and the Holy Spirit ἔτι ἡττώτως, which does not. I would maintain, imply the sort of essential subordinationism of which Jerome is certainly accusing him.

Rufinus, of course, is concerned to soften the effect of this troublesome doctrine as far as he, in good conscience, can. If we were dependent on Rufinus alone, we would derive a very muted impression of Origen's theory. Here is his version (*De Princ.* 1, 3, 5):

"I am of the opinion, then, that the activity of the Father and the Son is to be seen both in saints and in sinners, in rational men and in dumb animals, yes, and even in lifeless things and in absolutely everything that exists; but the activity of the Holy Spirit does not extend at all either to lifeless things, or to things that have life but yet are dumb, nor is it to be found in those who, though rational, still lie in wickedness and are not wholly converted to better things. Only in those who are already turning to better things and walking in the ways of Jesus Christ, that is, who are engaged in good deeds and who abide in God, is the work of the Holy Spirit, I think, to be found."<sup>5</sup> (Trans. Butterworth)

The distinction in extent of power between the Father and the Son, as we can see, has been here thoroughly obscured. They are both represented as being concerned with the whole of creation, as opposed to the Holy Spirit's exclusive concern with "the saints." With the help of our other evidence, however, we can, I think, discern what doctrine Rufinus was faced with. The Father alone extends his power "to lifeless things and to absolutely everything that exists," whereas the Son's power extends to all living things, both rational and irrational. The influence of the Holy Spirit, in turn, extends only to that class of rational beings which Origen's Gnostic predecessors classed as "pneumatics," those "saved" individuals endowed not only with soul but with *pneuma*. Origen is prepared to recognize such a class of person; his only objection to the Gnostic position, and it is a vehement one, is that he denies that this class is a closed one—any human being may acquire pneumatic status.

However, I am concerned in this paper not primarily with the significance of this doctrine in Origen's thought, but rather with its possible sources or analogues in contemporary Platonism.<sup>6</sup> To throw any light on this it is unfortunately necessary to move on approximately two centuries, down to the time of Proclus, and then to see if we can work our way back from there to the early decades of the third century.

In Proposition 57 of his *Elements of Theology*, Proclus advances a general principle concerning the range of activity of causal principles that, it seems to me, bears a remarkable resemblance to the doctrine of Origen. For our present purpose, I fear that it will be necessary to quote it in full:

*Every cause both operates prior to its consequent and gives rise to a greater number of posterior terms.*

For if it is ■ cause, it is more perfect and more powerful than its consequent. And if so, it must cause a greater number of effects: for greater power produces more effects, equal power, equal effects, and lesser power, fewer; and the power which can produce the greater effects upon ■ like subject can produce also the lesser, whereas a power capable of the lesser will not necessarily be capable of the greater. If, then, the cause is more powerful than its consequent, it is productive of a greater number of effects.

But again, the powers which are in the consequent are present in a greater measure in the cause. For all that is produced by secondary beings is produced in a greater measure by prior and more determinative principles. The cause, then, is cooperative in the production of all that the consequent is capable of producing.

And if it first produces the consequent itself, it is of course plain that it is operative before the latter in the activity which produces it. Thus every cause operates both prior to its consequent and in conjunction with it, and likewise gives rise to further effects posterior to it. [Corollary:] From this it is apparent that what Soul causes is caused also by Intelligence, but not all that Intelligence causes is caused by Soul: Intelligence operates prior to Soul; and what Soul bestows on secondary existences Intelligence bestows in a greater measure; and at a level where Soul is no longer operative Intelligence irradiates with its own gifts things on which Soul has not bestowed itself—for even the inanimate participates Intelligence, or the creative activity of Intelligence, in so far as it participates Form.

Again, what Intelligence causes is also caused by the Good, but not conversely. For even privation of Form is from the Good, since it is the source of all things; but Intelligence, being Form, cannot give rise to privation.<sup>7</sup> (Trans. Dodds)

The theory presented here can be traced back, as Dodds points out in his excellent note *ad loc.*, as far as Syrianus, who enunciates it in his commentary on the *Metaphysics* (p. 59, 17 Kroll),<sup>8</sup> but no further. Iamblichus, as we shall see in a moment, has a rather different theory, and neither Porphyry nor Plotinus seems to make any use of it.

Proclus' theory is ■ consequence of certain other principles of his metaphysics. First, the principle that *every productive cause is superior to that which it produces* (Prop. 7); then, the immediately preceding proposition to the present one (56), that *all that is produced by secondary beings is in a greater measure produced from those prior and more determinative principles from which the secondary were themselves derived*. His doctrine is securely underpinned by a rigorous logical framework. The supreme principle, which he here terms the Good, rather than the One, in recognition, perhaps, of its causal role, extends its *energeia* to the lowest reaches of creation, even to what is unformed, negations (*sterēseis*), and the chiefest of *sterēseis*, matter itself (this is made clear by Syrianus, in the passage quoted in note 8). The second hypostasis, *Nous*, extends

its influence not just to rational beings, as one might expect, but, precisely by virtue of the fact that it is a higher principle than Soul, which is the life principle, it extends also lower than Soul, to all entities that have Form, animate or inanimate, by reason of its role as bestower of Form. Soul itself, being the lowest of the hypostases, extends least far, taking in only what has life, be it rational or irrational.

It should be plain that, while there are striking similarities between the schemes of Origen and of Proclus (or should we say, of the Athenian school?), there are also considerable differences. The ranges of influence of the three hypostases are quite different in each case. What remains to be decided is, first, whether this theory can be traced in Platonism any further back than Syrianus, and on the other hand, whether Origen's doctrine sounds like something that he devised himself from the whole cloth, or is rather an adaptation of an already existing theory to his own particular requirements.

To take the second problem first, it is surely noticeable that, particularly in the case of the range of influence of the Holy Spirit, Origen's demarcation of influence does not seem to correspond to a natural division in the universe. Traditional divisions would be rather between rational and irrational animals, animate and inanimate objects, material and immaterial being; at the top of the scale pure Unity, at the bottom unformed, undifferentiated matter. Within this scale, and within the known metaphysical scheme of second-century Platonism, it is not difficult to fabricate a plausible triad of principles with concentric spheres of influence. Both Albinus, in the *Didaskalikos*, and Numenius, in his surviving fragments, present us with a triad of First God or Father, Second God or Demiurge (both of these, admittedly, being Intellects of a sort, but the First God being, according to Albinus, also "nobler than Intellect," according to Numenius Intellect "at rest"<sup>10</sup>), and finally World Soul. It would be easy to construct a Platonic theory of spheres of influence, according to which the Father extended his activity to all creation, even as far as matter—there is, after all, a school of thought in Platonism, traceable back to Eudorus of Alexandria,<sup>11</sup> and appearing in the *Chaldaean Oracles*,<sup>12</sup> according to which God is the creator even of matter, while the power of the Demiurge extends to all that which is endowed with Form, it being the Demiurge's particular task to create the material cosmos; the Soul would then extend to all that had soul. The only problem with such a construction is that there is absolutely no evidence for it. And yet Origen's scheme has a distinct look of being adapted to a special purpose. He was presented with a third principle which was precisely not Soul, but Spirit, and Soul and Spirit were sharply distinguished in the tradition from which Origen sprang, going back to St. Paul. The *hagion pneuma* could not be responsible for all that had soul; it could only be responsible for the *pneumatikoi*, the "saints." So Origen had to adapt, even at the cost of incurring the Platonist reproach of splitting up reality like a bad butcher, not at the joints.

Let us turn back to our first problem: what is the ancestry of this theory in the Platonic tradition? I have come upon only one clue, and it is not a very satisfactory one.

In the course of ■ comment on *Alcibiades* I, 115A, Olympiodorus reports, first, the theory of Proclus concerning the extension of influences of the hypostases, and then, in contrast to it, that of Iamblichus:<sup>13</sup>

But the divine Iamblichus does not distinguish the higher principles from the lower by the greater extent of their influence (for all the principles, in his view, extend downwards as far as matter; for this is a dogma of his, that, irrespective of at what point a principle begins to operate, it does not cease its operation before extending to the lowest level; for even if it is stronger, nevertheless the fact of its greater separation can create a balancing factor, rendering it weaker), but he distinguishes them by the fact that the influence of the higher principles is more piercing (*drimutera*). For we strive for Being more basically than for Life, and for Life more basically than for Intelligence.

Iamblichus is actually talking here, not of the three basic hypostases, but rather of the three moments of the hypostasis of *Nous*, Being, Life, and Intelligence, but this does not affect the nature of his argument. The language of Olympiodorus does not admit of certainty, but it sounds to me rather as if Iamblichus is here presented as arguing against a previous view (he is actually presented as arguing against Proclus, which is impossible). If this were so, it would be evidence that the theory goes back at least to early Neoplatonism, and was only revived by Syrianus. Now, in his comments recorded elsewhere, Iamblichus is frequently to be found in opposition both to Amelius and to Porphyry, and with either of these we can find linked the name of Numenius.<sup>14</sup>

However, at this point the trail gives out. We cannot be sure that Iamblichus is in fact contradicting anyone. We are left with the reflection that there is much that we do not know about the doctrines of the three last-mentioned figures, and even less about the mysterious figure who provides a link between Numenius and Neoplatonism on the one hand, and Origen on the other, Ammonius Saccas. All one can say is that the doctrine would fit, not uncomfortably, into what we know of second-century Platonist speculation.

There is another aspect to this theory which, it must be noted, had no attraction for Origen, but did for the later Platonists, and this is the theurgic aspect. The theory speculates that, in a powerful sense, the lower down the scale of nature an entity is situated, the more closely it is linked with higher principles. This provides an excellent philosophical justification for making use of stones, plants, and animals in the performance of magical rituals; they are actually nearer to one god or another than we are, being direct products of the divine realm. Such a theory would accord well with the doctrines of the *Chaldaean Oracles*, another major influence on Neoplatonism from Porphyry onwards, and themselves a second-century production more or less contemporary with Numenius, but once again the available sources fail us. All we find attested, and that only in Psellus' summary of Chaldaean doctrine, is ■ doctrine of *sympatheia*.<sup>15</sup>

I remain convinced, however, that Origen's theory and Proclus' theory are applications of the same doctrine, and that this doctrine was not invented by Origen. Further than that, at the moment, I cannot go.

# A Neoplatonic Commentary on the Christian Trinity: Marius Victorinus

MARY T. CLARK

Marius Victorinus Afer, a famous Roman rhetor, was born in Africa between 281 and 291. He had a fine classical education and an extensive knowledge of philosophy. From Africa he traveled to Rome where he became well known as a teacher of rhetoric. His statue was even erected in the Roman forum. Probably to assist his students, he wrote commentaries on Cicero's works, composed his own treatises on grammar and logic, and translated some key philosophical treatises from Greek into Latin.

Those of us who heard of Marius Victorinus from Saint Augustine's *Confessions*<sup>1</sup> met him there first as the translator of the "books of the Platonists" which Augustine borrowed from a very proud man whose identity has never been completely established. The reading of these books removed some of Augustine's intellectual obstacles to the acceptance of the truth of certain scriptural statements about God. Feeling himself unable to live according to these truths, however, Augustine applied for help to a Christian priest in Milan, Simplicianus (later a bishop), and discovered that he had known Marius Victorinus. Victorinus had discussed his conversion with Simplicianus, telling him how the reading of Scrip-

ture had convinced Victorinus that Christianity should be embraced. One cannot help wondering which scriptural texts influenced Victorinus to believe in Christ. Was it the Prologue to Saint John's Gospel as some have suggested? There he would read: "In the beginning was the Word, and the Word was with God; and the Word was God. All things were made through him, and without him was made nothing that has been made. In him was life, and the life was the light of men. And the light shines in the darkness; and the darkness grasped it not." Pierre Hadot<sup>2</sup> is one who points out that Victorinus could recognize in this Prologue all the Neoplatonic principles: God, Intelligence, Soul, matter, and even certain Porphyrian positions: the Intelligence, originally confused with the First Principle, then distinguished from him; the creation of the intelligible world; the double aspect of the Intelligence or Logos—life, and light; the creation of the sensible world; the role of the soul testifying to the divine presence in the world. Hadot even suggests<sup>3</sup> that the Platonist who was in the habit of saying, according to Simplicianus, that Saint John's Prologue "should be written in letters of gold and hung up in all the churches in the most conspicuous place," was Victorinus himself. On the other hand, H. Dörrie<sup>4</sup> considers that this advice to write large the Prologue in the churches was not given by someone friendly to Christianity but by an anti-Christian Platonist who thought that Christianity added nothing to Platonism. He thought that in John's words Christians would either recognize the heretical character of the Fourth Gospel, or there would be a general conversion to Platonism. But let us consider for the moment that Hadot is right and that Victorinus did recognize the correlation between the Christian and the pagan Divine Logos. This raises the question then as to why Victorinus would bother at all with baptism if he merely recognized the coincidence of Christian and Neoplatonic doctrines in John's Prologue. What Victorinus could know as a Neoplatonist could scarcely be the reason for his believing as a Christian.

## I

I want to suggest that other texts of Scripture deeply moved Victorinus, texts in John and Paul that spoke of the Divine Condescension. His full reading of Scripture made Victorinus aware of the mystery of God's love for mankind and called forth his faith. His later writings show him to be humbled before this awareness of the mystery of God's salvific concern for the world. In his first book *Against Arius*, Victorinus wrote:

For this is "a great mystery": that God "emptied himself, when he was in the form of God," then that he suffered, first by being in the flesh and sharing the lot of human birth and being raised upon the cross. These things, however, would not be marvelous, if he had come only from man, or from nothing, or from God by creation. For what would "he emptied himself" mean if he was-not before he was in the flesh? And what was he? He said: "equal to God." But if he had been created from nothing, how is he equal? That is why it is "a great mystery which was manifested in the flesh."<sup>5</sup>

Plotinus, we remember, had said: "It is not lawful for those who have become wicked to demand others to be their saviors and to sacrifice themselves in answer to their prayers."<sup>6</sup> While this was not an anti-Christian remark on Plotinus' part, but rather witnesses to his conviction that men have a duty to their world and to themselves to live on their highest level, one can find missing here any realization that a savior might volunteer to sacrifice himself even for the culpable man. And Porphyry's philosophy, as far as I know, makes no room for such Divine Condescension.

Despite Victorinus' embracing of the mystery of faith—God's love for man—he remained very Neoplatonic in seeing the Christian life to be the interior life of knowledge, a call to live on the spiritual level. Although the corporal works of mercy undoubtedly belong in the lives of those who wished to follow Christ by doing what he did for people—healing and helping—the importance of Christian spirituality through the ages, that is, the interior life, was definitely directed and influenced by Christian Neoplatonists like Victorinus, Augustine, and Dionysius the Areopagite. Victorinus taught that Christ was universal life, bringing a higher life and knowledge of the intelligible world into the sensible world to lead people to God.<sup>7</sup> Therefore, according to Victorinus, after Christ's death the hidden Christ continues to act in the Holy Spirit, principle of intelligible knowledge. Souls are then illuminated by this hidden Christ, the Spirit of understanding.<sup>8</sup>

Thus, for Victorinus, neither the creation of the world by God nor the incarnation of God's Son diminished the intelligible world. He asserts<sup>9</sup> against Candidus that the process of the sensible manifestation of divine power does not change the divine substance. This procession has reality only in the creatures that benefit from it. In the divine substance itself there is intense activity. All action is derived from the Logos with whom activity is identified: "the first two are one, yet differ insofar as the Father is actual existence, that is, substantiality, while the Son is existential act."<sup>10</sup> With the Logos in the Father, activity is power. This power is deployed through the Logos Father, the maker of the world, and is manifested in a sensible manner when souls (preexisting in the Logos) begin to descend into the sensible world. "For your Logos is the seed of the 'to be' of all things, but you are the interior power of this seed."<sup>11</sup> But there is another work of the Logos which Victorinus finds in Scripture expressing divine concern for the return of souls. This is the sensible manifestation of the Logos, his incarnation, death, resurrection, ascension, and the diffusion of the Spirit into souls. Victorinus expressed it this way:

For the darkness and ignorance of the soul, violated by material powers, had need of the help of eternal light so that the Logos of the soul and the Logos of the flesh after the destruction of corruption by the mystery of that death leading to resurrection, could thus raise up souls and bodies under the guidance of the Holy Spirit to divine and lifegiving intelligences, uplifted by knowledge, faith, and love.<sup>12</sup>

For Victorinus, therefore, the mystery includes the descent of Divine Life through the Son into the world, and the ascent of thought through the Spirit to the Father. Such is the work of the twofold Logos:

For he is life, he is knowledge, in both directions having been efficacious for the salvation of souls, by the mystery of the Cross and thus by life, because we had to be freed from death, and by the mystery of knowledge also, by the Holy Spirit, because he was given as teacher, and "taught" all things and gave "testimony" to Christ.<sup>13</sup>

This is the economy of salvation attainable by faith in the mystery which is the Gospel, the truth of divine love that is good news. To know the mystery is to know the Logos dialoguing with the world; only the Spirit can give this knowledge of the Logos. "The Father speaks to the Son, the Son to the world."<sup>14</sup> And as to the Holy Spirit, Victorinus says that he has "... already set forth in many books that he [the Holy Spirit] is Jesus Christ himself but in another mode, Jesus Christ hidden, interior, dialoguing with souls. . . ."<sup>15</sup>

## II

What then does the Logos give? It seems to have been important for Victorinus that the Son of God can provide a certain positive knowledge of God—a knowledge of his concern for the world he created and saved, and a knowledge of the inner structure of the divine life—which was a closed book to philosophical reason. It is right to recognize that when we try to reason about God, there is more about him that we do not know than we know. But is it possible to quench the desire to know as much as possible about God? Like everyone else, Victorinus had this desire. In his reading of Scripture he at last discovered the source of positive theology. "No one has ever seen God except the only Son who is in the bosom of the Father; he has explained him."<sup>16</sup>

Therefore, although he may have found the coincidence of Neoplatonic and Christian Trinitarian doctrines in Saint John's Prologue, Victorinus searched the whole New Testament to hear Christ explain the triadic nature of the God who "so loved the world."

He found what he was seeking, chiefly in John's Gospel and Paul's Epistles. From the many texts he cites, I shall choose only a few that proved formative of Victorinus' understanding of God as triune.

In John 5:26 he read: "For as the Father has life in himself, even so he has given to the Son also to have life in himself." From this Victorinus learned that the Son was aptly called life and, moreover, was as self-begetting as the Father.

And in 2 Philippians 2:5–7, he read of Christ Jesus "who though he was in the form of God, did not consider being equal to God a thing to be clung to, but emptied himself taking the form of a slave and being made like unto men. And appearing in the form of man, he humbled himself, becoming obedient to death, even to death on a cross. Therefore, God also has exalted him and has bestowed upon him the name that is above every name, so that at the name of Jesus every knee should bend, of those in heaven, on earth and under the earth, and every tongue should confess that the Lord Jesus Christ is in the glory of God the Father."

Again in John 14:26, he read: "These things I have spoken to you while yet dwelling with you. But the Advocate, the Holy Spirit, whom the Father will send

in my name, he will teach you all things, and bring to your mind whatever I have said to you."

Thus life in the divine world is intelligible life. The Son is the principle of life, and the Holy Spirit is the principle of intellectual knowledge. Therefore, as John's Prologue says, the Logos is life and light which illuminates every man born into the world. The Logos is dyadic, the manifested one. Christ in the flesh, and the hidden one, the Holy Spirit. And the Father whose Be-ing is unknowable in itself, is manifested in Christ who said: "Philip, he who sees me sees also the Father. How canst thou say, 'Show us the Father?' Dost thou not believe that I am in the Father and the Father in me?"<sup>17</sup>

I have given rather fully these scriptural quotations most used by Victorinus, to show that he was able to draw from Scripture an understanding of the triune God as *esse-vivere-intelligere*, not in descending order but as mutually implicated in one another. The theory of implication and predominance dominates Victorinus' theological synthesis.

### III

How then can one say that Victorinus' understanding of the Trinity was a Neoplatonic one?

One can say this perhaps in the sense that the Neoplatonic philosophy of the *Anonymous Commentary on the Parmenides* and of the *Commentary on the Chaldaean Oracles* enabled Victorinus to recognize that the processive reality of the Trinitarian God was not contradictory to reason. P. Hadot has documented<sup>18</sup> the Porphyrian materials which he thinks Victorinus used to defend the consubstantiality of Father, Son, and Spirit, but he includes the *Anonymous Commentary on the Parmenides* among the Porphyrian works. Whether Hadot has sufficient evidence from the extant writings of Porphyry to declare that Victorinus depends on him for his Neoplatonism is a weighty question. Are we certain that Porphyry authored the *Anonymous Commentary*? I believe that Dominic O'Meara seems justified in calling attention to the "... character of the available evidence [as to what Porphyry really taught] insofar as this implies interpretative limitations."<sup>19</sup> I believe that we should try to learn far more than we now know about Victorinus' knowledge of the Eastern theologians who discussed the *homoousios*. More attention might be paid to Marcellus of Ancyra who interpreted *homoousion* in the sense of identity and whose dynamic conception of God as the living, active, energetic biblical God is quite like Victorinus' notion of God. Marcellus speaks of God as never without his Word which was in him as *dynamis* and which emerged for God's work of creation and revelation as *energeia*. This monad God expands not in essence so that we can speak of three *ousias*, or three hypostases or three persons, but in activity alone. While it is true that Marcellus' theology is constructed in opposition to Origen's subordinationism, the suspicion of Marcellus' Sabellianism dominated the Eastern church's opposition to *homoousion*.<sup>20</sup>

Nevertheless, from Victorinus' own writings we do know that he believed that the Unitarians of the day (Neo-Arians) and the upholders of "similarity in

substance" (followers of Basil of Ancyra), had made philosophical mistakes. Therefore, in addition to recourse to Scripture for understanding the Trinity, Victorinus felt obliged to argue philosophically. To do this, he had choices to make. Which philosophy available to the fourth-century theologians was best adapted to convey the possibility of a triune God, each of the three distinct from one another, but all three equally God? If one began with the data from Revelation, then the main teaching of Plotinus on the subordination of the two later hypostases could not be used. Yet Plotinus had discovered in the soul's structure an image of the structure of the intelligible world, and he had recognized the mutual implication of *esse, vivere, intelligere*.<sup>21</sup> Moreover, Plotinus had spoken of the soul and its activity as consubstantial. From his scriptural reading Victorinus thought he had to reject what Arius agreed with: that where there is emanation, there must be inferiority. The Nicene Creed had specified that neither inferiority nor posteriority was expressed by consubstantiality. At the dawn of Western theology it seems to have been Victorinus' task to show philosophically how this was possible. In Scripture he had learned that all that the Son has is received from the Father; he was also familiar with the texts that emphasized the infinite *esse* of God. By not accepting the Plotinian principle, "No one gives what he has," Victorinus kept the Son and the Spirit equal to the Father in being, while distinguished from him and from each other by the activity which predominated in each. In feeling free to call God *Esse*, a reality found in all things, he was able also to find in his system a place for positive philosophical theology. There was at hand, moreover, in the fourth century a philosophy which referred to the First Principle of all as Being. This was the philosophy present in the *Anonymous Commentary on the Parmenides* (attributed by Hadot to Porphyry) where we read:

See then if Plato has not also the air of someone who allows us to seize a hidden teaching: for the One, who is beyond Substance and Being, is neither Being nor substance nor act but rather, it acts and is itself pure act, so that it is itself "To Be," that which is before Being. By participating in this "To Be" the second one receives from this "To Be" a derived being: such is "to participate in Being."<sup>22</sup>

The "commentator" goes on to speak of the derivatives from the One-Being. The prepositions used of the Son and the Spirit in Scripture also indicated that the second and third Persons were definable by reduction to the One. The *ek* or *ex* could refer to begetting; the Spirit being sent *ab* the Father and the Son refers to the Spirit's presence in the First or the One; and *in* the Holy Spirit one returns to Father and Son. This metaphysics of prepositions expresses the Western emphasis on the unity of God. The mutual implication of *esse, vivere, intelligere*<sup>23</sup> served Victorinus well in his effort to declare the absolute unity of the Trinity. This had been previously admitted by Plotinus<sup>24</sup> and was to be acknowledged by Augustine also.<sup>25</sup>

Thus Victorinus did not distort Christian teachings by importing Neoplatonic fragments into his exposition of the Trinity. He experienced a profound harmony between Neoplatonism and Christianity. He detected a structural relationship between Neoplatonic philosophy as he conceived it and the Trinitarian doctrine of

the Church as derived from the scriptural use of common names for Father, Son, and Spirit as well as proper names. For in both fourth-century Neoplatonism and Christianity there is admitted the preexistence of the *Nous* or of the Logos in the bosom of the First Principle; Porphyrian Neoplatonism as rehabilitated by Hadot asserts a consubstantiality between God and the intelligible world which emanates from him.<sup>26</sup>

#### IV

One should not, of course, discuss Victorinus' use of Neoplatonism apart from the questions he faced. It is important to realize that he wrote his treatises in response to Arianism in general, to Neo-Arianism in particular, and to those who objected to the use of the word "consubstantial" in the Nicene Creed, namely, the followers of Basil of Ancyra.

In responding to the Arians who took the word "unbegotten" as the distinguishing feature of the Father, the word "begotten" as that of the Son, Victorinus used the Plotinian notion of God as *causa sui*,<sup>27</sup> self-begetting.

To the Neo-Arians who said that the Son was created and not generated inasmuch as generation would imply a mutation in God, Victorinus argued that the correct Neoplatonic understanding of the divine generation is such that it is understood to provide no modification in the generator.<sup>28</sup>

To the theologians united against consubstantiality, Victorinus speaks in Aristotelian language. Consubstantial as used in the Creed denotes that there is only one numerical individual substance of God, and this substance is simple. Therefore, Basil of Ancyra is philosophically in error in speaking of the Son as similar in substance to the Father. Similarity occurs by way of qualities; in God all is substantial.<sup>29</sup>

As is to be expected, Victorinus forsakes his Neoplatonism when he tries to prove to the Latin Homeans that the terms "*ousia*" and "*homousion*" are conformed to scriptural and ecclesiastical language. But in *Adversus Arium* I, when he uses scriptural authority for the consubstantiality and distinctness of individuals within the Godhead by way of common and proper names, substantial and personal names (Spirit, Logos, *Nous*, Wisdom, Substance),<sup>30</sup> he does not hesitate to use the philosophical theory of predominance.

Moreover, the concept of *agere* which functioned both in the *Anonymous Commentary* and in Porphyry's *Commentary on the Chaldaean Oracles* was used centrally by Victorinus to safeguard the Christian revelation of the Son's equality with the Father. "For God is power and the Logos is action, but each is in the other."<sup>31</sup>

By recognizing activity as a transcendental and by admitting that God belongs to the realm of Being, Victorinus was able to speak of God as dynamic *Esse*. The activity of God is to live and to understand. This helped Victorinus to distinguish the essential attributes of God from the personal denominations of the three. He therefore taught that *esse* (*substantia*), *vivere* (*forma*), and *intelligere* (*notio*) are shared by all three. All three are transcendental, predicated of the First Principle.

Hence the Son and Spirit by sharing these essential attributes were in no way inferior to the Father, being also self-begetting.

In the movement of life there is the expression of God by his Son; in the movement of understanding there is conversion to the Father in the Spirit through knowledge and love. The Father's self-revelation is life and wisdom.

In the Trinity the Holy Spirit is the principle of the identity of the three after the Son's dynamic procession. In the world the Father wills the creation and creates through the Son, recreating in the Holy Spirit. Therefore, for us also the Holy Spirit is the principle of identity with God. It is evident throughout this work that Victorinus used the Platonic categories of identity, distinction, repose, and movement to express the procession from the Father and the return to the Father. These divine realities are mutually inclusive, each in all and all in each.

The external activity of God reflects his inner essence as Three Persons:

You give "to be" to all,  
Thou, Son, givest form,  
Thou, Spirit, reform. O Blessed Trinity."

Thus the structure of the act of creation expresses the structure of God.

Whereas Plotinus distributed being and intelligence and life among the two hypostases which follow the One, invoking the principle "No one gives what he has," Victorinus concentrated these in the one triune God. In doing so he allowed for an analogy of dynamic being. All things participate to a certain extent in the attributes of dynamic being. Life is everywhere. "For these three in their progress, as we shall show, have shared with all existents . . . existence, life, understanding, which they give to them according to the proper capacity of things. . . ."

And so, although Victorinus uses abstract vocabulary, his philosophy is concrete and existentialist, a view of being as spontaneous and dynamic. He is impelled to use infinitives to express the dynamism of reality. Energy is the Father, form is the Son; *vivens* and *vita*.

#### V

And if it was proposed that he held the principal activity of the Christian life to be the intellectual one of detaching oneself from sensible knowledge to keep the soul united with the Divine Spirit, the Spirit of wisdom and revelation, yet we should not ignore the fact that he linked the interior movement of divine life with the rhythm of human history.<sup>32</sup> And he respects the value of time, especially as the time for faith. In his *Commentary on the Ephesians* he clearly teaches that salvation is from faith in Christ. And yet, it is undeniable that Victorinus understands faith to be the knowledge of Christ or of the Spirit, ■ uniting knowledge that leads the soul back to its original state of Spirit. But this faith-knowledge is not the soul's own achievement; it is the gift of God. Very dear to Victorinus is the theme of Christ as the true light. The soul is the light (this he learned from Neoplatonism), but not the "true light" (this he learned from Scripture).<sup>33</sup>

With this faith in Christ and in the mystery of his salvific concern for the

world, there is no doubt of the essential Christianity of Victorinus the man. We can also add that as a theologian, his metaphysical reflection on the scriptural revelation of the triune God was expressed Neoplatonically largely because he found this appropriate to help those who in making philosophical errors had misinterpreted Scripture.

### CONCLUSION

How important are these early and intricate speculations on the internal relations of the Trinity? Has Victorinus' Trinitarian theology any lasting significance?

First of all, his work, along with that of others, witnesses to the birth of dogmatic theology and to the role—the carefully limited role—of philosophy in that birth. His work needs to be more widely known and studied. No forward movement in theology is to be expected without a critical acceptance of what was adequate in the theological tradition and a critical rejection of what was inadequate. If historians of theology pass on the theological tradition, they will assist those who are trying to think theologically today. Theologians who confront the contemporary questions should be informed by the past, though not bound by it in the sense of being prevented from progressing, through reflection upon the experience of the Christian community.

In the early theology of the Trinity we see an effort to reflect upon the Christian texts of the Gospels and the Epistles by a Tertullian and an Origen whose Stoic and Plotinian frameworks prevented them from reaching any adequate formulation of the Trinity. At Nicaea, Athanasius used the word "consubstantial" to say that the three Persons are identical to each other, all three being numerically one God. This was a scriptural insight, not a Hellenic one, and no crusade for dehellenization should induce one to forsake Nicaea. Dogma had to develop as it did if the true interpretation of scriptural revelation was to be rescued from theological misinterpretations. Surely dogma is no substitute for Scripture which appeals to all those who wish to be saved and to experience the full worthwhileness of human existence, but dogma may be a necessity for the critical intelligence of those who wish to be assured of the truth of the Gospels. The dogmatic effort is a work of analysis and interpretation and synthesis, an approach to Scripture as true. The Church has provided dogma because it is the guardian of the truth of Scriptures so that they may do their saving work for individuals who come to them.

Thus Athanasius, after reading the Son's scriptural testimony to his Father and himself, used the word "consubstantial" to indicate that all that is said of the Father is also to be said of the Son, except that the Son is Son and not Father. Therefore, the Son is the same substance as the Father but not the same person.

Admittedly, it is a far better thing to live by the Gospels than merely to know what they are saying, but is the former possible without the latter? Dogmas are explicitations of Scripture; they are statements about what is going on there or being affirmed there; they are its truth dimension, significant for persons whose humanness includes a strong intellectual element.

Whereas Athanasius, in independence of any one philosophical tradition, was defining the dogma of the Trinity by using the word "consubstantial," Victorinus belonged to that second generation of post-Nicene theologians who had to consider whether the word "consubstantial" said too much or too little. He felt it necessary to evaluate the Nicene interpretation of the Trinity. And so he did this within the framework of his own convictions of the relation between the three principles of the intelligible world as he understood them through Neoplatonic philosophy in the fourth century. In evaluating the Nicene dogma, he not only formulated a philosophical defense of the possibility of consubstantiality, but he returned to the Christian texts that declared the identity and distinction of Father, Son, and Spirit.

Thus we perceive here two stages of dogma: its conciliar expression as an interpretation of Scripture, and the philosophical defense of its coherence as expressed in theology, in particular in the Trinitarian theology of Marius Victorinus who utilized the Platonic categories and Neoplatonic metaphysics.

The Nicene Creed, however, was only the first dogmatic statement on the Trinity. With the use of more adequate theological method and more adequate philosophical categories, man's desire to understand more deeply the life of the Trinity and its significance for our Christian lives may lead to dogmatic development. This will happen as theologians continue to appropriate past theology critically, that is, to make explicit any implicit incoherence. In any appropriation of the past which necessarily precedes true development of dogma, the Trinitarian treatises of Marius Victorinus the African should not be ignored. For any advance in Christology, a thorough knowledge of Trinitarian theology is fundamental.

In conclusion we may note that Victorinus' argument with the Neo-Arians of his day was an argument against those who resisted development. If he were alive today, what philosophical categories would he use to come to a better understanding of the Trinity? We do not know, but we can say that he would still argue against those who resist development, yet he would argue even more strongly against those for whom development means nothing less than the denial of dogma.

## 4

# The Neoplatonism of Saint Augustine

JOHN J. O'MEARA

have written a good deal on this topic in books and articles, fairly evenly spread out over the last quarter of a century. They bear witness to the inevitable evolution of my ideas on this subject.

During the period there was sustained interest in this field, a great deal of it generated by H. I. Marrou, P. Courcelle, and P. Henry, who, with others, contributed an Augustinian dimension to the remarkable school of late Hellenistic religion and philosophy at Paris, deriving from F. Cumont and J. Bidez, and more recently associated with the names of, for example, A. J. P. Festugière and Ch. H. Puech. There were, of course, others, both in France and far from its confines, who regarded Paris as the center of their studies in this field. And, naturally, I must allude very discreetly indeed to the reigning generation—to such as J. Pépin and P. Hadot—not to say to the very promising group of younger scholars whose formation has been directly or indirectly affected by what I call the Neoplatonic and Augustinian school of Paris.

A great support in more recent times for this scholarly movement was the existence of the *Études Augustiniennes* maintained by Père G. Folliet and his community in the rue François 1<sup>er</sup> (now in rue de l'Abbaye). Not only have they

continued to publish their *Revue des Études Augustiniennes*, which contains also an exhaustive bibliography of what is published on Augustine and, of course, Augustine and Neoplatonism, but they arranged a famous Augustinian Congress in Paris in 1954 that was dominated by the topic to which we are now addressing ourselves. The intense interest and controversy that appeared in relation to this subject on that occasion may be seen in the pages of the third volume of the proceedings, *Augustinus Magister* (Paris, 1954), which reports the more than lively discussions. I shall never forget the interjection of F. Chatillon: "Quant à Plotin, votre Plotin, eh bien! flûte pour Plotin!"

This vigorous remark was one of the last protestations on one side in an embattled dispute with which you may not all be familiar. In 1888 A. Harnack and G. Boissier had put forward a view, expounded in its heyday by P. Alfarié in his *L'évolution intellectuelle de saint Augustin* (Paris 1918), which in effect said that it was not until long after his "conversion" that Augustine accepted the Christian faith in opposition to Neoplatonism. In the context of the time and in the light, for example, of the career of Synesius, the professing Neoplatonist bishop of Cyrene, such a view is not extravagant. From the time of C. Boyer's counter-attack in 1920, however, this view became gradually untenable—hence F. Chatillon's inelegant remark. Still the majority of scholars by 1954 would have agreed that at the time of his conversion, Augustine's acceptance of Christianity was sincere and that he was also deeply impressed by Neoplatonism. He, with many others, thought (fondly as it proved later) that there could be a synthesis between the Christian faith and Neoplatonic reason since indeed the one God had to be the source for both authority and reason. It would, I think, be true to say that since 1954 we are no longer interested in what is now called the "false" problem of whether Augustine at any particular time was a Christian rather than a Neoplatonist or vice versa. To us he now seems to have been a Christian of his time who held certain views that were abhorrent to Neoplatonism but nevertheless had been much influenced by Neoplatonism in not unimportant ways.

A second problem had in the meantime emerged: which Neoplatonist, Plotinus (204/5–269/70) or Porphyry (232/3–ca. 305) was responsible for this Neoplatonist influence on Augustine? W. Theiler (whose death occurred early in 1977) was breast high for Porphyry; P. Henry for Plotinus. In my own introduction to the *Contra Academicos* I had already made it clear that in my view "both Plotinus and Porphyry are well represented" in that work. To that point, claims for the dominating influence of Plotinus were standard. Since then and, I am happy to say, since my own *Porphyry's Philosophy from the Oracles in Augustine* (Paris 1959), P. Hadot's very long review of it in the *Revue des Études Augustiniennes* (VI, 3, 1960, pp. 205–244) and his own subsequent work, *Porphyre et Victorinus*, and the Entretiens held on Porphyry at the Fondation Hardt in Geneva (1966), Porphyry has gained enormously in his reputation as a philosopher and is allowed an important role, alongside his master Plotinus, in influencing Augustine.

So much by way of a *status quaestionis*. But there are some other preliminary remarks which it may be useful to make.

Recently Edward Booth has drawn attention to the eclectic character of Neoplatonism. It was in fact the most influential of the "eclectic contemplative philosophies, with their triple ultimate beings and their doctrines of salvation (which) were the background of Christian Trinitarianism."<sup>2</sup> The spirit of the Roman world, in which Plotinus and Porphyry lived, may have been responsible for some—though hardly all—of the eclectic character of Neoplatonism. The Roman spirit was profoundly sceptical, embracing only the probable, pragmatic and necessarily, therefore, eclectic. I recall vividly how startled I was when I read the opinion of the great Latinist Ernout that Lucretius was not concerned with how true the physical theory of Democritus was on which he based his system: it seemed to work; that was enough.<sup>3</sup> Now I am not saying that Plotinus' approach to truth is the same as that of Lucretius. But I am saying that the Neoplatonists were eclectic.

So was Augustine who was on this point strikingly Roman. Listen to this tidy example from chapter 28 of the twenty-second book of the *City of God*. The topic is the Christian doctrine of the resurrection of the body which the Neoplatonists refused absolutely to countenance:

The Platonists agree with us that even blessed souls will return to bodies, as Plato says, but will nevertheless not return to any evils, as Porphyry says, and take this also from Varro, that they will return to the same bodies, in which they were formerly, then their whole difficulty about the resurrection of the flesh for eternity will be solved.

It is to be noticed that Augustine is not writing flippantly, although one suspects that if he were challenged on this piece of jig-sawing he would have disengaged himself quickly enough. But a remarkable feature of Augustine's writing is his tendency to use the *ballon d'essai*: "This theory," he writes in his first extant work, "about the Academics I have sometimes, as far as I could, thought probable. If it is false, I do not mind."<sup>4</sup> This inconsequential attitude to doctrine propounded by others or even himself is highlighted even more in his other well known tendency to believe that philosophers propounded one thing to the public but propounded very different and sometimes opposite views to their inner circle: it is the old business of exoteric and esoteric doctrines.

But if Augustine was Roman in his eclectic attitude to the truths of physics and logic, he was also Roman in his passionate attachment to ethics. I have often felt disappointed by his handling of philosophical themes in the earlier part of the *City of God*—though I hasten to add both that the controversial nature of that work offered him some excuse, and he does demonstrate a profound aptitude for philosophical speculation elsewhere—but I have always been impressed by his strong passion for social and moral issues. His praise of the high moral and social qualities of Brutus, Torquatus, Curtius, the Decii, Regulus, Cincinnatus, and others is emphatic and sincere.

*Quidquid recipitur recipitur ad modum recipientis.* The fact that Augustine borrowed from the Neoplatonists what he borrowed from them, and how he used his borrowings, all these reflect his own character and interests. I have written on

this topic fairly comprehensively in, for example, *Recherches Augustiniennes* I (1958, pp. 91–111) and in my *Charter of Christendom* (1961, pp. 62–87) and elsewhere. Very briefly, Augustine accepted the Neoplatonic doctrine of an incorporeal Creator, the immortality of the soul, and the existence of Providence and mediatory salvation. Porphyry appeared to Augustine to espouse something like the Christian Trinity and a rudimentary notion of Grace. Augustine had much to criticize in the precise formulation by the Neoplatonists of their doctrines. His criticisms have been usefully set forth by Edward Booth in the article to which I have already referred.<sup>5</sup>

I should now like to look a little, but, necessarily, very quickly, at the particular points of contact which I judge to be of greatest significance between Augustine on the one hand and Plotinus and Porphyry on the other.

In an article in the *Revue Internationale de Philosophie*'s celebration of a Plotinian centenary in 1970,<sup>6</sup> I stressed what I called the conversion syndrome in Augustine's thought and its inspiration in Plotinus, principally in *Ennead* I. 6 "On Beauty." Here Plotinus truly passes on the mystical spell of Plato's *Symposium* to be taken up again by Augustine in a number of passages of the *Confessions* where, according to Courcelle,<sup>7</sup> Augustine describes his attempts to achieve Plotinian ecstasy. I am convinced that the impression that Augustine received from reading Plotinus I. 6, which made it possible for him to abandon materialism in any explanation of reality, abode with him forever. It was not so much Plotinus' articulation of immaterialist doctrine that affected him, as the profound insight that the emotional, almost mystical concentration on the hypostases afforded him:

The reasoning faculty drew away my thoughts from the power of habit, withdrawing itself from those troops of contradictory phantasms; that so it might find what that light was, whereby it was bedewed, when, without all doubting, it cried out, "That the unchangeable was to be preferred to the changeable;" whence also it knew That Unchangeable, which, unless it had in some way known, it had had no sure ground to prefer it to the changeable. And thus with the flash of one trembling glance it arrived at That Which Is. But I could not fix my gaze thereon; and my infirmity being struck back, I was thrown again on my wonted habits, carrying along with me only a loving memory thereof, and a longing for what I had, as it were, perceived the odour of, but was not yet able to feed on. Yet dwelt there with me ■ remembrance of Thee.<sup>8</sup>

Again in the so-called vision of Ostia, he speaks about touching on eternal wisdom: "Could this (touching) be continued on, and other visions of kind far unlike be withdrawn, and this one ravish, and absorb and wrap up its beholder amid these inward joys, so that life might be for ever like that one moment of understanding which we now sighed after?"<sup>9</sup>

It will be observed that the elevation here described by Augustine uses the emotions if only to dismiss them. The *practical* aspect of the matter is in fact represented by the purification of the senses. This purification was fully propounded by both Plotinus and Porphyry and in due course by Augustine. The approach, then, changing somewhat from the metaphysical to the moral, becomes a theme congenial to Roman moralism, be it in Sallust, Seneca, or Saint Augustine.

The Latin language had (and has) an extraordinary power to seize upon the substance of a complicated consideration and express it pithily, memorably, and emotionally. Greek is more intellectual; but when it comes to expressing the whole of human experience and of the *lucrimae rerum*, Latin speaks grandly for the human heart. Over and over again Augustine sums up the necessity to turn to, to be converted to, the Father and to turn away from the things of this world. One can see this in the argument of a whole work such as the *City of God*: *fecerunt itaque ciuitates duas amores duo, terrenam scilicet amor sui usque ad contemptum Dei, caelestem uero amor Dei usque ad contemptum sui*.<sup>10</sup> Or one can see it in the phrases now hackneyed from too much casual use: *inquietum est cor nostrum, donec requiescat in te: noverim me noverim te, ut amem te et contemnam me*. These phrases are highly rhetorical, but their very jingle is part of their usefulness and appeal to the many. We should not be misled for all that; they enshrine the very core of Plotinus' explanation of the origin of things:

ὄν γὰρ τέλειον τῷ μηδὲν ζητεῖν μηδὲ ἔχειν μηδὲ δεῖσθαι οἷον ὑπερρεστή καὶ τὸ ὑπερπλήρες αὐτοῦ πεποίηκεν ἄλλο. τὸ δὲ γινόμενον εἰς αὐτὸ ἐπιστρέφει καὶ ἐπληρώθη καὶ ἐγένετο πρὸς αὐτὸ βλέπον καὶ νοῦς οὗτος. καὶ ἡ μὲν πρὸς ἐκεῖνο στάσις αὐτοῦ τὸ ὄν ἐποίησεν.<sup>11</sup>

Augustine did not quite follow Plotinus in the explanation of the creation of the *Nous*, the first being, by the One, but he did preserve the general structure and vocabulary. In particular the term *conversio*, "turning to," was for him an emotional touchstone of deep and lasting importance. The *Confessions* is the story of his own and of everyman's conversion to God. The *City of God* is the same theme writ large in terms of all angels and humanity that ever was or will be. The intellectual inspiration is in Plotinus.

I have been alluding to the salvational element that Augustine—and others—have discerned in Plotinus. But the other Neoplatonist who influenced Augustine (as we know from Augustine's own testimony), Porphyry, is much more explicit on the theme of salvation—which may well afford some explanation as to why we have until recently tended to rate Porphyry rather less than did Augustine, and why Augustine gives more prominence to him than to Plotinus.

Porphyry was for Augustine not only the greatest of recent philosophers but was one who, although he had abandoned or at least rejected and finally attacked Christianity most forcefully, had also examined its claims and, in his view, came very close to it. Porphyry, Augustine says in the *City of God*,<sup>12</sup> had accepted the God of the Hebrews and had extolled the virtues of Christ—as a man, only, however. Pride and the demons had prevented him not only from accepting the divinity of the Christ who had become incarnate and had died on a cross, but also from appreciating the virtues of Christians and the enduring mission of the Church. But Porphyry's salvationism and eclecticism seemed especially useful to Augustine. Augustine refers to him as follows:

When Porphyry says that no one system of thought has yet embraced a doctrine that embodies a universal path to the liberation of the soul, no, neither the truest of

philosophies, nor the moral ideas and practices of the Indians, nor the initiation of the Chaldaeans, nor any other way of life, and adds that this same path has not yet been brought to his attention in the course of his research into history, he is undoubtedly acknowledging that some such path exists though it had not yet come to his attention. So dissatisfied was he with the results of his devoted study of the liberation of the soul and with what his reputation, higher in the eyes of others than in his own, credited him with discovering and maintaining.<sup>13</sup>

It was the nearness of Porphyry's approach—despite his ultimate fierce hostility—to Christianity that induced Augustine to give more extensive notice to Porphyry than to Plotinus and to praise him more. We must recognize this dominating fact in our assessment of Augustine's own admission of Neoplatonist influence on him.

The influences of Plotinus and Porphyry on Augustine as indicated so far could be described as important indeed but, especially, *dramatic*. At any rate Augustine's description of them is dramatic and, certainly in relation to the influence of Porphyry, also rather politic. There was a doctrinal influence involved, but it tends to attract our notice less. Nevertheless, the influence of both Plotinus and Porphyry at the doctrinal level, even if ultimately rejected, was wider and deeper than has so far been suggested here. Some of this may have been imbibed directly from a reading of these authors probably for the most part in translation. Some may have come to Augustine orally through his Christian-Neoplatonist friends and acquaintances in Milan. At any rate we now know, thanks to the fruitful labors of Berthold Altaner, "quite an amount on the influence of the Greek Neoplatonist Fathers—Basil, the Gregories, Irenaeus, Athanasius, and Origen—on Augustine, manifesting itself at all stages of his life.

I shall end with some comments on the work of Augustine perhaps best known under the title *Hexameron* in the earlier medieval period, and, under the title *de Genesi ad litteram*, very little known in more recent centuries. Only one translation of this work into a modern language, French, has been available and that only since 1972.<sup>14</sup> An English translation by John Taylor (of Seattle) should appear fairly soon. This work, Augustine's fourth attempt to comment (as literally as possible) on the first chapters of Genesis, was finished when its author was about sixty-one years of age. It is, therefore, a rather late and mature work and testifies to the permanent influence of Neoplatonism on his thoughts.

I am discussing elsewhere<sup>15</sup> the extent to which Augustine in the *de Genesi ad litteram* depends upon, for example, Plotinus' doctrine on the λόγος for his fundamental and very philosophical understanding of creation as described in Genesis. Likewise I hope to treat at some future time his use in the *de Genesi ad litteram* of Porphyry's idea of *spiritus* for his equally fundamental and equally philosophical understanding of the afterlife. There are other points of influence, such as that of Plotinus' ideas on Providence or Porphyry's angelology (and this was most significant). Here, however, let me mention briefly one instance only of the influence of Plotinus and Porphyry, taking them—as for the most part, perhaps they should be—together, as seen in the *de Genesi ad litteram*.

Fundamental to the Neoplatonist system and elaborated with great emphasis

in Plotinus is the doctrine that the Father, the One, is beyond being and beyond not only all sensible but also all rational or even intellectual perception:

(13) Thus the One is in truth beyond all statement: any affirmation is of a thing; but "all-transcending, resting above even the most august divine Mind"—this is the only true description, since it does not make it a thing among things, nor name it where no name could identify it: we can but try to indicate, in our own feeble way, something concerning it. . . . The Transcendent, thus, neither knows itself nor is known in itself. (14) . . . We have neither knowledge nor intellection of it (οὐδὲ γινώσκον οὐδὲ νόησκον ἔχομεν αὐτοῦ). . . . we can and do state what it is not, while we are silent as to what it is (καὶ γὰρ λέγομεν, ὃ μὴ ἔστιν· ὃ δὲ ἔστιν, οὐ λέγομεν).<sup>17</sup>

Porphyry and his translator, Victorinus, may well have been agents through whom the idea of the unknowability of the One was transmitted to Augustine. In his *Sententiae* he writes: θεωρεῖται δὲ ἀνοησίᾳ κρείττον νοήσεως.<sup>18</sup>

At any rate Augustine even in the early *de ordine* speaks of God as "known better in not being known": *qui scitur melius nesciendo*.<sup>19</sup> In the *de Genesi ad litteram* he has a remarkable passage stressing how God is not any *thing* but that he is nearer to us, nevertheless, than the many things he made:

Although, I say, it is not possible to say anything of that substance (i.e., God) and there is no way whatever of one man saying anything about it to another except by commandeering some words related to times and places—whereas he is before all times and before all places—nevertheless he is nearer to us, he who made us, than the many things which were made. For in him we live and move and are. . . . It is a greater labor to find them than him, by whom they were made. To become aware of him with a faithful mind from anything, however insignificant, is better in its incomparable blessedness than to comprehend the whole universe of things.<sup>20</sup>

Augustine's use of the *theologia negativa* is, thus, influenced by the Plotinian "Father" or One, whether directly or through Porphyry, or through the Greek Fathers such as Gregory Nazianzen, orally or through writing. The extent to which Augustine's works are heavily marked by this negative theology has been much obscured by what one might call historical institutional theology in the West. This has tended to play down the influence of Platonism in, for example, Aquinas and even more in Augustine, where its presence is more obvious.

From the few instances of Neoplatonic influence on Augustine that I have given you, you will observe that the topic is by no means a simple one. Nor is there any reason why it should be. Neoplatonism, to begin with, was not one, unaltering doctrine, even in Plotinus. After Plotinus it evolved in various ways and, some would say, in curious directions. But above all, the recipient of the influence, Augustine, was a complicated character. Augustine for most of his life as a writer was a Christian bishop deeply committed in literally a sequence of critical controversies, the heat of which was undoubtedly raised significantly by his own ardent temperament. Over and over again, and notably in the *City of God*, he turns aside from a full discussion of some profound problem in order to maintain his general and well-directed polemic. Indeed one can say that the less polemical he is, the more philosophical. It could hardly have been otherwise.

Augustine at the same time was something of an artist and a religious genius. Some have spoken of the warring passions that rent his body. His mind, too, was racked by apparently conflicting loyalties, especially the drive to commend God's claim on us, which appeared to be *absolute*, and at the same time to sympathize with the erring needs of the human heart. In fact he was loyal to both—can be quoted to support both sides—and so can appear to contradict himself.

There is something of that enduring split within him in regard to Neoplatonism too. To the extent—which was in this case quite absolute—that he accepted the incarnation and the resurrection of Christ's and the human body, to that extent he rejected the immaterialism of the Neoplatonists—an absolutely fundamental point. In general, then, I regard Gilson's judgment that Augustine inhibited Neoplatonic influence in the West rather than transmitted it as true.

And yet the traditional practical asceticism of the West, which manifested itself in an actual hostility to the body, however that body is honored in the resurrection of the person, is deeply marked with Platonic dualism. Similarly Augustine sought the rational understanding of the problems and mysteries of Christian theology, perhaps progressively so as time went on, in Neoplatonic sources. Even in the last book of the *City of God*, while opting for the view that in the afterlife our corporeal eyes will see God, he does not omit to give a Neoplatonic view which centers on assimilation of mind with God rather than vision of any kind, however glorified, of corporeal eyes.<sup>21</sup> The matter was not made easier by the knowledge that even Neoplatonic immaterialism was by some understood in a sense involving some kind of matter, however attenuated.

There is no simple statement adequate to describe Augustine's use of the Neoplatonists. I hope, nevertheless, that I have succeeded in conveying to you in some plausible manner how manifold that use might have been.

*Some Later  
Neoplatonic Views  
on Divine Creation  
and the Eternity of  
the World*

GÉRARD VERBEKE

The Aristotelian doctrine of the eternity of the world has been accepted not only by pagan philosophers, but also by Christian thinkers. Synesius of Cyrene, bishop of Ptolemais, one of the five cities of the Libyan Pentapolis, when he was converted to Christianity did not reject the eternity of the world.<sup>1</sup> That is no wonder: it is true that Christian theologians generally interpreted Plato's *Timaeus* in the sense of a creation in time, and yet the eternity of the world is not incompatible with the notion of a divine Creator and Providence.

In the Alexandrian school the eternity of the world was generally accepted. The teaching of Ammonius is transmitted to us through Philoponus' commentary on the *Physics*. Unfortunately, we only possess fragments of this commentary on Book VIII. Moreover, Philoponus does not merely echo the teaching of his master; he also introduces some personal views and remarks. Looking at the parts of the commentary which have been preserved, we notice in several passages objections to and criticisms of the doctrine of the eternity of the world. Presumably, these criticisms don't spring from Ammonius, a former pupil of Proclus in Athens, but are the views of Philoponus himself. Moreover, Philoponus refers to

his commentary on *Physics* VIII where he presented a critical investigation of the Aristotelian doctrine. In the Alexandrian circle Philoponus seemingly was an exception. Olympiodorus, while he was not a Christian, did not oppose Christianity: apparently he thought of Christian religion as a faith for uneducated people. Themistius, when he was prefect of Byzantium, had already adopted a similar attitude: instead of fighting against the Christians, he endeavored rather to show the pagan way of life to be superior to Christianity. No wonder that Olympiodorus remains faithful to the Aristotelian teaching on the eternity of the world.<sup>2</sup> It is more amazing that a Christian teacher like Elias, and probably also David and Stephen of Alexandria, professed the same doctrine.<sup>3</sup> With respect to the Athenian school, Proclus undoubtedly maintained the eternity of the world: it is against him that Philoponus in 529 wrote his famous treatise *De aeternitate mundi contra Proclum*.<sup>4</sup> Presumably, the successors of Proclus, Isidorus, and Damascius, adopted the same position.<sup>5</sup> In any case, Simplicius showed the utmost opposition to the views of Philoponus. During the second half of the thirteenth century, at the time of the Averroistic controversy, the question of the eternity of the world was again violently discussed: the main issue at that time was whether from a philosophical viewpoint we should not adhere to the Aristotelian view, although contrary to Christian belief.

Thanks to the information supplied by Damascius in his *Vita Isidori*, we know that Ammonius had been compelled to make an agreement with the bishop of Alexandria, so that Christian pupils might attend his lectures and that he could get the necessary subventions for the working of the school. This agreement probably was contracted with the patriarch Athanasius II and dates back to 489–496.<sup>6</sup> Damascius violently reproves the attitude of his Alexandrian colleague.<sup>7</sup> Unfortunately, we lack precise information concerning the concessions made by Ammonius: did he recant some doctrines, for example, the eternity and the divinity of the world? Did he allow himself to be baptized? We do not know.<sup>8</sup> It is not impossible, for example, that Ammonius deliberately entrusted Philoponus with the edition of his lectures in order to appease the fears and suspicions of the Christian community. Regardless, we learn from Simplicius that Ammonius wrote a work in which many arguments are put forward showing that Aristotle considered God to be the creative cause of the universe, not only its final cause.<sup>9</sup> Surely that was an important step towards a rapprochement between Aristotelianism and Christianity.

The teaching of Olympiodorus diverges on many important topics from Christian doctrine; for example, he accepts that suicide may be justified in some circumstances and dismisses the Christian belief in an everlasting punishment. He admits only one single God, the first cause of the universe; the other divinities are intermediary beings between God and the world; they may even be considered to be attributes or functions of God. In this respect Olympiodorus comes rather close to Christian belief.<sup>10</sup>

Let us now examine the teaching of Philoponus and Simplicius on the two questions already mentioned, firstly that of the eternity of the world. According to H. D. Saffrey, Philoponus arrived at the school of Ammonius circa 510; he was

already a Christian and about 20 years of age.<sup>11</sup> His commentary on the *Physics* dates back to 517. Although the text of Book VIII is only partly preserved, there are, in the course of his exposition, unequivocal indications of the author's opposition to the eternity of the world.<sup>12</sup> Philoponus wonders what we should think of the sentence saying that nothing could derive from nothing (*nihil ex nihilo*).<sup>13</sup> Quite obviously, being in the absolute sense could not spring from being, because it already would exist before coming to be. Could it proceed from nonbeing? Apparently not, for being, before coming to be, must be able to become; so it derives from something preexistent, a material principle; consequently, it does not proceed from nonbeing.<sup>14</sup> Philoponus replies that this argument is valid only if matter actually subsists before being is produced. He acknowledges however that whatever comes to be, originates from something existent in the sense of an efficient cause, for what comes to be need not necessarily proceed from something in the sense of a material principle. The Creator is able to cause not only the form, but also the matter; hence, it is possible that being stems from nonbeing and that matter is made jointly with the form by a creative cause.<sup>15</sup> Philoponus comes here to the heart of the problem: Aristotle states that every movement presupposes another one and we have to agree with him insofar as finite causality is concerned. The question however arises whether there is not another mode of causation, one that does not presuppose a preexistent matter, but causes the concrete being in whatever it involves. In this case, being in a way proceeds from nonbeing, because it does not presuppose a material principle out of which it has been effected; but on the other hand it springs from being, for it could only come to be by the activity of a creative cause.<sup>16</sup> Is this causation a real movement? By no means, for there is no material principle securing the continuity of the becoming.<sup>17</sup> In this context, Philoponus states that in Aristotle's view the forms of the beings do not derive from any merging of elements; the soul is not the mere result of a combination of elements. Consequently, the forms can proceed only from nonbeing, and the same holds with respect to matter: matter also must stem from nonbeing. In our author's view there is not only a coming-to-be that occurs through a process of generation from preexistent matter, but also the full and total causation of a being from nothing.<sup>18</sup>

In his commentary on Book III of the *Physics* Philoponus states that neither the world nor time exists from eternity and he expounds several arguments to support his viewpoint. If the world had always existed, it would include an infinite number of men having lived already: this is not in keeping with the teaching of Aristotle, who repudiates any infinite in act. Moreover, it would entail the possibility of traversing the infinite in act, for if it can be brought into being, it may be traversed. Besides, something would be greater than the infinite: children being born every day are added to the infinite multitude of men who already existed. Hence the infinite in act might increase indefinitely. Moreover, if every generation counts an infinite multitude of ancestors, the infinite will be produced an infinite number of times. In Philoponus' view all these consequences are absurd and could not be avoided, for it makes no sense to contend that in the case under consideration the infinite extends in one direction only because the present instant consti-

tutes a borderline. The author replies that this specification is not applicable to numbers and not even to continuous quantity.<sup>19</sup> Could we say that in Aristotle's view the infinite could not be brought into being at once, but could be produced progressively? Philoponus answers that Aristotle purely and simply dismisses the infinite in act. It would even be more acceptable that there is an infinite multitude of men at the present instant, than to admit it with regard to the past; for if one accepts it regarding the past, one has to admit that this infinite number may be traversed, that it constantly increases and that the infinite is brought into being an infinite number of times.<sup>20</sup> It clearly follows from these passages and from the references to Book VIII of the commentary that Philoponus, when he edited the lectures of Ammonius on Aristotle's *Physics*, firmly repudiated the eternity of the world and attributed to God a creative activity capable of originating things without preexistent matter.<sup>21</sup>

In Book VI of the *Contra Aristotelem* which belongs to a later period, Philoponus deals with the same problems. Although the work is lost, it is possible to get some idea of its content thanks to the information provided by Simplicius in his commentary on the *Physics*.<sup>22</sup> One of the major objections of Philoponus to the eternity of the world is related to the Aristotelian definition of movement, which is declared to be incompatible with the doctrine in question. Movement is the act of what is movable in potency: the definition clearly implies that the movable in potency exists prior to the movement. Consequently, movement could not exist from eternity, if the movable in potency is always anterior to the movement. As a result, the definition of movement elaborated by Aristotle is not universal.<sup>23</sup> Philoponus however does not agree with Aristotle on that issue: he clearly understood that Aristotle proved the eternity of the world starting from the fact that any movement presupposes already the existence of what is movable in potency. In his view, however, this is not always true: some perishable beings move from the very beginning of their existence: there is the example of fire that, as soon as it exists, moves upwards.<sup>24</sup> Formulating this criticism, Philoponus attacks the very core of the Aristotelian argument: according to the Stagirite, a first movement has to be excluded because any movement implies the preexistence of a movable in potency.<sup>25</sup> Philoponus also contends that all present movements become unintelligible if the world already exists from eternity. For then every movement presupposes an infinite number of previous movements: if we want to explain a particular movement, we have to go back indefinitely in the series of antecedent factors; we could not avoid a *regressus in infinitum*, which means the denial of any explanation.<sup>26</sup> Moreover, all present movements are added to those of the past; that leads to the evidently absurd notion of an infinite constantly increasing.<sup>27</sup> What about the movements of the heavenly bodies? Philoponus points to the fact that the circular movements of some heavenly bodies are more frequent than those of others; the orbits of Jupiter, for example, are three times as frequent as those of Cronos, whereas those of the latter are as infinite as the former. So one infinite would be three times as large as another one.<sup>28</sup> Considering that the doctrine of the eternity of the world leads to absurd conclusions, Philoponus contends it ought to be dropped. Hence the world must have begun at some time in the past; it could

not have existed from eternity. The question however remains concerning the future: will movement and time continue indefinitely in the future?<sup>29</sup> The answer must evidently be negative: no finite body could ever possess an infinite power; the argument is used by Aristotle in order to prove that the First Principle has no corporeal size. The power which is contained in the world could only be finite, which implies that the world could not continue to exist indefinitely.<sup>30</sup> Moreover, all beings in the world are compounded of matter and form and whatever is compounded in that way is perishable because matter is not always linked to the same form.<sup>31</sup> All those arguments of Philoponus belong to the field of philosophy; their inspiration is even Aristotelian. The criticism of the Greek master is undertaken from within his own system, without appealing to the authority of other philosophers or to arguments of a religious character. Philoponus endeavors to refute Aristotle through Aristotle himself.

Our author also examines the Aristotelian argument concerning the eternity of time and he comes to the same conviction—that the demonstration is inconclusive. In his view we could not assert that all instants are at the borderline of a past and a future: it would be a *petitio principii*. If time started, the first instant is not at the frontier of a past and a future.<sup>32</sup> Does time always refer to a previous time? If time began, we should ask the question, what was before time? Philoponus replies that in this case the term "before" has to be interpreted in a nontemporal sense because it does not refer to a temporal dimension.<sup>33</sup> Furthermore, the author contends that anterior and posterior do not always involve a temporal dimension. The mind without being in time grasps its objects the one after the other. God also wants things to take place in some successive order, and yet there is no temporal dimension in divine willing.<sup>34</sup> God knows the past and the future: does it follow that divine knowledge bears the stamp of temporality? By no means.<sup>35</sup> According to our author time as well as the world began. He quite disagrees with those who contend that time never started, but that the world had a beginning. In this respect he agrees with Plato whom he believes to be intrinsically coherent: time as well as the world does not exist from eternity, but had a beginning.<sup>36</sup>

Still, a further question has to be taken into consideration: how did the world, movement, and time ever begin to exist? The answer of Philoponus is quite unambiguous: the world began by an act of the divine will, which does not imply anything preexistent and does not involve any temporal dimension. It is not impossible for God to originate something from nothing: it is enough for him to will something to be and it exists, for he not only makes the form, but also the matter. It would be wrong to conceive of the generation of the world in the way of the ancient cosmogonies: the world has not been generated, it is not the result of a process of coming-to-be; it has been produced from nonbeing and in an atemporal way.<sup>37</sup> In order to support and illustrate his viewpoint, Philoponus refers to the works of nature and artistic activity. Prime matter has not been generated by nature and it does not pass away in the way of perishable beings; it has been made from nonbeing. Where do the forms in natural beings and works of art come from? Because they do not preexist in any way, they could only proceed from nonbeing.<sup>38</sup> Consequently, God created the world in an atemporal way by a sheer

act of willing. Does this creation introduce any change in the divine perfection? By no means, because the creative act is atemporal; it is beyond any temporal succession. The divine willing by which the world begins to exist does not introduce into God any temporal extension nor any change because this willing is not inserted in the unsteadiness of temporal succession.<sup>39</sup>

Let us now proceed to the study of Simplicius' reaction to the interpretation of the Alexandrian scholar. One is immediately struck by the violence of tone adopted by the Athenian professor. Is there any personal spite involved? This is hard to believe because Simplicius contends never to have met Philoponus, which is perfectly acceptable if the one worked in Alexandria and the other in Athens. Is it rather a kind of grudge between two schools? That is more likely. Damascius also did not spare Ammonius, and the troubles of the school of Athens from 529 onwards certainly did not contribute to appease the atmosphere. Even if Justinian did not really close the school of Athens, as A. Cameron believes, but tried to prevent pagans from teaching in it, nevertheless this institution had to cope with conditions that were much more difficult than those of the Alexandrian school.<sup>40</sup> Simplicius repeatedly states that the objections of Philoponus are foolish but dangerous because they impress people who have not received a strong philosophical education. In Simplicius' view Philoponus is a traitor who abandons the precious legacy of Greek thought in order to cling to Egyptian mythology. The author makes fun of the narrative of Genesis, of the creation in six days, of a God who created the sun on the fourth day. He is indignant that a representative of the Alexandrian school surrenders to these poor mythological accounts.<sup>41</sup>

With respect to the eternity of movement, Simplicius declares the position of Aristotle to be perfectly coherent.<sup>42</sup> In his view the definition of movement as it is formulated by Aristotle is universal and not incompatible with the eternity of the world. For the movable must always exist prior to the movement, even in the case of eternal movement. Let us take circular movement: it is never given at once, so that each stage of the revolving refers to an anterior stage.<sup>43</sup> What Aristotle intends to show, on the basis of his definition, is the impossibility of a first movement: each movement is inserted in a process without beginning and without end.<sup>44</sup> It is useless also to contend that some beings already move from the very beginning of their existence. Simplicius introduces a distinction between perfect and imperfect potency. If fire moves upwards from its origin, it is because it has a perfect potency to do it; if it had an imperfect potency only, it would be unable to do that. Precisely in the case of an imperfect potency, Aristotle maintains that the movable must exist prior to the movement.<sup>45</sup> On the level of second causes, it is apparently impossible to refute the Aristotelian reasoning; from this viewpoint each movement is connected with a prior movement. The question arises however whether there is no opposition between the eternity of movement and the Aristotelian teaching concerning the infinite in act. According to Simplicius there is no contradiction involved, for in the case of movement or change the infinite in question does not totally exist at once. What in Aristotle's view could never be brought about is an infinite that exists totally at once. Besides, a movement without beginning is not yet infinite at present because it is marked by a boundary; in other

words, it is not infinite in both directions. As a result a movement that occurs now does not simply have an infinite number of antecedents; the fire that burns now is not unintelligible because the event is located at the limit of a series which, though being without beginning, ends at this term.<sup>46</sup> Simplicius stresses the transformations of elements into each other: these changes are comparable to a circular movement without beginning. Things would be different if the number of forms happened to be infinite, but that is not the case. There is a limited number of forms and within this framework the transformations take place. The fact that this cycle is going on from eternity does not present any difficulty as to the explanation of a present event. As a matter of fact, if the number of forms were infinite, then our knowledge would be impossible and generation itself would be excluded.<sup>47</sup>

How then are we to conceive of the temporal dimension? Simplicius believes that on this subject there is a perfect agreement between Plato and Aristotle: the world has been shaped in the image of an eternal pattern, which means that it exists in a temporal dimension without beginning or end.<sup>48</sup> As to the Aristotelian argument saying that each element of time refers to a previous time, it is perfectly consistent: if there were a beginning of time, the question would arise as to what was "before" that beginning and in Simplicius' view the term "before" could only have a temporal meaning.<sup>49</sup> The author also states the Aristotelian conception of the instant to be correct. Is it a *petitio principii*? Not at all, because it is not the same to hold time to exist from eternity and to say that the instant is an intermediary (*μέσσην*).<sup>50</sup>

One of the major criticisms Simplicius makes of the theory of Philoponus refers to divine immutability. The author dismisses any form of change in God. In his view it is inconsistent to believe that God was firstly inactive, then proceeded to the creation of the elements and further entrusted nature with the control of the transformations of the elements and the making of bodies from those elements.<sup>51</sup> Simplicius is convinced that this conception is incompatible with divine immutability. The author does not agree with Philoponus who declares that the anterior and posterior do not always refer to a temporal dimension: if the mind grasps its objects one after another, it could not be indivisible or unextended; the passage from one object to another is not possible without temporal extension.<sup>52</sup> According to Simplicius, the mind does not think the objects of its knowledge by passing from one object to another (*μεταβατικῶς*), but by distinguishing each one from each other.<sup>53</sup> In this respect the author is echoing a Plotinian distinction between the knowing of the mind and that of the soul: the former is a permanent intuition of all the intelligibles, whereas the latter is a discursive knowledge passing constantly from one intelligible object to another. In order to vindicate Aristotle's viewpoint concerning the eternity of the world, Simplicius emphasizes the difference between a process of generation and a creation out of nothing: what is generated proceeds from what already exists and passes away also into what exists;<sup>54</sup> moreover, any change occurs through the action of an external factor. The same holds with respect to decomposition: in Aristotle's view, it is a change occurring in time. By considering the final result only, one could say that decomposition takes place instantaneously.<sup>55</sup> If one draws attention only to the process of generation and

passing away, one could not but accept that process to be without beginning or end. The creative activity of God is an integral causation that does not start from a preexistent matter: God makes things in an atemporal way (*ἀχρόνως*), hence he originates them always.<sup>56</sup> What is made by the Creator out of nothing does not come to be by generation; so the author concludes that it possesses an eternal substance.<sup>57</sup> According to him Aristotle asserts that what immediately springs from God (*ἀμέσως*) is eternal. If God made matter, he created it from eternity. The same holds with respect to the forms common to all corporeal things: stemming directly from God they must exist from eternity and will never pass away.<sup>58</sup> As to the objection that no finite body could possess an infinite power, the author makes a distinction between the power of moving and the power of being moved. The power of moving eternally could not simultaneously exist in a finite body, whereas it is not impossible that the power of being moved eternally exists in a limited body.<sup>59</sup>

It is noticeable that the disagreement between Philoponus and Simplicius does not concern the concept of creation as an integral causation: both authors accept that God makes beings out of nothing. Philoponus however declares that the world could not exist from eternity and that it came into existence by a creative act which is beyond movement and time; in his view this act is not incompatible with the divine immutability. Simplicius, on the contrary, teaches that the process of coming-to-be and passing away occurring in the world could never have started because it always refers to a previous movement. In his view it is not possible that God ever caused this becoming to start through a creative act: appealing to a Neoplatonic argument, the author asserts that whatever springs from God directly must be eternal. It is quite true that according to the Stagirite the first heaven is what is moved immediately by the Unmoved Mover; through the regularity and eternity of its movement it expresses the perfection of the moving principle. It would however be wrong to state that Aristotle's theory concerning the eternity of the world was based on the nature of creative causation. The concept of an integral causation was foreign to the mind of the Greek master.

The commentary of Simplicius on Aristotle's *Physics* is particularly interesting thanks to the rich information it provides concerning the doctrines of previous philosophers. His interpretation shows a great erudition, but it is not always faithful to the authentic thought of Aristotle. The first cause of Aristotle is not that of Simplicius and this is not the only case in which Simplicius gave to Aristotelian thought a turn that does not correspond to its original content. A similar distortion may be found in the interpretation of the intricate question of chance and fortune. It is more difficult to formulate a judgment about the commentary of Philoponus: to what extent does it reflect the teaching of Ammonius? In any case, the interpretation is very penetrating, especially in those passages where the author criticizes the doctrine of Aristotle and expresses manifestly his own ideas. Alfarabi takes Philoponus to task for settling a philosophical question with the help of religious doctrines:<sup>60</sup> nothing is less true, as W. Wieland has already noticed. Philoponus, rather, uses Aristotelian philosophy in order to refute Aristotle.<sup>61</sup> On the other hand he appeals to the concept of creation against the

eternity of the world: he very sharply notices, perhaps also under the influence of Ammonius, that creation as an integral causation is not a movement and does not belong to the continuous process of coming-to-be and passing away. Thanks mainly to the concept of creation, the author escapes from the eternity of movement and time.

# John Philoponus and Stephanus of Alexandria: Two Neoplatonic Christian Commentators on Aristotle?

HENRY BLUMENTHAL

"Two Neoplatonic Christian commentators on Aristotle?" The query is crucial, and could equally well come at three points in the title of this paper. It could come after the word "two" because it is not yet clear how much difference there, in fact, is between the commentaries of Philoponus and Stephanus on Book 3 of Aristotle's *de Anima*—it is these two commentaries with which I shall be primarily concerned. We now have Stephanus of Alexandria's exposition of this book in the transmitted text of Philoponus' commentary, while Philoponus' own survives only in a thirteenth-century Latin version by William of Moerbeke, and only for chapters 4–8 at that; it is also to some extent reflected in the paraphrase commentary by Sophonias,<sup>1</sup> which should probably be dated to the fourteenth century. So that is one question. One could also place the query after "Christian." Their philosophical background is manifestly Neoplatonic, but were they both, or was only Stephanus, Christian at the time when they wrote their commentaries—or gave the lectures on which the commentaries as we have them are based?<sup>2</sup> Yet again one could put it after "commentators." Were they Christians whose exposition of Aristotle *thereby* differed from what it would have been had they been pagans, or

commentators on Aristotle who were no more than incidentally Christian? In other words, do the Christian convictions that both may have had bear in any way on their reading of Aristotle? And if they do, how can we detect the operation of this bias? Finally, we might ask how much these men were genuinely commentators on Aristotle at all.

Let us deal first with what should, at first sight, be the easiest of these questions: one commentator, or two? On a superficial level three sets of differences immediately present themselves. First, a crude measure, but informative nevertheless, is the scale of the commentaries. In the one Neoplatonic commentary which survives intact, that of Simplicius (?Priscian),<sup>3</sup> the commentary on Book 3 is twice as long as that on Book 1, and three-quarters as long again as that on Book 2, whereas in Stephanus' version (or whatever it is), the commentary on Book 3 is only four-fifths as long as Philoponus' on Book 1, and not much longer—some twenty pages—than Philoponus' on Book 2.<sup>4</sup> Now this might be a sign of different interests rather than anything else, but should at least be noted as a possible indication of difference. More significant is that within Book 3 itself, the relative length of discussion in different passages is not always the same. Sometimes Philoponus has more to say on one passage, at others Stephanus will give a long exposition of texts on which Philoponus has very little to say.

Second, we have a difference relating to the organization of the material. Philoponus' commentary continues with no marked breaks or divisions other than those arising from the text on which it is a commentary. Stephanus', on the other hand, falls into that series of divisions into *theōria* and *praxis* which seems to have been codified by Olympiodorus, though it can be traced back to Proclus.<sup>5</sup>

Third, we have a matter of scholarly practice. Stephanus' commentary, but not Philoponus', contains numerous named references to earlier commentators (or philosophers assumed to be commentators—especially Alexander and Plutarch, perhaps the only previous authors of full-scale commentaries on the *de Anima*, or at least Book 3 of it) and a continuous examination and dissection of the views of both these and others. That this apparent difference was not due to excisions by the Latin translator can be seen at once by a comparison with Philoponus on Books 1 and 2, as well as his other commentaries. Only Alexander constitutes an exception, both in the Latin *de Anima* commentary and elsewhere. But it must not be thought that the translator never made changes or additions: in the exposition of 3.4 we have a note on the fact that Greek *morion*, unlike Latin *pars*, was neuter, which cannot have been in the original. Thus we have here a *prima facie* case for distinguishing our two commentators as independent authorities—within the limits of independence at this point in the tradition. We have not yet excluded the possibility that they produced different presentations of a similar commentary; the formulation here is deliberately vague since, theoretically at least, straight dependence and common descent are equally possible. But a look at both the structure and the detailed contents of some of the comparable parts of each commentary will show that they are in fact independent.

By way of example let us take the opening discussion of 3.4, where Aristotle turns from imagination to thought, from the irrational to the rational soul. This

latter distinction is one that is not present in Aristotle's treatise—it is mentioned only in passing in a later discussion, and attributed to persons unnamed<sup>6</sup>—but it is of course one of the major concerns of the Neoplatonist commentators, our two as well as Simplicius, who were much preoccupied with allocating the soul's faculties and activities to its higher or lower sections. Thus *phantasia*, working as it does with both, naturally presented peculiar difficulties, which are prominent in the exposition of *de Anima* 3.3.<sup>7</sup> Some of these are also conspicuous in the treatment of 3.4, where they are relevant insofar as it is necessary to establish how far reason and intellect involve imagination.

A brief look at the structure of the two expositions of 3.4 will show that the two commentaries cannot simply be identified. Philoponus, but not Stephanus, gives a short introduction to the discussions that are to follow. Both commentaries then tell us that Aristotle is setting out to answer three questions. Since Aristotle himself does not say this, it is probably part of the commentary tradition.<sup>8</sup> Aristotle himself says that whether or not the part of the soul by which it knows and thinks is separable—thus indicating that he does not himself intend to deal with that question in this place—we must ask how this part of soul differs from others, and how thinking takes place. Thus Aristotle asks *two* questions: the commentators, with their own special concerns clearly influencing their reading of Aristotle, have him ask three. According to Philoponus these are:

1. Is the rational soul separate or inseparable?
2. How does it differ from the sensible (*a sensu*)?
3. How does intellection happen in us?<sup>9</sup>

Stephanus' list is not, however, the same. The three questions he gives are:

1. Is the soul destructible or not?
2. How is the rational soul different from the sensible?
3. How does intellection take place?<sup>10</sup>

In these lists only the second and third questions more or less coincide. The first in Stephanus' list could be an implication of the one given by Philoponus, which is closer to what Aristotle actually says. The second and third, as we have said, do go back to Aristotle himself, but in the first the commentators have taken the words in which Aristotle puts aside the question of separability, as he repeatedly does, and turned them into a third question which not only reflects their own interests, but which is clearly more important to them than the other two. These however are Neoplatonic—or perhaps just simply Platonic—interests, and not Christian ones, though they do of course relate to Christian problems. The answers given are in any case firmly in the Platonic tradition.

A curious mixture of Neoplatonic aims and Aristotelian content emerges from Stephanus' *theōria*, the preliminary general discussion of matters under investigation in this section.<sup>11</sup> Stephanus announces that he will deal with the first two of the three questions, and start with the second because the second helps towards an answer to the first. Proceeding thus, he distinguishes rational soul from sensation—let us remember that the distinction of a rational soul from an irrational one does

not figure in Aristotle's discussion—and argues that, though they have certain features in common, they differ in their reaction to intense stimuli. While this point is of course raised by Aristotle himself later in the treatise,<sup>12</sup> he does not draw the conclusion that is produced by Stephanus, namely that the very fact that *nous* thrives on intenser stimuli, and is helped by them to deal with the lesser ones, is a strong indication of its eternity. Neither this arrangement of the arguments nor the argument itself is to be found in Philoponus' discussion of this chapter. Nor is the second argument: that since *nous* can and does think all things, it must be incorporeal and eternal. The preoccupations that emerge from these discussions (preoccupations with discerning the differences between the levels of soul, and with the question of immortality) are of course highly relevant to our last question, how much these works are in fact commentaries on Aristotle. The answer suggested by this section is that they are rather meditations arising from the text of Aristotle, and that is an answer that can easily be reinforced by other evidence. The most conspicuous is the Neoplatonizing treatment of the next chapter, 3.5, which introduces into the exposition of Aristotle the whole Neoplatonic debate on the status of the individual *nous*.<sup>13</sup> Similarly we have the assumption that Aristotle must be talking in terms of a detachable soul on the Platonic model, patently wrong but consistently maintained by all the Neoplatonic commentators, in spite of some attempts by Philoponus to understand Aristotle in his own terms.<sup>14</sup> Thus the whole discussion of 3.4 is based on a consequence of the Platonic model, namely that the soul uses the body as a tool or instrument.

In the sequel the two discussions diverge further, and even when the same or similar points are made, the order in which they are introduced is not the same. Philoponus continues<sup>15</sup> by discussing how the intellect might be a part of the soul, and argues that Aristotle has used the term improperly. He maintains that in the soul the part must be coterminous with the whole, and this means that either the whole soul would be immortal, or not; whereas Aristotle has previously said that we are dealing with a different section of the soul. Further, the word "soul" is used equivocally, just as, for example, "sun" may mean the body or its light, and "Ajax" may refer either to the son of Telamon or a mysterious Trojan: neither of these examples is to be found in Stephanus. At the equivalent point in his discussion, Stephanus gives us the views of Plutarch and Alexander on the significance of the *lemma*,<sup>16</sup> but does not involve himself in the meaning of "part" until after he has dealt with the meanings of *nous*, which in the Philoponus commentary are discussed immediately after the section on "part."<sup>17</sup>

If we compare the two discussions of the senses of *nous* we find a similar account given by both commentators, though again the presentation differs. Philoponus goes straight on to consider three senses of *nous*,<sup>18</sup> while Stephanus gives us his view of what Aristotle means after telling us that Alexander and Plutarch take them differently. He discusses their treatments in some detail, and also explains Ammonius' differences with them before going on to his own position.<sup>19</sup>

Philoponus, on the other hand, states his own position first and then goes on to discuss certain views of Alexander, which Stephanus mentioned at a correspondingly earlier stage. Here, apart from the difference of presentation, we find that

the two commentators have produced substantially different accounts of Alexander's position. Alexander, as is well known, held that the strictly human intellect was mortal, and that the active intellect was external to the individual. Now, according to Philoponus, Alexander was unable to deny that intellect was such as he has told us Aristotle's intellect was, citing the Aristotelian description of it as pure or unmixed and impassible. Therefore, says Philoponus, because he could not go against these pronouncements, Alexander said that Aristotle was talking about the universal intellect.<sup>20</sup> Stephanus, on the other hand, says that in order to maintain his position, Alexander did just what Philoponus said—rightly—he was unable to do, namely that he attacked the idea that *nous* was pure, impassible, and separate.<sup>21</sup> Here, on a point of considerable importance, they give manifestly conflicting accounts of Alexander, the only authority whom Philoponus cites by name in this part of his commentary.

Here, then, are a few examples, which could be multiplied without difficulty, of the difference in presentation and substance between the two commentators. They should suffice without multiplication to show that we have before us two separate commentaries, and not merely different versions of a typical and traditional Alexandrian lecture course on the *de Anima*. Yet certain similarities of approach are clearly present.

Now that we have established that we are dealing with two separate commentaries, we must turn to the question of their authors' religion. In Stephanus' case the mere fact of his Christianity (suggested by his name, his date, and his occupation of an official chair at Constantinople,<sup>22</sup> as well as the occasional pronouncement)<sup>23</sup> should be accepted<sup>24</sup>—its importance is another matter—but in that of Philoponus there is a problem. Here we must expand the point about being Christian at the time of composition of the *de Anima* commentary, or indeed of any of the Philoponus commentaries.<sup>25</sup>

Until recently, then, it has been commonly thought, lack of evidence from antiquity notwithstanding, that Philoponus had begun his philosophical activities as a pagan and subsequently become a convert to Christianity—to which his name John suggests, but does not prove, allegiance—after he had written his commentaries. This is the view of Gudeman in his generally unsatisfactory *Pauly* article, and has been maintained by others since.<sup>26</sup> In a book difficult of access—it was published in occupied France—R. Vancourt treated Philoponus as if he were a Christian when he wrote the *de Anima* commentary.<sup>27</sup> Subsequently E. Evrard, examining the chronological relationships of Philoponus' *oeuvre*, mainly on the basis of his views on the movement of the heavenly bodies and his understanding of Aristotle's fifth element, has argued that there is no chronological separation between the commentaries and the other works, and in particular that the *de Aeternitate Mundi contra Proclum* was written before the commentary on the *Meteorologica*.<sup>28</sup> That in itself, if correct, as I think it is, is sufficient to destroy the traditional position. It would mean that we cannot be sure that there was in fact any time when he was a pagan. Evrard proceeded to examine briefly the *de Anima* commentary, and to suggest that the apparently non-Christian views in it, on the preexistence of the soul and the immortality of the luminous body, are explicable

in terms of an Origenism which, he thinks, survived at Alexandria. He further suggested, following Vancourt, that Philoponus' explanation of *de Anima* 3.5 was influenced by the wish to select from the field a view not incompatible with Christianity, namely that we have a single soul of which the intellect is part.

To take the second point first. Whether or not Philoponus was a Christian is probably irrelevant; the choice he makes is explicable in terms of the Neoplatonic tradition: three of the four views presented in the commentary are in fact Neoplatonic views, and are connected with Aristotle only insofar as the Neoplatonists thought they and Aristotle were expounding the same philosophy. I have examined this matter in some detail elsewhere, so shall not pursue the point now, but simply say that what Philoponus—and Stephanus—did was to adopt the standard and orthodox Neoplatonic view about the human intellect, namely that it is single and fully descended.<sup>29</sup> Insofar as that is what they did, we cannot attach great significance to their choice. It remains possible that Christian prejudice affected it, but it is unnecessary to introduce it into the discussion of their motives. Ironically, the problems presented by the Platonic view of the soul could be solved by reading Aristotle in the way we think he should be read, which is just what his interpreters in antiquity did not normally do. Thus a more straightforward reading of Aristotle might be a result of Christian bias, and one might consider in this context Aquinas' interpretation of 3.5.<sup>30</sup> As for luminous bodies, these, or pneumatic ones, were characteristic of Platonists and Platonizers alike.<sup>31</sup>

Similar explanations may be offered of Philoponus' view that the world was created in time. Like the dispute about the status of the intellect, this too reflects a long-standing and well-known controversy among Platonists after Plato. The point at issue was, of course, the interpretation of Plato's *Timaeus*. This is another controversy whose details need not concern us here. It need only be recalled that the view that the world was created in time was not a function of Christian readings of Plato, but can be traced back to Plato's immediate pupils—if not to Plato himself—and reappears at intervals thereafter.<sup>32</sup> In this matter too, Christian conceptions are compatible with the view offered and may have influenced its choice but, here again, the internal history of the Platonic tradition offers sufficient explanation of the facts.

Whatever one's assessment of Philoponus' Christianity and its influence on his views about these questions might be, it is clear that it was not otherwise sufficiently pervasive to prevent him from producing Neoplatonic material that is not strictly compatible with Christianity, at least in the course of background outline exposition. Thus, in speaking of the various levels of perfection and knowledge of different faculties of soul, he will say of *nous* that it is more obscure than reason in that its activities rarely penetrate to men, and then only to a few.<sup>33</sup> This seems at first sight to make intellect external. Insofar as it does, it is inconsistent with the understanding of 3.5 manifested by both Philoponus himself and Stephanus, who, as we have mentioned, chooses that Neoplatonic view of human intellect which holds it to be single and internal. Any doubts that might remain about the presence of material ill-suited to Christian ideas may be resolved by a reading of the preface to Philoponus' exegesis of Book 1.

The determination of Philoponus' position does, of course, present unusual difficulties because his views were by no means orthodox. Not only was he a monophysite (that is straightforward enough), but he struck at least one of his contemporaries as having deceived himself by holding views appropriate to the very pagans he ostensibly attacked. This was Cosmas Indicopleustes, the Traveler to India.<sup>34</sup> Cosmas may not have been a man of great philosophical culture or acumen, and he may not have known that Philoponus was a late convert—possibly because he was not—but this view of Philoponus should at least put us on our guard against saying that he was not a Christian at the time he wrote the *de Anima* commentary just because it manifests strange views about man and his nature.

And such views are present. If one were to set out some criteria for establishing whether or not a writer was Christian, one might think of the following: 1) a refusal to accept the soul's preexistence, though that is subject to the difficulty about Origenism already mentioned;<sup>35</sup> or more significantly, 2) disembodied existence after death of the normal Platonist type<sup>36</sup>—Porphyry had singled out reincarnation with a body for a scornful attack in his work *Against the Christians*;<sup>37</sup> and 3) the absence of the belief that the soul is capable of attaining salvation, or union with higher Being, by its own unaided efforts.<sup>38</sup> By these criteria Philoponus fails to qualify. All these views may be found right at the start of his commentary, in the preface. There we have the soul's preexistence<sup>39</sup> (which may not be crucial), survival after death without the body,<sup>40</sup> and several references to soul's assimilation to *nous* by habituation, or the practice of the cathartic virtues,<sup>41</sup> with no word of any help from above. We have already suggested that heresy rather than paganism may, at least in part, be the explanation of all this. If however one is trying to show that he held pagan views in the commentaries, and Christian views elsewhere, one has to show that there is a clear measure of inconsistency between the commentaries and those works which are indisputably part of Philoponus' writings *qua* Christian. Now when one looks at some of his views on the soul in this light, the opposite turns out to be the case. Thus what he has to say in his disquisition on the creation of the world, the *de Opificio Mundi*, about the ensoulment of the embryo turns out to be, shall we say, easily compatible with Neoplatonic views on the subject.<sup>42</sup> In particular, he divides the soul into two, a rational and an irrational part. Animals other than man have an irrational soul inseparably united to the body. Man in addition has a separate part (*chōriston*) which is the rational soul. He makes the distinction in connection with Aristotle's definition of the soul, and he treats that definition in a way that is not difficult to recognize as Neoplatonic, comparable not only with what Philoponus himself says in his commentary on the *de Anima*, but also with the explanation offered by Simplicius, who has never been suspected of Christianity.<sup>43</sup> What he does is to say that part of the soul is an entelechy of the body, as music is an activity of the lyre; while another part is separate like a sailor on a ship (or a charioteer)—an old image going back to the hesitation at *de Anima* 2.1,<sup>44</sup> a passage vigorously exploited by several Neoplatonists.<sup>45</sup> On this basis we should have to treat the *de Opificio Mundi* as a non-Christian work, which it patently is not. Therefore the appearance of the same view in works of uncertain status cannot be taken to show that they are pagan in doctrine, let alone in authorship.

As for vocabulary that might indicate Christian training or ways of thinking, there is virtually none in Philoponus. What there is, a reference to angels and the essence of angels,<sup>46</sup> may be a medieval insertion. That Moerbeke did not always, as is commonly thought, provide a straight literal translation is shown by the discussion, mentioned above, of the fact that the word Aristotle uses for "part" in 429 a 10 is, unlike its Latin equivalent, neuter.<sup>47</sup> If however we compare this situation with that in Stephanus, its significance is diminished. Given that Stephanus was a Christian writer, we might expect a higher incidence of Christian vocabulary. But apart from a very short section<sup>48</sup> to which Professor Westerink has already drawn attention,<sup>49</sup> and which, if it alone survived, would give a very different impression from the whole, there is virtually none in the part of the commentary that covers chapters 1–8, some 124 pages in all. The section that is an exception to this rule and has some Christian terminology actually embedded in the text, has *angeloi* in the Christian rather than the Neoplatonic sense, a reference to *eusebē dogmata* clearly meaning Christian (by now a standard sense,<sup>50</sup> as opposed to Platonic) doctrines, and also one to *theos*, again in the Christian rather than the normal Greek sense. In addition there is an apparently approving reference to Providence (*pronoia*) as a name for God.<sup>51</sup> Possibly one should add here a number of ambiguous references to faculties vouchsafed to us by the demiurge,<sup>52</sup> who could be either the ordinary Platonists' demiurge or the Almighty in Platonic disguise, and the tag "he said and it happened" (*eipe kai egeneto*) which seems to allude to the Genesis account of creation.<sup>53</sup>

With these we should perhaps put the terminology of the section-ending marks. The usual form of these in Stephanus is *en toutois hē theōria sun theōi plēroutai*: "here, with God's help, ends the general discussion" or, *en hois hē praxis sun theōi plēroutai*: "here, with God's help, ends the lecture." For comparison, the pagan Olympiodorus uses slightly different formulae, such as *tauta ekhei hē theōria*: "this is the content of the general discussion," without any mention of divine aid. These appear uniformly in the commentaries on Aristotle's *Meteorologica*, Plato's *Gorgias* and *Phaedo*, and also the *First Alcibiades*. In the commentaries on Platonic and pseudo-Platonic works, however, there are separate section headings for the lectures, of the type *praxis sun theōi*: "lecture, with God's help," followed by a numeral. Now the Olympiodorus commentaries are probably editions by students,<sup>54</sup> and it could well be they—or even later copyists—who put in the non-integral chapter headings. If that is so, and if the chapter-end markings in Stephanus are not also later additions, more skillfully inserted so as to have the appearance of being integral to the text, then we do have at least a superficial mark of Stephanus' beliefs. "Superficial" must be stressed because there are, as we have seen, other explanations of his choices as a commentator. As for Philoponus, one would not expect to find comparable expressions in his text, given the absence of the organization of material to which they belong.

All this indicates, at least by way of sample, that Christianity was, at most, of little importance in the composition of these commentaries and the selection of the views they express. Further exemplification of this point would not be difficult, but space precludes it here.

Instead we must now come to our last question, how much were these men

genuinely commentators on Aristotle. It is a question that is not as difficult as the others, though the obvious answer is misleading. Superficially, the answer must be yes, of course they were. They did after all write, or provide the material for, commentaries in the sense of exegetical works discussing the interpretation of texts. And when we consider primarily philological explanation of what unclear passages of Aristotle mean, then their opinion as interpreters of the text deserves to be respected in a perfectly straightforward way. The difficulty comes at the next level, that of philosophical exposition. And here things are a good deal less straightforward. Enough has probably been said in the earlier part of this paper to indicate the kind of answer that might be given, and there is no need to spend very long on it now. It should already be clear that we have to admit that we are not dealing with mere exposition of a difficult thinker. At this point it might be as well to state that what is being said does not imply that it is possible to explain a philosophical text without some involvement in philosophy, and perhaps some proneness to introduce one's own opinions. Nevertheless, the Neoplatonic commentators are a special case. Like some of the scholastics, the Neoplatonists' professed aim was to expound a given body of truth: for the Neoplatonists this was the philosophy of Plato, with which that of Aristotle was held, in the main, to coincide. It should not need to be said here that the words that are presented as an interpretation of Plato (whether with obvious labels like Proclus' *On Plato's Theology* or others less obvious like the *Enneads*) are in fact presentations of views which Plato would not have recognized as his own without becoming the victim of an elaborate Socratic elicitation of truths that he never knew he knew. With Aristotle the situation is not all that different, for the reasons we have mentioned. To these we may add the local conditions in Alexandria in the time of Ammonius and Philoponus which made Aristotle preferable as the vehicle for Neoplatonic philosophy.<sup>50</sup> Some of the differences might be attributed to the nature of the Aristotelian treatises discussed, for these afford only the occasional opportunity for the higher flights of Neoplatonic speculation. If we had a set of commentaries on the *Metaphysics*, things might be different: that of Syrianus on a few of the less potentially explosive books of that work is sufficient indication of what can be done.

By way of summary let us review our initial questions. "Two?" Yes, that is clear. "Two Christian?" To this the answer is less clear. One, certainly, that is Stephanus; the other probably yes too, but not to an extent or on doctrinal lines that would be easily detectable on any page of his commentary, and this, on the whole, is true of Stephanus too. "Two Christian commentators?" then, in the sense we have defined, No: even Stephanus offered primarily Neoplatonic exposition. Philoponus, as we have suggested, wrote a commentary not deeply imbued with such Christian convictions as he may have held at the material time. If his course had included one, it would be particularly interesting to have Stephanus' equivalent of Philoponus' general introduction to Book 1, in which he sets out his own views, and which is full of the sort of Neoplatonism that would be likely to give doctrinal offense. Possibly in the interval the climate of opinion which Justinian was trying to promote by his measures, such as they were, against the

public teaching of pagan philosophy<sup>51</sup>—and I would strongly stress public—may at last have had its effects. But that is speculation. Speculation should, of course, normally be discouraged, but I would like to close with some more. It has never been clear why, instead of Philoponus' commentary on Book 3 of the *de Anima*, we have that of Stephanus. Philoponus' was not lost. It was still available to Moerbeke in the thirteenth century and to Sophonias perhaps a century later still.<sup>52</sup> Yet our earliest manuscripts of Philoponus, which date back to the eleventh and twelfth centuries,<sup>53</sup> already contain the pseudepigraphic commentary for Book 3. Is the reason perhaps that at the time when these manuscripts, or their predecessors, were compiled, Philoponus' work was regarded as suspect—whether the cause was such apparent paganism as impressed itself on contemporaries like Cosmas and some modern scholars, or his notorious monophysitism—and the opportunity was taken to substitute the work of Stephanus on that part of the *de Anima* which was, more than any other, theologically delicate?<sup>54</sup>

## New Objective Links Between the Pseudo- Dionysius and Proclus

HENRI-DOMINIQUE SAFFREY

I already drew attention, twelve years ago, to "a (first) objective link between the Pseudo-Dionysius and Proclus." In fact, I had then proposed to explain the formation of the Dionysian *hapax legomenon*: *theandricos*, as a derivative of the name Theandrites of a Semitic divinity in whose honor we know that Proclus composed a hymn. Allow me to recall the result I arrived at: "The Semitic god Theandrios, honored in Arabia, was known to Proclus from his journey to Asia. He consecrated to him a hymn under the name of Theandrites. This hymn was familiar to the Neoplatonic school. Marinus and Damascius make allusion to it. John of Scythopolis (the first commentator of the Dionysian Corpus), without wanting to, likewise betrayed the knowledge he had of it in trying to justify in the Pseudo-Dionysius a facile and culpable concordism. In the same stroke, he established an objective link between the Dionysian Corpus and the milieu of the school of Proclus and of his immediate successors."<sup>1</sup> I had described this link as *objective*, since it depends neither on a hypothesis on the identity of the author of the Dionysian Corpus, nor on a doctrinal interpretation.

It is proper, indeed, to note that the Dionysian question has been most often

raised with the sole purpose of identifying the anonymous author who hides behind the pseudonym of Saint Paul's convert, Dionysius the Areopagite. In my humble opinion, this undertaking is a priori hopeless. It consists, in effect, in constructing on the basis of some data contained in the Corpus, themselves more or less well interpreted, a sort of "identikit" picture of its author, and then in trying to put on this "identikit" picture a name drawn from the *Who's Who* of Christian society between, let us say, the third and the sixth centuries. I denounce this method as dangerous and illusory. It supposes, in effect, that one can on the one hand effectively construct a sufficiently exact "identikit" picture, and on the other that one has a quasi-complete knowledge of the prosopography of the Christian Empire—two conditions that are, on the evidence, beyond our reach. It is not surprising then that there have been proposed for the author of the Dionysian Corpus identifications as varied and fantastic as Ammonius Saccas, the master of Plotinus, or Damascius, the last diadochus of the Academy in Athens, or Peter the Iberian, or again, although this hypothesis is infinitely more reasonable, Peter the Fuller.<sup>2</sup> And many more! Ronald Hathaway has recorded twenty-two different identifications.

No less illusory, in my view, are the doctrinal interpretations and the vague parallelisms that led to seeing the Pseudo-Dionysius on the one hand as a disciple either of Plotinus, Iamblichus, Proclus, or Damascius, or on the other hand as either a father of the church connected with Origen or with the Cappadocians or with some heretical sect, or an obscure Oriental monk—in particular a Syrian. In this also, most often, they succeed only in explaining *obscurum per obscurius*.

I believe then that research must be pursued outside of these blind alleys, and it is a modest contribution in this direction that I want to present here. I propose then to expose some new links between the Pseudo-Dionysius and Proclus. These objective links, it seems to me, are of two kinds. First the links in vocabulary, that is, the words that are met with only in Proclus or the Pseudo-Dionysius or John of Scythopolis. These parallels in vocabulary seem to me particularly safe from any improper interpretation and can thus constitute a solid base for reasoning. Next, there are the structural links that disclose rigorous parallelisms in the structure of thinking. Thanks to the *Elements of Theology* and *Platonic Theology*, one is quite familiar now with the map of reality according to Proclus, and with how it differs, for example, from that of Iamblichus. One can thus investigate how the Pseudo-Dionysius took over these elements of structure and how he admitted them or did not admit them into his system. This particularly fruitful approach, which had been inaugurated in a very remarkable manner, in view of the state of the editions of the text available to him, by Hugo Koch in 1900 in his work *Pseudo-Dionysius Areopagita in seinen Beziehungen zum Neuplatonismus und Mysterienwesen*, has been brilliantly readopted in recent years on a much more solid basis by René Roques in *L'univers dionysien: Structure hiérarchique du monde selon le Pseudo-Denys* (Paris, 1954), and Jan Vanneste in *Le mystère de Dieu, essai sur la structure rationnelle de la doctrine mystique du pseudo-Denys l'Aréopagite* (Paris, 1959), works which deal principally with the *Hierarchies* and with the *Mystical Theology*; Eugenio Corsini, *Il trattato "De divinis nomini-*

bus" dello Pseudo-Dionigi e i commenti neoplatonici al Parmenide (Torino, 1962) and Bernhard Brons, *Gott und die Seienden, Untersuchungen zum Verhältnis von neuplatonischer Metaphysik und christlicher Tradition bei Dionysius Areopagita* (Göttingen, 1976), which have examined rather the *Divine Names*; and the latest in date, last but not least, Stephen Gersh, *From Iamblichus to Eriugena, an Investigation of the Prehistory and Evolution of the Pseudo-Dionysian Tradition* (Leiden, 1978). The results of these researches are impressive; they show a close structural connection between Dionysian thought and the Proclian stage of Neoplatonic doctrine.

Having said that, I shall follow now a third path, which I consider particularly fruitful for disclosing the objective links between the Pseudo-Dionysius and Proclus, that is the path I had already followed in my first study, that which consists in examining the scholia of John of Scythopolis. Indeed, if John of Scythopolis, as Hans Urs von Balthasar has shown,<sup>4</sup> is the first commentator on the Dionysian Corpus and probably an accomplice in what must be called the Dionysian fiction, it is without doubt no exaggeration to present him as the first to have systematically researched these objective links between the Pseudo-Dionysius and Proclus. What, in fact, does he set out to do? In reading the text of Dionysius, every time he encounters a term or an expression that might sound strange to the ear of a Christian who believed he was reading a contemporary of Saint Paul, he endeavors to answer in advance the objections that cannot fail to be raised. Naturally his intention is to justify the Dionysian fiction, but at the same time and without wanting to, he exposes it. We need only read him with attention in order to enter into his game and draw profit from it. Thus, as I demonstrated in my first article, in order to defend Dionysius for having constructed his neologism *theandricos* on the name of the Semitic god Theandrites, he shows us that he is quite familiar with the existence of this god and the devotion paid to him in the Neoplatonist school of Athens. We are at first surprised, but from that very fact we understand that he is showing the cloven hoof, and instead of justifying Dionysius, he is pointing out to us an objective link that exists between the Athenian Neoplatonic circle and himself, that is Dionysius also. That is why I should like to make an appeal here for the undertaking of a critical edition of these scholia and for the successful conclusion of the systematic study of them.<sup>5</sup> The following are other cases of the same type that will demonstrate to you the interest of this task.

As we know, one had not to wait until the sixteenth century to raise doubts about the authenticity of the Dionysian Corpus, since John of Scythopolis informs us that the citation by Dionysius of a phrase from Ignatius of Antioch, occurring in the *Divine Names*, had already aroused suspicions. Here is the note of John of Scythopolis on the Dionysian lemma: 'Ο θεῖος Ἰγνάτιος.' "These words," he says, "have led certain people to think they can reject the present treatise as not being by the divine Dionysius, since they say that Ignatius comes after him [they knew, in fact, through Eusebius of Caesarea, that Ignatius of Antioch had been martyred under Trajan, between A.D. 98 and 117, and according to the *Chronology* of Eusebius more probably in 107]; how then can someone who is later be cited?

But this is how they have thought it possible to arrange it. Saint Paul, who baptised Dionysius, was in time later than Saint Peter, whom Ignatius succeeded as bishop of Antioch at the time that Peter left for Rome; now, Saint Paul survived for a long time after the baptism of Dionysius, and Dionysius lived still later than Saint Paul. On the other hand," continues John of Scythopolis, "the evangelist John to whom Dionysius wrote a reply [this is Letter X of the Corpus] was deported to Patmos under Domitian. Thus Ignatius suffered martyrdom before Domitian, so that he is earlier than Dionysius." We can see that in order to defend Dionysius, John of Scythopolis does not jib at any improbability, even though it forces the chronology in an impossible manner. It is there that we discover, as I have said, his complicity in the Dionysian fiction, which makes him at the same time a privileged witness and a singularly suspect one.

But in the Pseudo-Dionysius there are not only fantastic chronologies; there are also expressions which, not being traditional in Christian literature, necessitated an explanation. Here is a good example of this. At the beginning of Chapter 9 of the *Divine Names*, Dionysius asserts that the following pairings of attributes are attributed to the Cause of all beings: "great and small," "identical and different," "similar and dissimilar," "rest and movement" [one may say in passing that one would recognize here the pairs of attributes of the One in the second hypothesis of the *Parmenides* according to the interpretation of Syrianus and of Proclus]. "Well," he says, "we must examine also all that is manifested to us from these statues that are the divine names, τούτων τῶν θεωνυμικῶν ἀγαλμάτων." I am obliged to translate literally this, at first sight, very strange expression: "those statues that are the divine names." At that point John of Scythopolis really felt it necessary to give an explanation and here is his gloss: "It is with perfect wisdom that he speaks of the statues that are the divine names, for he extends this notion which he borrows from the Greeks by applying it to the truth. The Greeks, as a matter of fact, made up objects resembling statues without feet or hands which they called Hermes; they made them hollow with a door in the style of cupboards. Inside these statues they placed statues of the gods they adored, and from the outside they closed the Hermes. These Hermes thus appeared valueless, but inside they contained the beauties of their gods. It is in this way then that this passage too must be understood: those names from sacred Scripture, such as 'small' or 'to be seated,' etc., which are used concerning the God who alone exists and who alone is real, are not worthy to be spoken of God; but if these names are explained and if they are interpreted in a manner worthy of God, then they contain, within, the statues and the divine imprints of the glory of God."

Here is a very interesting passage and a very significant one. The comparison of the divine names with the statues of the gods is habitual in the Athenian Neoplatonists. It is met with in Proclus in the chapter devoted to *Divine Names* in the *Platonic Theology*, Book I, chapter 29: "Just as," says Proclus, "the demiurgic intellect brings into existence in matter the appearances of the very first Forms it contains in itself, produces temporal images of eternal beings, divisible images of indivisible beings, and from beings which are really beings produces images which have the consistency of shadow, in the same way, I think, our scientific

knowledge also, which takes as its model the productive activity of the Intellect, makes by means of discourse similitudes of all the other realities and particularly of the gods themselves: what in them is without complexity it represents by the complex, what is simple by the diverse, what is unified by multiplicity. Since then it produces the names in that way, our scientific knowledge presents them in this ultimate degree as images of divine beings; in fact, it produces each name as a statue of the gods, and just as theurgy invokes the generous goodness of the gods with a view to the illumination of statues artificially constructed, so also intellective knowledge related to divine beings, by composition and divisions of articulated sounds, reveals the hidden being of the gods." As theurges animate the statues of the gods and there demonstrate their presence, so language in composing the names of the gods expresses their nature and makes them present intellectually.

This doctrine is constant in Proclus and this passage is not an isolated one. Here for example is what he says again in his *Commentary on the Cratylus*.<sup>9</sup> He asks himself: "In what consists the art whereby names are made?" And he replies: ". . . It is that there exists in the soul a certain power which has the capacity to make copies . . . and by virtue of that power, the soul can assimilate itself to superior beings, gods, angels, demons; . . . that is why it makes statues of gods and of demons; and when it wants to bring into being likenesses, in a certain way immaterial and engendered by reason alone, of the First Beings, it produces out of itself, and with the help of verbal representation, the substance of the names; and just as the art of mysteries by means of certain ineffable symbols makes the statues here below like the gods and ready to receive the divine illuminations, in the same way the art of the regular formation of words, by that same power of assimilation, brings into existence names like statues of the realities. . . ." This passage is still clearer than the preceding one: through language, the soul makes verbal representations of the gods, as the sculptor carves their statues. To finish, in a quite general formula in the *Commentary on the Parmenides*,<sup>10</sup> Proclus states: "The names, since they are rational statues of the realities, are as a first consideration the names of immaterial forms, and as a secondary consideration the names of sensible forms." This doctrine of the divine names considered as verbal statues of the gods is thus well attested in Proclus.

Nevertheless, it must not be concluded from this that Proclus was its inventor. It is probable that he has taken over this comparison from his predecessor Syrianus, for we know of two texts in which we find an echo of the views of Syrianus on this subject. As is known, the *Commentary on the Phaedrus* of Hermias, the fellow-pupil of Proclus in the school of Syrianus, is no more than the report of the lectures of their common master.<sup>11</sup> The author wonders why Socrates accuses himself of having sinned against the divinity; it is, he says, because he used the name of the god Eros in the manner of the common man, "for," he adds,<sup>12</sup> "the names of the gods must be adored where they happen to be placed, as are their symbols, their statues and their images, which the soul holds as sacred." Here the divine names are objects of adoration like the statues. The other text comes to us from a contemporary of Syrianus, who had studied with him in Athens, Hierocles,<sup>13</sup> who

says, in his *Commentary on the Golden Verses*,<sup>14</sup> that "the name of Zeus is a symbol and a sonorous expression of his demiurgic being, from the fact that the first people to have given names to realities, by these names as by means of images caused their powers to appear, in the same way that the best carvers of statues do so by a superabundance of technical ability." Here also, the name of Zeus is considered as a sonorous expression, whereas the statue is a visual image of it. One sees that in these two texts, which could have been written in the generation that precedes Proclus, his theory of the divine names, statues of the gods, was in the course of formation. Finally, it is Damascius, in what remains to us of his *Commentary on the Philebus*, who brings us a last testimony from the same period. When he is commenting on the famous remark of Socrates in the *Philebus*,<sup>15</sup> "I have always had for the names of the gods ■ more than human reverence, a fear which goes beyond all bounds," he informs us that a certain Democritus called the divine names ἀγάλματα φωνήεντα, "vocal statues" of the gods.<sup>16</sup> Naturally this Democritus is not the one from Abdera, and L. G. Westerink has identified him with a Platonist who must be placed in the generations after Iamblichus since he is again cited by the same Damascius, in his notes on the *Phaedo*, where his opinion is adduced after that of Theodore of Asine, the contemporary of Iamblichus, and in combination with that of Plutarch of Athens, the master of Syrianus and Proclus.<sup>17</sup>

Thus, all these testimonies agree in bringing us back to the beginning of the fifth century, to the time when Plutarch of Athens and Syrianus were teaching in the Neoplatonic school in Athens. All the same, a proof *a contrario* of the fact that it is impossible to take this doctrine of the divine names considered as divine statues back as far as Iamblichus can be drawn from two texts. The first embraces chapters 4 and 5 of Book VII of the *De mysteriis* of Iamblichus.<sup>18</sup> It is here that we find Iamblichus engaged in justifying the religious use of divine names without apparent significance or even of names that he calls "barbaric," that is, purely and simply transcribed from ■ language alien to the Greek. If these names have to be used, for Iamblichus as for the whole Greek tradition, it is evidently because they express in a mystical manner the divine essence itself. But never does he establish the parallelism between the divine names and the statues of the gods. Yet it is there that one would have expected this development if it had already been in fashion. But here is a still more precise example. In ■ letter from the emperor Julian, the disciple of Maximus of Ephesus, himself of the second generation after Iamblichus, there is a very clear allusion to three degrees in divine representations: there are the gods themselves beyond all representation; next there are the stars which are visible gods, images of the invisible gods; but as one cannot offer them corporeal worship, there are finally the statues of the gods. Here it is ■ question solely of material statues, and not at all of those "rational" or "vocal" statues that are the divine names.<sup>19</sup> For Julian also, what will become the theory of Proclus has not yet been developed.

One may moreover suspect the reason why the Platonists of Athens developed this theory of divine names as spiritual substitutes for the statues of the gods, is that through the effect of imperial decrees, the statues of the gods began at that

time to disappear from their temples. We know that Proclus was an eyewitness to the removal of the statue of Athena from the Acropolis of Athens, and that at the time at which this was happening, he saw in a dream the goddess herself who said to him: "Lady Athenais intends to stay with you."<sup>20</sup> Dating from that day, she would have as temple the home of Proclus, and would be honored in his heart and that of his disciples. It is then only to the Platonists of the generations of Syrianus and of Proclus that one must attribute this devotion to the divine names as having taken the place of devotion to the statues of the gods. As John of Scythopolis saw perfectly, the expression of the Pseudo-Dionysius, "the statues that are the divine names," can only be understood in this context, and moreover that is what he explicitly states when he writes: "Dionysius transfers this notion which he borrows from the Greeks in applying it to truth."

But he still says something more. Indeed John of Scythopolis illustrates this doctrine by an argument that one could describe as drawn from folklore, the custom of the Greeks, according to him, of making statues containing inside them other statues for the worship of the gods, placed there as if in cupboards. To my knowledge, this supposed observation is not confirmed by any archaeological discovery. But it is evidently not an observation,<sup>21</sup> but a literary reminiscence, and from a famous text, that of the *Symposium* of Plato, in which Alcibiades compares Socrates to a Silenus. The passage is familiar:<sup>22</sup> "Socrates is just like those Silenus figures that are seen displayed in the sculpture studios and which the artists represent holding a pipe or a flute; if they are opened in the middle, it can be seen that inside they contain figurines of gods," a comparison taken up again and developed a few lines further on:<sup>23</sup> "Socrates is ignorant of all things, and he knows nothing, but he gives himself airs! Is this not the behavior of a Silenus? Yes, nothing could be more so! This ignorance, in fact, is the outer wrapping of the person, just as the carved Silenus is; but inside, once it is opened up, of what a great quantity of wisdom is it full, have you any idea, companions of this feast?" There should be no doubt that it is this comparison by Alcibiades between Socrates and a Silenus that John of Scythopolis has in mind, for no Hermes has ever been seen to be hollow and serve as a cupboard for relics, but if one considers that the word that has been translated as "sculpture studio" is in Greek τὸ ἐρμολυφεῖον,<sup>24</sup> which means literally "a place where Hermes figures are carved" (a Hermes indicates in this case a statue in general), one will guess that it is from this that John of Scythopolis has taken his Hermes figures that have taken the place of the Silenus figures that were no longer made in his time, though there still existed in Athens "the street of the statue-makers" of which Plutarch speaks in his treatise *On the demon of Socrates*.<sup>25</sup> And if there is need, we would be confirmed in this conviction by another literary reference to this same passage of the *Symposium* that we find in a letter of Synesius of Cyrene who must have belonged to the same circle as Proclus and the Pseudo-Dionysius, where it is said that "in Athens the craftsmen made statues of Aphrodite and the Graces and divine beauties of this kind, enclosing them in statues of Silenus and of satyrs."<sup>26</sup> Now it is well known that this type of literature regurgitates literary reminiscences rather than concrete observations. However this may be, if we are to consider this little dissertation of John of

Scythopolis as a literary reference to the *Symposium*, this reference brings us back once again to Proclus, for there is no evidence, as John M. Dillon has noted, for a commentary by Iamblichus on this dialogue.<sup>27</sup> On the other hand, a valuable scholium to one of the dissertations of Proclus on the *Republic* provides us with an explicit reference to a *Commentary on the discourse of Diorima* by that author, which could have been a part of a complete commentary on the *Symposium*.<sup>28</sup> In any case, in the *Commentary on the Alcibiades*,<sup>29</sup> we can read from the pen of Proclus a precise reference to the passage in the *Symposium* with which we are concerned: "That the young man [Alcibiades] . . . has been made better, one can see," says Proclus, "in the *Symposium* of Plato, where even in a state of drunkenness, Alcibiades is represented as full of admiration for 'philosophic discourse' . . . and swearing that he condemns not only himself but also his ignorance of himself each time he listens to Socrates speaking and remains in blissful admiration for 'the interior statues'<sup>31</sup> of his virtues which are so worthy of veneration and respect." This is a direct allusion to the comparison of Socrates with a Silenus in appearance ugly and filled with interior beauties.

All this analysis leads us, again in this case, to the following conclusion: we cannot understand this bizarre expression "the statues that are the divine names" used by the Pseudo-Dionysius, except with reference to a doctrine and a mode of speech in common use in the fifth-century Neoplatonic school of Athens, and the very suggestive explanations of John of Scythopolis bring us back directly to the master of that School, the Neoplatonist Proclus. Here also, I believe, one must speak of an objective link between the Pseudo-Dionysius and Proclus.

Here again is another example, less picturesque but not less significant. At the beginning of the treatise on the *Divine Names* (chap. 1, par. 4), Dionysius wishes to recall what he calls "the song of praise of the theologians," that is, the names of God which evoke his beneficent action towards us.<sup>32</sup> These names are Monad and Henad, which signify our unification, and Triad, which signifies the existence of all things, a cause which is described as wise, beautiful and friendly to men. It is to be noted that only the last name is really evangelical, since it is drawn from the "philanthropy of God" announced by Saint Paul in his Epistle to Titus.<sup>33</sup> After this list, Dionysius continues on: "And all the other theurgic lights" that he has received from Holy Scripture (τὰ Λογία) and from his divinely inspired masters (οἱ ἐνθέοι ἡμῶν καθηγέμενες).<sup>34</sup> One will agree with me that this language is not at all biblical nor even patristic; it can be clearly recognized as that of Proclus, when he speaks, as so often he does, of the *Chaldaean Oracles*, which are in fact his Holy Scripture, and of his master Syrianus, who is his true theologian. To mention it in passing, investigation has not yet been concluded on the borrowings of Dionysius from the language of the *Chaldaean Oracles* which were long since pointed out by Willy Theiler in his review of the *Indices Pseudo-Dionysiani* in the *Theologische Literaturzeitung* of 1944.<sup>35</sup> Having come to the word *theourgicos*, John of Scythopolis felt that, here again and rightly so, an explanation must be given, and here is his gloss:<sup>36</sup> "He calls *theurgic lights* the teachings of the saints, in so far as they produce a light of knowledge, and who make gods of those who believe." *Theourgicos* was the proper term for the author of

the *Chaldaean Oracles*, themselves always designated under the title of *Logia*, and "to make gods" was a formal definition of theurgy. These words and their derivatives recur forty-seven times in the Dionysian Corpus,<sup>37</sup> and one can scarcely estimate the strange impression they could have made on the ears of Christians to whom these words were entirely new. It is true that Dionysius had not hesitated to call the eucharistic rites themselves τὰ θεουργὰ μυστήρια, the mysteries by which one is made a god.<sup>38</sup> That may be all very well again for the sacraments; however, that the lights of theology may be called "theurgic" is hardly a Christian claim, but links up with that of Proclus for whom faith in the *Oracles* "places not only the universal souls but also ours in the ineffable and unknowable class of the gods."<sup>39</sup> It is by no means a question of the traditional doctrine of the deification of the Christian, for to make gods in naming the gods is to elevate the believer to the divine level itself, the ultimate goal of pagan theurgy. Once again, to forestall any wrong interpretation of the words of Dionysius, John of Scythopolis offers us an explanation altogether pagan and without any basis in the Christian tradition. He does not even seem to take account of this!

Up to now I have shown that the scholia of John of Scythopolis very often play the role of indicators of objective links between the Pseudo-Dionysius and Proclus. I should now like to draw attention to the fact that there exist direct links between the Pseudo-Dionysius and Proclus, for there are in the works of Dionysius quotations from Proclus. Hugo Koch and after him Willy Theiler have already recorded a first quotation in chapter 2, paragraph 7 of the *Divine Names*.<sup>40</sup> Dionysius says, concerning the divine persons, the following: "We have received from the tradition of the Holy Scriptures that the Father is the divinity that plays the role of source (πηγαία, a word once again from the *Chaldaean Oracles*), Jesus and the Spirit are, if one may speak in this way, divinely born buds from a divinity capable of engendering God and, so to speak, flowers and lights above being." As one can confirm, these names are not used in this form of the Father, of the Son or of the Spirit, in the Bible,<sup>41</sup> but the last element of the phrase, οὓν ἀνθη καὶ ὑπερούσια φῶτα, is found exactly in the *De malorum subsistentia* of Proclus, speaking precisely of the gods and of their providence. This last text is preserved only in a medieval Latin translation that we owe to William of Moerbeke, but his Latin is a perfect transfer of the Greek: *velut flores et supersubstantialia lumina*.<sup>42</sup> By reason of this striking parallelism, the last editor of the *De malorum subsistentia*, Helmut Boese, felt authorized to detect in it a quotation, independent in both cases, from the *Chaldaean Oracles*, for one can discover in it the end of a hexameter. All the same a doubt remains, because the word ὑπερούσιος has never been attested in the *Oracles*. For my part, I should be inclined rather to recognize a liberal Proclian combination of words coming from the *Oracles* (the words "flowers" and "lights") and to think that it is in Proclus, and in this treatise from which, moreover, he so abundantly drew inspiration, that Dionysius found this combination of words that fascinated him.

But here is another example which appears to me to be beyond doubt. This quotation is found also in the *Divine Names*, in chapter 5, paragraph 5. Let us recall that in the scholia of John of Scythopolis on the preceding paragraph which

treats of the eternity of God, Werner Beierwaltes and his collaborator Richard Kannicht discovered extensive use of the treatise of Plotinus on the same subject.<sup>43</sup> In this paragraph, Dionysius wishes to move from beings and eternities to their cause, and this is what he writes:<sup>44</sup> "For all beings and for all eternities, existence comes from Him who preexists. All eternity and all time came forth from him, and He who preexists is the principle and cause of all eternity and of all time, briefly of all that exists in any way whatsoever, that is that everything participates in him and he is never separated from anything. He is before all things and everything subsists in him." In that last phrase: "He is before all things and everything subsists in him," one will have recognized a word-for-word quotation from Saint Paul (Colossians 1:17), which will not be surprising from the pen of Dionysius. But in the preceding phrase, which defines in some way the manner in which He who preexists all (that is, the First Cause) is principle and cause, when Dionysius says: "Everything participates in him and he is never separated from anything," I recognize a quotation no less literal from Proclus, for it is in these terms that he also defines the First Cause in at least two passages of the *Platonic Theology*. Here is the first:<sup>45</sup> "It must be," says Proclus, "that the first principle of all beings is participated in by all, since it can never be separated from anything, being the cause of all that is said to exist in whatever manner." And the second:<sup>46</sup> "It must be that the cause of everything that exists is that in which everything that exists participates . . . and which is never separated from anything of that which is said to exist in any way." One may note the perfect identity of expression in Proclus and in Dionysius, and moreover the second part of the formula, "which is never separated from anything," comes directly from the *Parmenides* of Plato.<sup>47</sup> In quoting Proclus in this way, Dionysius lets it be seen in which school he was trained, and naturally he has sought to mask this dependence by the quotation from Saint Paul which he coupled with that from Proclus. This is a process with which he is quite familiar. Some lines further on,<sup>48</sup> Dionysius replaces the word designating the Platonic ideas, τὰ παραδείγματα, by the word, οἱ προορισμοί, introduced as a word derived from theology, ἡ θεολογία. One would be quite at pains to find this word in the Bible. It is met with in Origen in the sense of a "decree of the divine will," but it is the gloss of John of Scythopolis that shows the way, for he reveals that this word is drawn by Dionysius from the very προορίζειν used by Paul in Romans 8:30, "those he has predestined."<sup>49</sup> Those determinations in God whereby he predestines the elect, these are the Ideas—a purely nominal Christianization of a Platonic notion, and an interpretation quite peculiar to the Pseudo-Dionysius, without real support in the patristic tradition; and once again, a subtle trace of the connivance of John of Scythopolis with Dionysius, since it is only through his gloss that we understand the origin of a term which the editors had never been able to discover.

Before finishing, I should like to recall the very fine study by the late Sheldon-Williams, *Henads and Angels: Proclus and pseudo-Dionysius*.<sup>50</sup> One will be able to reread it in the light of what we have established in the introduction to volume III of the *Platonic Theology* of Proclus on the origin and the significance of the doctrine of the divine henads.<sup>51</sup> The inquiry into the use of the word "henad" in

philosophical and theological literature between the fourth and the sixth centuries has revealed that this word is very rare before Proclus and that in particular it is completely unknown to Iamblichus and his disciples.<sup>52</sup> And now we know that it is Syrianus who, in his interpretation of the first and second hypotheses of the *Parmenides*, invented the doctrine of the divine henads as the first degree in the hierarchy of the gods below the One, True God. Proclus, through his *Commentary on the Parmenides* and his *Platonic Theology*, was the great diffuser of that doctrine. That is why the simple fact that we find the word "*henas*" employed seven times in the work of the Pseudo-Dionysius, classes it automatically in the line of Syrianus and Proclus.<sup>53</sup> And the fact that he speaks in the plural of "the angelic henads," thus identifying the angels with the henads,<sup>54</sup> and calls God: "the unifying Henad of all henads,"<sup>55</sup> recalling the term of Proclus "Henad of the henads" used for the One,<sup>56</sup> shows that he was familiar with the doctrine of the divine henads. Of course he could not accept it as it was, and it was not to appear in his work except by implication. Nevertheless, the trace of it that we find once again constitutes an objective link between the Pseudo-Dionysius and Proclus.

At the conclusion of these reflections I must guard against falling myself into the temptation of making identifications that I criticized at the beginning. All I have wanted to do was to produce evidence of new objective links between the Pseudo-Dionysius and Proclus. I remark only that they increase and multiply accordingly as the research proceeds, and I am sure that still many more of them will be discovered. I shall only say in conclusion that by this means are confirmed two statements in relation to the Pseudo-Dionysius, the first by one of the earliest and the other by the most recent of the historians of Neoplatonism. The first is that of Thomas Whittaker who presented Dionysius as "some Christian Platonist trained in the Athenian School;"<sup>57</sup> the other is that of Carlos Steel who has recently characterized the Dionysian Corpus as the final stage in that sort of rivalry between pagan Platonism and Christianity "which finally absorbed it and neutralized it as a pagan ideology."<sup>58</sup> It was merely to establish a dialogue which has been prolonged through the Middle Ages right down to our time.

## 8

## *The Problem of General Concepts in Neoplatonism and Byzantine Thought*

LINOS BENAKIS

Within the framework of a conference having as its theme the relationship between Neoplatonism and Christian thought, the object of my paper is to point out the relationship between the two traditions on a specific problem. This is the problem of "universals," *universalia*, with which the philosophy of the later Greek and medieval periods, both in the West and in the East, was very much concerned.

I shall not therefore deal with the general problem of the relationship between Neoplatonism and Byzantine philosophy. In my article "The Study of Byzantine Philosophy: Critical Survey 1949-1971" (Athens, 1971),<sup>1</sup> I have reviewed critically some earlier approaches to the presumed total dependence of the Byzantines on Neoplatonism, and have drawn attention to other, more correct, views presented in more recent publications, which defend the position that external similarities (basically in terminology) and partial relationships do not imply substantial internal general dependence. However, this basic issue is not directly affected by whatever conclusions may be established through the analysis of the special theme under consideration here.

Thus I can enter directly upon my subject, taking as my starting point a passage from a representative treatise by the Byzantine philosopher of the thirteenth and fourteenth centuries Nicephoros Choumnos (d. 1327), which has the characteristic title "Discourse against Plato regarding Matter and Forms, that neither is matter prior to bodies nor are species separate, but these are together."

The philosopher categorically rejects both the existence of separate (Platonic) Forms prior to the Creator and the creation of the world out of preexistent and uncreated matter, in order to defend the thesis of "continuous procreation," that is, the uninterrupted successive presence of the Forms in the perceptible world and hence its "incorruptibility." Nicephoros Choumnos' thesis is found in the following paragraph (lines 261-276 in my translation):<sup>2</sup>

Nor is it correct for us to conceive Forms that have a permanent separate existence and are prior to those things whose Forms they are. The contrary is true. Because, since the first man was created by the Creator in the manner we have said—namely as a reasoning mortal animal made to give birth to his own kind and not to one different from him, indeed having this capacity as something which belongs to his substance—every other man who has come into being from him has exactly the same shape, kind, and substance as the first man was made to have.

Therefore, by proceeding inductively from all individual instances of man and by looking at the first man, and also at those after him, and so on continuously, we find that which is common to all and has not changed in the slightest. This we recognize as the species of man; in defining this, we say that man is a reasoning mortal animal, and this definition is valid for every man and for his kind.

In this manner, therefore, the Form and the kind are not prior to the particulars (as Plato says), but rather they are *what we conceive afterwards with the mind and thus define accordingly*.

Choumnos' view of the Forms is an inevitable consequence of his rejection of the self-existence of Form and its ontological presence prior to sensible particulars. Since the Forms acquire existence only in formed creations, they are perceived only *a posteriori* at the time when the knowing subject discerns them on the basis of the common characteristics which are to be found in all individuals of the same species and thus constitute the basis for their definition. (Our philosopher's position becomes clearer with the application of this principle, as we have seen above, to the example of man.)

It is clear that this fourteenth-century philosopher has understood the transition in meaning from "Forms" to "general concepts"; and in a way that enabled him to take a stand in relation to the so-called "*universalia* problem."

Now that our knowledge of the historical perspective and of related texts has been improved,<sup>3</sup> I believe that this Byzantine philosopher's formulation—which holds for other earlier Byzantine philosophers as well—also indicates his dependence, in his questions, terminology and solutions, on the systematic discussion of certain issues in the Greek philosophy of later antiquity. These issues involved questions as to what the Forms (the universal substances) represent as general definitions of beings (1) in themselves, (2) in relation to sensible individual things ("the many"), and (3) in relation to the knowing subject.

The answers to these questions were elaborated for the first time and with a clear metaphysical reorientation, as we shall see, in the Neoplatonic school of Alexandria in the fifth and sixth centuries both by its leader, Ammonius of Hermias, and his disciples and successors, Asclepius, Olympiodorus, Philoponus, Stephanus, Elias, David, and others, all commentators on the logical writings of Aristotle.<sup>4</sup>

This particular branch of Neoplatonism, in its interpretation of Aristotle, shows, comparatively speaking, the smallest influence of Neoplatonic doctrine. For this reason, the commentaries of Ammonius' disciples on Aristotle served as the most conducive bridge for the teaching of Greek philosophy in the Christian world. With regard to the mode of existence of an ultimate reality, the Alexandrian school did not espouse extreme positions and, hence, it adopted a moderate solution to the problem of general concepts.

The formulation of the problem by the Alexandrian scholiasts, its influence on the later Greek-Byzantine tradition, on Arabic philosophy and on the thought of many well-known Western philosophers, forms one of the new chapters in the history of the problems of ontology and of knowledge in their later phases. It is a chapter that still awaits its final form, hopefully to replace what we read in the accounts still presented in various histories of philosophy and in monographs on the *universalia* problem.

This is not the occasion to present a more systematic exposition of the *universalia* problem from its beginning up to the period which interests us. I would like only to draw attention to the fact that we must place within the historical period I have mentioned the emergence of a new solution that diverges basically from "Platonism" (by which of course I mean every type that meets the prerequisites of realism but is not restricted to the historical Plato), namely the solution of "conceptual realism" (or "conceptualism" where the term is not taken in the psychological sense). This is the interpretation of the universal as a concept of the knowing subject (ἐν τῇ διανοίᾳ, *conceptus mentis*), a concept no longer regarded as prior to sensible things (*ante res*), nor simply in things (*in rebus*), but derived from individual sensible things through the conceptual apprehension of their common characteristics.

It is this position which emerges with the elaboration of the problem by the Alexandrian Neoplatonists on the basis of a Neoplatonic transformation of the Aristotelian teaching on substance, and in association with the preservation of the Platonic Forms conceived now as *the thoughts of the demiurge*, the God-Creator.

In our opinion, this solution represents more fully the Greek medieval tradition, and must be considered a variation of Platonic and Aristotelian realism and not of nominalism, as it is usually called and which prevails in Western philosophy where this variation is also present as a compromise between realism (Scotus) and nominalism (Roscelinus), making its appearance with the influence of the Arabic philosopher Avicenna (who borrows from the school of Ammonius) on Anselm (d. 1109) and particularly on Abelard (d. 1142).

Aristotle's criticisms of Plato (to a certain degree well-founded, in other ways not) also obviously belong to the history of the problem of the nature of general

concepts. Since the arguments are complex, I will point out only those elements which have influenced the formation of the *universalia* problem in postclassical and medieval thought.

The Aristotelian criticism was valid in the case of the so-called "third man" argument, and so as long as it was directed against the doctrine of the Form as "exemplar" and of natural things as its "images." Specifically, the Aristotelian criticism focuses on the objectivization of ideal beings (and more precisely on their transformation into things of the same ontological type as concrete objects), but it does not at all deal with the principally Platonic doctrine of the existence of ideal beings.

From the criticism of Aristotle it does not follow that Forms do not exist, but only that, if they exist, they cannot be something of the same type as that of individual sensible things.

From this perspective, it becomes clear why we must not bring Aristotle into the realism (Platonism)–nominalism dispute. The Aristotelian position must be classified, not under nominalism, but rather under realism. Aristotle is in fact in substantial agreement with Plato on the position that it is not possible for scientific knowledge to exist if we deny some sense of objective reality to the universal. The difference between Plato and Aristotle is that the latter believes that it is not necessary to attribute a *separate* existence to the universal. The universal (the Aristotelian kind, εἶδος) exists, but only together with the particulars and within them.

This means that both philosophers agree on exactly the same point, once we locate the weakness of the Platonic system (that is, that in order to explain the possibility of general [scientific] knowledge, it is not necessary to accept, as Plato does, abstract ideal objects). But of course the position of Aristotle was too far from a semantical interpretation of language to be able to solve the problem of knowledge of the universal without its direct association with the existence of ideal substances.

The opposition to which later metaphysicians attached such significance was formulated, as we know, as follows: Plato accepted "universals prior to the sensible objects" (*universalia ante res*); Aristotle held that "universals are in the objects" (*universalia in rebus*).

From the metaphysical viewpoint of each philosopher, the contrast becomes profound: Plato deifies the form (ἰδέα) and undervalues the world of sensible objects; Aristotle bases his realism on the role of "first substance" (πρώτη οὐσία, substance in the primary sense). But if we strip the problem logically of its metaphysical appendages, that is, if we eliminate the issue of whether the universals are prior to the objects or are in the objects, we may come to regard it today as being basically a pseudo-problem arising from the tendency to objectify or concretize universality, a tendency which was cultivated persistently in post-classical and medieval philosophy.

We insist, therefore, on the assumption that the only problem, which there is any sense in putting forward, is the simple question of whether ideal abstract objects *exist or not*, whether they have an objective reality or not.

Nevertheless, in the historical course of questioning, the contrast prevails between the two teachings on the "place" (location) of universals, a contrast which is sustained, as we have said, by the spirit of an era in which the objectivization of conceivable Being leads to the *universalia* problem. This tendency becomes even more pronounced when the nominalistic solution is added: *universalia post res* (the universal is merely a subjective concept subsequent to the object; the universals are neither abstract beings nor attributes common to their particulars, but general words, simple names, creations of the mind, *flatus vocis*).

In this paper I am concerned basically with the starting point of the dispute, which I believe also explains its course within the Eastern branch of medieval philosophy, that of Greek Byzantium. This starting point is to be found in the era of the Neoplatonic commentators on Aristotle. During this period one further transformation of the Platonic Forms was brought about. Nurtured in the New Academy or in the Middle Stoa (Posidonius), and intensively cultivated by Philo of Alexandria, it passed as a generally accepted interpretation in Middle Platonism, Neoplatonism, and in Christian writers. It is the *identification of Forms with the thoughts of God*, and furthermore with the creative intellect, the *Nous* of the demiurge.

Without intending to disregard the fact that we find the first seeds of the problem regarding general concepts much earlier in the Cynics (Antisthenes), in the successors of Plato and Aristotle (Xenocrates and Xenarchos, first century B.C.), as well as in the Stoa and Plotinus, it is indisputable that Porphyry (in the third century) was the first clearly to formulate the problem in the very first paragraph of his famous *Isagoge*.<sup>7</sup> Porphyry here posed three questions:

1. Are the kinds and Forms (general classes and characterizations of identical forms) existing substances or do they exist only in the mind (are a subjective concept)?
2. Do they have bodily substance or not?
3. Do they have an existence separate from sensible objects or do they exist only in them?

The first question is the only acceptable one from a scientific point of view, as we have already explained.

The second question derives from the tendency to objectify ideal substances, as we have also seen.

The third question constitutes historically the first formulation of the problem *universalia ante res* (universals prior to the objects)–*universalia in rebus* (universals in the objects).

It is characteristic that Porphyry explicitly avoided taking a position on the questions which he himself formulated: "I shall refrain from speaking about these things, because the treatment of such a subject is extremely deep and needs another, more profound, examination." He never made this investigation in any of his works. This attitude of his certainly constituted a great stimulation for later discussions, which became ever more sharp since the questions were particularly difficult to answer.

Porphry's problematic soon passed into the West, thanks to the Latin translation of his *Isagoge* by Boethius (d. 525). Boethius, in the commentary which he wrote on the *Categories*, prescribed the solution which was later named "pure" (psychological) conceptualism: our mind has the capacity to separate (by abstraction) whatever appears inseparable in the sensible world.

In the East, the school of Ammonius (at about the same time as Boethius, who was also Ammonius' student, and about two centuries after Porphyry) formulated the same questions as follows, according to our free rendering:

1. Is there any knowledge of beings transcending our sense experience but having no less real existence and not being mere figments of the mind? In other words: Do the Forms or ideal beings, that is, the universals (genera and species), have existence in themselves, having thus, apart from their mental reality, also ■ suprasubjective reality?
2. (And since the answer to question 1 is affirmative), what exactly is this "reality" of the ideal beings?

As we see, the questions of the Alexandrian philosophers are correctly centered on the first and philosophically more legitimate question in Porphyry's *Isagoge*. In association with this first question, of course, the others can also be solved.

The problem of the real existence of mental (ideal) beings appears to be an acute one to the commentators of the school of Ammonius, *insofar as it has to do with the determination of the relationship between "first" and "second" substances* in Aristotle.

Why, Ammonius asks, does Aristotle name the concrete (individual) *ousia* "first substance," and the universal "second substance"—the latter being surely more primary, more important, superior (τιμιωτέρα)? Because, he answers, that which is prior in nature (the universal) is for us (as knowing subjects) secondary (posterior). From the particulars we are led to the general, to universals. For this reason, he comments, Aristotle was careful not to speak of first substance (particulars) as if "it primarily and in the highest degree exists" but says that "it primarily and most certainly is said" (not καὶ πρῶτως καὶ μάλιστα ἔστιν, but καὶ πρῶτως καὶ μάλιστα λεγόμενη).

Philoponus also explains the superiority of the universal (second substance) by the principle that "the cause has a higher degree of existence than the effect," and justifies Aristotle's terminology by saying that in the *Categories* the philosopher is speaking to novices, and that it is for this reason that he names "first" the substance, appears later, "after a long time, when reason has shone within us" from the particulars to the universal, because second substance, which is the main substance, appears late, "after a long time, when reason has shone within us" (ὁψέ, τοῦ λόγου ἐν ἡμῖν ἐλλάμψαντος).

Simplicius gives the same explanation (after he has pointed out the superiority of the universals "under which particulars are classed and from which they derive"). That is, in the *Categories* the investigation of substance starts out "from a semantic relationship" (ἀπὸ σημαντικῆς σχέσεως), and for this reason its exam-

ination is undertaken from the standpoint of first substances (those prior in relation to us, that is individual, sensible beings). Similar views are found in the other commentators of the same school.

Summarizing the position of the Alexandrians, we see that they accept a double order of beings: the order of the being of things and the order of the cognitive subject. The first order is manifested "in nature," independently of thought and human knowledge. It is the order and hierarchy of the first causes of beings which is reflected also in particulars but without being identical with these. The second order starts where the first ends, and, following an inverse course, tries to reach the beginning of being. While the first order is ontological and creative (Asclepius: οὐσία τῶν τῆδε προακτικῆ καὶ δημιουργικῆ), the second is cognitive or, rather, "recognitive." With regard to their courses, the two orders are not parallel but run in opposite directions.

In this analysis, the Neoplatonic scholiasts do not place simple general concepts in the first order, the order of universals (those prior in nature), but they see there a supersubjective reality. Even more, it is a reality prior to the mind of man, a reality given to him. Thus the universal, the ideal substance (genera and species), has priority in being and value in relation to concrete substance.

Thus, the universal-ideal substances not only have a reality independent of the knowing subject, but they also have an existence truer than that of sensible beings. The terms "more valuable," "to a higher degree," and "senior" (τιμιώτερον, καρείτον, πρεσβύτερον) for intelligible substance are not only symbolic but must be evaluated in the context of ontological definitions. The universal is the truly "first" substance (even if called the "second"), above the particular substance in the ontological order; and this primacy would not occur if the intelligible were purely a conceptual reality. (If that were the case, the intelligible would not determine the sensible, but the sensible would prescribe its rules to the rational.)

This evaluation of the degree of existence of the universal in relation to the particular has one more consequence: for the Alexandrian scholiasts, the particular has an even truer existence *within* the universal than it has by itself. Certainly this would be impossible if the universal had the mode of existence of a simple general concept of the mind.

Here a second group of problems appears, which leads to further discussion of the character of the reality of the universal. I can only state here the conclusion of this discussion.

The Neoplatonists accept a gradation of being and indeed within intelligible being. It is a gradation with reference not only to first (sensible) substance, but more importantly to second (intelligible) substance. The higher level is always the ontological basis (the presupposition) for the lower. The higher the ascent (ὑπερβεβηκέναι, ὑπερβάσις, ὑπερβατόν, terms used by the Alexandrians), the stronger and more comprehensive being, as supportive of other beings, becomes. In Ammonius' own formulation: κάτωθεν μὲν ἀπὸ τῶν ἀτόμων . . . πλήθει μὲν στενοῦται . . . δυνάμει δὲ αὖξεται."

We now come to the second question posed by the Alexandrian commentators: What actually is the real character of the existence of *universalia*? We have

first a negative definition (consistent with the above): The reality—the state of existence—of the ideal is not identical with the way in which sensible particulars exist.

One of the arguments for this is the following: species and genera (man, animal) “seem” (φαίνεται) to designate a concrete individual in each case, but in truth they designate plurality and quality, because they indicate the “community” and the “collection” (κοινωνίαν καὶ συναγωγήν) of particular substances. (For this reason, Ammonius says, Aristotle does not say that the form is “the what as quality” but “the what with regard to substance”: περὶ οὐσίαν τὸ ποῖον.)

Thus “universal” substance (1) is something distinct from concrete particular substance (without this implying its individualization—I simply mention the problem, since it figures in one of Aristotle’s arguments for the rejection of the Forms: the argument “of the doubling of the world”); (2) it also defines substantial quality and is not simply a qualitative predicate of particular substances (for this reason it does not need the qualitatively defined particular in order to exist, as the latter needs it).

Next follows a positive definition from which a really surprising thesis emerges: The universal needs the particular substance, not in order for it to exist but in order to be expressed in it (Ammonius: οὐ γὰρ δέεται τὸ καθόλου τῶν πρώτων οὐσιῶν, τοῦτ’ ἐστὶν τῶν μερικῶν, ἵνα συστή (πρὸς σύστασιν), ἀλλ’ ἵνα κατ’ ἐκείνων ῥηθῇ).

But I must now turn to certain final positions that are of direct interest for the later history of the problem of ideal beings or general concepts. For the Alexandrian Neoplatonic commentators:

1. The “separate” existence of universals does not have the same form as that of the sensible particulars. (Thus Aristotle’s criticism of Plato for introducing a “separation” of reality into two worlds through the theory of Forms is refuted.)
2. In the texts under consideration we do not have any hint that the commentators postulate a domain of Forms existing somewhere, close to, or outside, the natural world-order.
3. What is more, it is maintained that the Forms exist within particular concrete objects, or rather that the particular objects express the Form itself which appears in them.

However, the appearance of the Form does not mean that what appears (the phenomenon) is identified with the Form; the phenomenon does not cease to be the representation of the Form, its copy, a way for the Form to appear. And that is why the phenomena (the ways in which the Forms appear) are always inferior to their Form. (Compare the concept of the transcendence of the Form in relation to its representation in the sensible: transcendence has meaning precisely on the presupposition of a presence of the Form within the objects).

On the other hand (as has been shown above), the existence of the universal as universal does not cease with its presence in particulars. In the natural reality of time and space we also have gradations of being. The intelligible which is em-

bodied in the sensible is the strongest, the fullest region of being. Besides, this difference in the value of the intelligible region even in its bodily shape—given that the intelligible never coincides absolutely with its bodily shape—expresses a kind of “separation” of the intelligible from the natural. (We may note here the Platonic-Aristotelian opposition on the separation of the two world-orders and the reconciliatory efforts of the Neoplatonists.)

It is true that the terminology used by the commentators to express the above relationship gives at first sight the impression that they mean an existence of the universal which is independent from the particulars. But a careful study leaves no doubt that they accept different modes of existence in being as a whole; there are different degrees of ontological fullness in the gradations of being with regard to both the intelligible and the natural world.

Thus we learn that (as Philoponus says):

1. Particular concrete objects (first substances) constitute for being the subject or substratum (ὑπόκεινται) in either of the following ways:
  - a) for the qualities/events of the sensible world, so as to exist in the sensible world (ὑπόκεινται πρὸς ὑπαρξιν);
  - b) for the universals, so as to be predicated (ὑπόκεινται πρὸς κατηγορίαν).
2. The intelligibles and the phenomena are mutually dependent.

We cannot think of the intelligible as intelligible without contrasting it to the sensible. And we cannot speak of sensible phenomena without using simultaneously the concept of the intelligible. For this reason the mutual interdependence of the universal and the particular occurs not only in the region of the intelligible, but also in that of concrete individual existence.

We can now understand the final position, which has great significance: universals are necessarily subordinated to the function of our mind in apprehending and expressing them (νοεῖν καὶ λέγειν αὐτά). From this standpoint, their characterization as *a posteriori* (as subsequent to the particulars) becomes understandable. (I will return to this topic.)

At this point I shall simply refer to one interesting dispute of the Alexandrians with the most reliable commentator on Aristotle, Alexander of Aphrodisias. Olympiodorus and Elias defend the priority of the universal *in nature as well as in logic*. As we know, for Alexander, only the particulars are prior in nature. This simple reference is necessary in order to draw attention to a critical point which throws light on the final definition of the mode of existence of universals: the Alexandrians maintain that the universal is prior in nature even when they admit that the universal appears only in the particular sensibles and ceases to be in their absence.

But what ceases to be? That is the crucial point, ensuing from the discussion on the priority of what is prior in nature, and which has a bearing on the final solution. The universal which ceases to be in the absence of particulars is not that which is “prior to the particulars,” τὸ πρὸ τῶν πολλῶν (= the kind, the Form in the mind of the God-Creator, as we shall see), but *that which “applies to the*

particulars," τὸ ἐπὶ τοῖς πολλοῖς, namely the conceptual apprehension of the universal.

Thus we come to the final designation of the universal, according to the school of Ammonius. It must be understood as an attempt (1) to preserve the Platonic doctrine of the Forms as the ideal substances (models) of creation, residing in the mind of the Creator (as his thoughts). This last idea—that the Forms, which in the human soul are discrete and separate, are found collectively in the Divine Mind, being identical with it—is the result of the Neoplatonic transformation of Platonic and Aristotelian elements in the postclassical tradition (at least after Philo) of the doctrine of the Forms. It is a transformation which facilitated considerably the new solution.

It is also an attempt (2) to validate the thesis of the ontological priority and permanence of the universal against the sensible particular, since if the sensible (first substance) is abolished, it is not the universal (second substance) itself which ceases to exist, but only its apprehension by the mind.<sup>9</sup>

In conclusion, the solution involves a triple mode of existence of the universal.<sup>10</sup> Universals (genera and species) are, therefore, for the Alexandrian Neoplatonists:

1. *prior to particulars* (πρὸ τῶν πολλῶν), in the mind of the Creator. This doctrine is attributed explicitly to Plato and represents—as they believe!—his teaching on the Forms.<sup>11</sup>
2. *within the particulars* (ἐν τοῖς πολλοῖς), inseparable from the sensible concrete objects of the natural world. This is the Aristotelian "material form" (ἐνυλον εἶδος) or "first substance" (πρώτη οὐσία).
3. *applied to the particulars and conceptual* (ἐπὶ τοῖς πολλοῖς καὶ ἐννοηματικά). According to the precise formulation in Philoponus: "Those which are in our mind are seen to apply to the many particulars and are subsequent to them." (It is significant that Philoponus refutes here the opinion of a certain Eustathius, unknown to us, and that of Porphyry, and calls on "those who speak more correctly, of whom one is Iamblichus, who says that the aim of the Aristotelian *Categories* for the philosopher is to speak about the φωναί [meaning the five most general categories] signifying objects through their meaning.") From this passage it appears that the Alexandrian scholiasts consider also the third mode of existence of the universal ἐπὶ τοῖς πολλοῖς to be consistent with Aristotelian teaching, the most correct interpretation of which they find in the Neoplatonic branch headed by Iamblichus. Philoponus says explicitly: "Aristotle always calls genera those applying to the many (τὰ ἐπὶ τοῖς πολλοῖς) and being objects of our thought (ἐννοηματικά)." But it is clear that we have here Stoic influence, at least indirectly. Furthermore, there are other Stoic elements in the example of "the seal and its waxen copies" which the Alexandrians used.

Let us now reread the definition given by the Byzantine philosopher Nicephorus Choumnos: "Therefore, taking into consideration all men by induction and

looking at precisely that first man, who is the origin, and at those after him and so on continuously, that which we find common to all (ἐπὶ πάντων ταῦτόν) . . . this we recognize as the species (the general concept) of man," etc.

We can easily see the common line of thought which, it may be noticed, used a similar terminology.

We find this line of interpretation throughout the Byzantine period, specifically in the texts of Ioannes Italos (1023–ca. 1085), Eustratios of Nicaea (1050–1120), who is also a commentator on the *Posterior Analytics*, Nicephoros Blemmydis (1197–1272), and even later in Georgios Scholarios and Bessarion, but not in Plethon.

Unfortunately a treatise devoted to the subject by Photius (820–893), which he himself mentions, has not survived. But in his brief essay, "Various questions for discussion on genera and species," he shows clearly and vividly a knowledge of the history of the problem of general concepts. Photius gives us an original elaboration of only one specific aspect of this problem, Porphyry's second question as to whether the Forms are incorporeal or corporeal. Photius characterizes his own solution as "no less elegant than that of the Greek philosophers." His answer is as follows: "Universals are corporeal (not bodies) and indicative of subjects (not indicating themselves), developing the existence of these (not causing them to subsist) and reporting the substantification of the parts within them (not providing it) and are names signifying substances through appropriate meaning (names not possessed by the beings themselves)."<sup>12</sup>

In the same text we find a rejection of the Platonic Forms. He also clearly states that "the philosophers of better taste applied genera and species to the many and within the many" (τὰ μὲν ἐπὶ τοῖς πολλοῖς, τὰ δὲ ἐν τοῖς πολλοῖς). This means that Photius, too, is close to Aristotelian realism as the Neoplatonic scholiasts elaborated it. An important indication is the presence of the phrase ἐπὶ τοῖς πολλοῖς in his definition.

My thesis, therefore, is that in Byzantine philosophy the discussion of the problem of general concepts does not resemble the dispute as we know it in the West. In the Greek East, there is an almost universal acceptance of the solution of the Alexandrian Neoplatonic commentators of Aristotle, which we can characterize as (moderate) "conceptual realism." We do not find a nominalistic solution, because, as has been indicated, general concepts for them were not simple concepts or mere names, stripped of every reality and "existing" only in the human mind.

In fact, the new phrase which the Alexandrians introduce and the Byzantines adopt (ἐπὶ τοῖς πολλοῖς καὶ ὑστερογενῇ τὰ καθόλου: universals applying to the many and subsequent to the particulars) is not equivalent to the *post res* of the *universalia* dispute, that is, the position of the nominalists, as one might believe, and has in fact been maintained by some.

On the basis of the texts of Philoponus and also of those of the Byzantine Eustratios of Nicaea, who in his comments on Aristotle shows an admirable knowledge of the sources (this same Eustratios uttered the bold statement that "throughout all his divine sayings Jesus reasons in the Aristotelian way!"<sup>13</sup>), we see

that the *a posteriori* status of general concepts does not alter their "substantial status," their mode of existence. Their existence is always within sensible particulars and together with these; the universals that are conceived by the mind by abstraction of the common characteristics of the particular sensibles are the Aristotelian "second" substances (ὑστερα equals ἡμῖν δεύτερα).

There is one more reason why universals, as objects of thought, come after sensible substances. They are posterior to their creative and determining causes, namely the ideal substances in the mind of the demiurge. This last thesis is accepted particularly by Christian thinkers, who consider the Forms, as we have seen, to be the thoughts of the demiurge and the creative causes of all beings.

For a more analytical presentation of the Byzantine writers one would have to consult the texts, which unfortunately remain to a great extent unedited.<sup>14</sup> I wish only to refer to two recent publications of mine, which offer an interpretation of Byzantine philosophical texts, together with a new critical edition and with the necessary identification of the sources used: Nicephoros Choumnos, "On Matter and Forms"; Michael Psellos, "On the Forms of which Plato speaks." *Philosophia* (Athens), vol. 3 (1973) and vols. 5–6 (1975–1976).

One final remark: in the West the Alexandrian solution has rather the character, as I have said, of a compromise solution between the contrasting positions of realism and nominalism. It is represented in the twelfth century and thereafter by Abelard, Albertus Magnus, Thomas Aquinas, and others. The link is generally considered to be the Arab Avicenna (980–1037), who certainly borrows from the last scholiasts of the school of Ammonius, Elias and David. However, it would be interesting to investigate the Greek—Latin connection from as early as the time of Photius and after.

## *Medieval Latin Thought*

## *The Primacy of Existence in the Thought of Eriugena*

G. H. ALLARD

One can scarcely be mistaken in asserting that Neoplatonism—whether it be Christian or not—is fundamentally an “essentialist” philosophy: by that I mean that it is a system of thought at the core of which a universe of essences and intelligible beings is organized according to relationships of causality which are universal, timeless and necessary, a system in the face of which phenomenal realities possess little or no ontological density. In this respect the thought of Eriugena marks an important date in the history of Neoplatonism since it bears witness to a profound change in its customary perspectives. Indeed, the acute awareness that Eriugena has of the idea of existence, perceived as the ontological pole complementary to essence, leads him, so to speak, to shift the observation post of reality and to look in the other direction: the approach to being, to intelligible beings, is now mediated by existence, by “existents.” Polarized in this way, thought succeeds in integrating quite naturally the spatiotemporal realities and in conferring on them not only a decisive gnosiological function, but also a new ontological status. This increased sensitivity towards the idea of existence, need we emphasize, does not of course entirely destroy the quite Neoplatonic structure of Eriugena’s thought, but it does

already suffice to shake the edifice to the extent to which Eriugenian thought sets out to distinguish, in the heart of being, between what is (*quod est*) and the crude radical fact of existing (*esse*). I shall certainly not be able within the framework of this paper to examine the various influences which affected the thinking of Eriugena on this question;<sup>1</sup> but it does remain that the mental equipment which he inherited and which he transformed in such an original manner enabled him to make a completely new reading of the dogma of creation. It is precisely on this theme of *creatio ex nihilo* and on its philosophical consequences that I want first to spend a little time.

## I

My attention was drawn to this little explored dimension of Eriugenian thought on the occasion of the computerization of the text of his *Expositiones in Ierarchiam coelestem* which Mlle. Barbet has edited in the *Corpus christianorum* series (1975); together with my colleague S. Lusignan I had to consolidate the *index verborum latinorum* for both the commentary of Eriugena and the text commented on (Dionysius) and translated into Latin by Eriugena. When considering the range of frequency that the same word may undergo according to where it appears in Dionysius' commented text or in the commentary, I was struck by the frequency of the words relating to creation (*creator, creare, creaturae, ex nihilo*) which recur in fact 135 times in the commentary as against once in the commented text. To my first source of astonishment was added a second: in fact, I established that this single representative of the family of words relating to creation,<sup>2</sup> which occurs only once, could itself also have been completely absent from the *Celestial Hierarchy* if our translator had chosen, just as Hilduin did, to render the Dionysian *demiourgos* by the term "*opifex*." This "slight alteration" makes of Eriugena a very bad translator but perhaps a better philosopher than Hilduin; what is in any case certain is that this intervention reveals in him an obvious concern to adjust the Dionysian text to his personal problematics.<sup>3</sup> For Dionysius, as we know, the action of the demiurge is "an action organizing" things and relations between beings.<sup>4</sup> There is no doubt that the Dionysian demiurge is unique, transcendent, and is Providence; in this respect, we are here far from the hypostatic universe of Iamblichus or of Proclus.<sup>5</sup> But the question presents itself: is the god of Dionysius a creator in the biblical sense of the term, that is, the principle and cause of the radical appearing of things and beings *ex nihilo* in time and in space? The idea of *ex nihilo* is absent from the vocabulary and from the thought of Dionysius. This absence is significant; it indicates that Dionysius does not so much consider the question of the "radical origin of being," which is that of *existence*, as that of the intelligibility of "what is", that is, the necessary and intelligible order that governs beings and essences.<sup>6</sup> Thus it is being and the cause of being that holds his attention—his thought is polarized by the "what is," the essence, the substance, and he is consequently insensitive to the first springing forth of beings into intelligible or spatiotemporal existence. In this context, the demiurge is the cause and principle of *being* but not of *existence*; according to Dionysius' own terms, it is ἀρχή

... καὶ οὐσία . . . οὐσίας . . . πρὸς τὸ εἶναι παραγαγόν' or again αἰτίαν οὐσιοποιὸν εἶναι:<sup>7</sup> it is a manufacturer (*opifex*) of order among the essences (the beings), or better still it establishes and gives the rank of essence (being) to all that is as intelligible."

Eriugena is not unaware of the precise meaning of the action of the demiurge of Dionysius, for on occasion he translates very fairly the πρὸς τὸ εἶναι οὐσίας πρώτας παραγαγόν or the οὐσιοποιὸν εἶναι as "*causa substantifica*."<sup>8</sup> But it has not been sufficiently noted that each time he renders the Dionysian δημιουργός by "*creator*," Eriugena modifies its implication by adding a dimension alien to Dionysius because it is unknown to him. In Book III of the *De divisione naturae* (DDN),<sup>9</sup> the divinity is defined as a "*causa existentium omnium*"; still in the same book,<sup>10</sup> he takes up on his own account the celebrated eulogy that Dionysius addresses to Being (ON) in the *Divine Names*; but this time the divinity (the demiurge) is "*creator existentis subsistentiae*," "*existentis substitutor*," "*causa existentium*." It is for this reason that in the *Expositiones in Ierarchiam coelestem*,<sup>11</sup> where Eriugena intentionally attributes to Dionysius the concept and the word "*creator*," one must, to my mind, translate the passage "*primasque essentias ad esse adducens*" by "he brings the first essences (beings, substances) to existence." For the action of the Eriugenian god proceeds *ex nihilo*, and from this fact, it raises the idea of *origin* (i.e., that of *existence*). The Eriugenian god can no longer be, as was the case for Dionysius, a simple supervisor of the essences since, if one takes into account the narrative of Genesis, it must be recognized as the principle and cause of the radical and total emergence of all beings (intelligible and spatio-corporeal). Thus from the conceptual and operational point of view, the idea of the demiurge becomes inadequate, and parallel with this, essence itself, which in itself is eternal, universal, infinite, and simple, has become powerless to signify the temporal emergence of beings, outside of their cause, into created finitude. It is for this reason that Eriugena summons up the idea of a creator and the concept of existence. "*Divina providentia*" he writes, "*universitatem conditae creaturae ex non existentibus in existentia produxit*,"<sup>12</sup> or again: "*Deus creat igitur omnia quae de nihilo adduxit ut sint ex non esse in esse . . . ita omne quod dicitur existere non in seipso existit sed participatione vere existentis naturae existit*."<sup>13</sup> It is in this "*existential*" sense that one must understand the famous passage of Dionysius for which Eriugena seems to have a marked preference: "*esse omnium est superesse divinitas*."<sup>14</sup> Generally this passage of Dionysius is translated in the following way: "The superessential divinity (i.e., beyond being) is the being of everything."<sup>15</sup> This translation appears to me to give a faithful rendering of the thought of Dionysius; in fact, we know that the demiurge operates at the level of the essences that it establishes. Thus it is in some way anterior and superior to them as principle and as cause, that is, beyond being and eminently unknowable. On the other hand when the same ideas are ascribed to the authorship of Eriugena, it seems to me that there is a danger of misinterpreting his thought. It has not been sufficiently remarked that Eriugena is once again altering the Dionysian text, precisely in the words that immediately precede the passage we are discussing, and it seems thus to be given a new context and a new meaning. We read in the *Expositiones*:

"existentia omnia esse ejus participant."<sup>18</sup> The expression "existentia omnia" leaves no doubt, in my opinion, as to the way in which the "esse omnium" of the preceding phrase is to be understood: it is a question of the very existence of beings, of all the *existents* of whom it must be postulated that they participate in the *esse* of that which is *causa existentis*, since they are not themselves the principle of their own existence. This is my reading of line 132: "Thus all the existents participate in its existence." We are already a long way away from Dionysius. Is it possible then to render the line that follows without taking account of this context? Henceforth the proposition "esse omnium est superesse divinitas" can be understood in this way: "superexisting divinity is the very existence of all existents." Such a translation does more justice, it seems to me, to the constant efforts that Eriugenian thought makes to remain resolutely, in what refers to relations between God and the world, on the level of existents and of existence and not of beings and being (as is the case with Dionysius). This change of perspective once recognized, there could be no meaning, indeed there would even be a contradiction, in translating the "esse omnium est superesse divinitas" by "the superessential divinity is the being of everything," in the eyes of Eriugena. It is a trap that he managed to avoid. For our author, as we know, no essence (divine or created) can know itself or be known; the term "superessentialis" signifies exactly that conviction: "qui dicit superessentialis est, non quid est dicit, sed quid non est."<sup>19</sup> Now to state that superessential divinity (i.e., that of which one knows nothing essential) is the being of everything, is the equivalent, in good logic, of attributing a predicate, thus a determination, to a subject of which one does not know the essence. Here, consequently, is a proposition that, in addition to being contradictory, is far from being enlightening. On the other hand if one says: the superexisting divinity is the existence of everything, one is conveying that there is in God the Creator such an abundance and such a fullness of existence that they overflow onto all the existents of which he is the principle. From this viewpoint, not only does the proposition recover its coherence, but again it makes sense, for it appeals both in its subject (*superesse divinitas*) and in its predicate (*esse omnium*) to significations upon which thought has seized since only the *quia est* of the creatures and of the creator are accessible to it. Existence (*quia est*) is even the immediate datum of the Eriugenian *cogito*,<sup>20</sup> and it is from this first fundamental angle that human thought approaches the knowledge of God: "causa omnium . . . solummodo cognoscitur esse."<sup>21</sup>

Thus one can better understand how, by means of this reversal of viewpoint, Eriugena thought fit in the *De praedestinatione*<sup>22</sup> to invert even the order of the words that belong almost as of right to God, enumerating the verbs before the nouns: "quaedam sunt quasi propria quorum exempla sunt in verbis, quidem sum, es, erat, esse; in nominibus vero essentia, veritas, virtus, sapientia, scientia. . . ." Not only does Eriugena distinguish between the *esse* and the *quod est* in God, but he equally differentiates in him the *quod est* from the *qui est*.<sup>23</sup> These grammatical infrastructures to which Eriugenian thought has reference and from which it takes support, are of such a kind as to dissipate all ambiguity concerning his conception of divinity: being is not an anonymous principle, but is personal, and in relation to

the affirmative discourse which the human mind can conduct on the question, being is pure activity, absolute existence, the cause of existence, indeed even the establisher of the existents. Here is how he defines "creation": "creatio est omnium existentium substitutio;"<sup>24</sup> one can better imagine now the reasons which urged him to prefer the word *creator* to that of "*demiourgos*" and to call upon the concept of *existence* and of *existents* rather than that of the too essentialist *being* and *beings*. It is not without interest to note that each time that Eriugena encounters the expression *ta onta* in the Greek authors, he generally renders it by *existentia* in preference to *entia*. This last term is in fact totally absent from the *Expositiones* and appears only twice in the *DDN* and that within a quotation from Dionysius;<sup>25</sup> on the other hand the word "*existentia*" (the existents) occurs 158 times in the *DDN* and 18 times in the *Expositiones*. These constant alterations express a clear intention on the part of Eriugena which is that of bending the meaning of the word in the direction of his system, and they manifest from this fact that a change is in the course of being produced at the very core of Eriugenian Neoplatonism, of which the keystone has become the *creator*, the supreme existent, the principle and cause of all existence. Consequently, one need not be surprised to see Eriugena modify, for example, the fourfold division of things of Dionysius;<sup>26</sup> while the latter classifies beings into nonliving, living, rational, and intellectual, Eriugena corrects the first category and writes in *existentia*<sup>27</sup>—an interesting correction! It informs us that in his eyes existence is the first step of the universal scale of beings.

## II

We have seen up to now the lexicographical precedence which Eriugena accords to the constellation of the words "*esse*," "*existere*," "*existentia*." It is time to ask oneself what are the metaphysical consequences of this choice—what function and what meaning does he intend to give to the concept of existence? While Eriugenian man understands himself as an existent or knows himself as existing, he gives to existence the role of a fundamental gnosiological principle; to express it in a word—which, though bizarre, you will forgive—I believe that existence has, in the system of Eriugena, the function of an "ousiophany." It is striking to establish the extreme consistency and the close correspondence that exist between the different levels of discourse in the Eriugenian text, so much so that the theologian is in perfect harmony with the metaphysician, the logician, the poet, and the dialectician. Just as the spring that flows<sup>28</sup> appears to the eyes of the poet as an epiphany of what is taking place "in secretis sinibus Naturae", just as creation in its entirety is from the theological viewpoint a theophany, so existence for the metaphysician makes manifest the essence, in the manner in which the accidents (περτοχαι) reveal the substance for the logician, or as the individual, in the dialectical order of genus and species, is in a way found to be the ultimate limit of their revelation.<sup>29</sup> In the *Expositiones*<sup>30</sup> Eriugena tells us that the proper activity of the creator consists in leading the essences to existence: "adduxit eas, videlicet essentias, ad esse," and he adds immediately "ad essentiam plane," that is, that their accession to existence enables what was latent to be made manifest, what was

invisible to be made visible, and what was unknowable to be knowable. In the *De divisione naturae* it is still more explicit: "invenies," says the master to the disciple, "*ousian omnino in omnibus quae sunt, per se ipsam incomprehensibilem non solum sensui sed etiam intellectui esse. Atque ideo ex his veluti circumstantiis suis intelligitur existere, loco dico, quantitate, situ; additur etiam his tempus. Intra haec siquidem, veluti intra quosdam fines circumpositos, essentia cognoscitur circumcludi.*"<sup>31</sup> To exist, consequently, in the mind of our author, is for essence to possess the accidents whose principal mission is to allow the sense or the intellect to grasp not what it is (the *quid*), but at least that it exists (the *quia*). That is to say that the demarcations confirmed through the fact of existence enable essence to be better circumscribed, in some sense to be accounted for, just as the predicates explain the substantive of the proposition—in a word, to allow it to be made visible: "Deus ad visibilem essentiam adduxit."<sup>32</sup>

This "ousiophany" corresponds very exactly to the third mode according to which things are said *esse* and *non esse*. "Quicquid enim ipsarum causarum in materia formata, in temporibus et locis per generationem cognoscitur, quadam humana consuetudine dicitur esse. Quicquid vero adhuc in ipsis naturae sinibus continetur, neque in materia formata, vel loco vel tempore, ceterisque accidentibus apparet, eadem praedicta consuetudine dicitur non esse."<sup>33</sup> In this context of the spatiotemporal generation of things outside of their causes and of their principle (which is called etymologically *ex-sistere*), it is suitable to speak rather of *phusis* than of *ousia*: "nam graeci *phusin* pro *ousia* et *ousian* pro *phusei* saepissime commutant. Horum siquidem nominum proprietas est, *ousian*, i.e., essentiam, de eo quod nec corrumpi, nec minui in omni creatura sive visibili sive intelligibili potest predicari; *phusin* vero, hoc est naturam de generatione essentiae per loca et tempora in aliqua materia, quae et corrumpi et augeri et minui potest, diversisque accidentibus affici. . . . Omnis itaque creatura quantum in suis rationibus subsistit, *ousia* est; in quantum vero in aliqua materia procreatur, *phusis*."<sup>34</sup> Now the fundamental characteristic of every created existing nature is to be generated in time and space: "omnium itaque existentium essentia localis et temporalis est";<sup>35</sup> furthermore, these categories are the two first accidents to be comprehended: "videsne igitur locum tempusque ante omnia quae sunt intelligi?," the master asks the disciple who assents to the idea that time and space constitute in fact the very containers which delimit the essence.<sup>36</sup> As containers, they exercise a necessary gnosiological priority: "Necessario enim ea quae continent prius intelliguntur quam ea quae continentur."<sup>37</sup> As time and space first and then all the other categories contain and delimit the *ens creatum*, so they serve as a necessary mediation to the understanding of the content, that is, of essence, and thus they come to fix as the point of departure in the epistemological path existence itself, preeminent principle of "ousiophany."

### III

This view of things entails grave consequences, of which a first important one consists for Eriugena in conferring (thanks to that "ousiophany" which has just

been mentioned) on existence, on the spatiotemporal and phenomenal realities a preferential gnosiological status. But a second consequence, which is even more spectacular than the first, of which it is moreover the corollary, concerns the metaphysical theory of Eriugena. Postulating as the keystone of totality (the *to pan*) a creating divinity, no longer solely demiurgic but the cause of existence, generator of natures *in loco et tempore*, Eriugena saw himself gradually being constrained to integrate existence into the ontological order as the pole complementary to essence. He expresses his explanation of the subject in connection with his division of the five modes of *esse/non esse* in the opening passages of the *De divisione naturae*. According to the fourth mode, our author reports, "ea solummodo quae solo comprehenduntur intellectu, dicitur vere esse; quae vero per generationem, materiae distensionibus, locorum quoque spatiis temporumque motibus variantur, colliguntur, solvuntur, vere dicuntur non esse, ut sunt omnia corpora quae nasci et corrumpi possunt."<sup>38</sup> One can recognize here the opinion of the philosophers for whom being is identified exclusively with the intelligible. And Eriugena adds: this sense of the word "*esse*" is plausible (*non improbabiler*). It is a judgment filled with deference towards his masters in philosophy, and it is doubtless in order to do justice to them and to make his enumeration more complete that he inserts this fourth mode. But one feels that he does not adhere to this opinion; how could he, without leaving himself open to contradicting the instructions that *reason* itself and the customary manner of speech of human beings have laid down for him on the way in which *esse/non esse* are to be understood—instructions that he passes on to us when speaking of the first and third modes. Of the first he tells us: "ratio suadet omnia quae corporeo sensui vel intelligentiae perceptioni succumbunt, posse rationabiliter dici esse; ea vero quae per excellentiam suae naturae, non solum *uileon* id est omnem sensum sed etiam intellectum rationemque fugiunt, jure videri non esse."<sup>39</sup> *Esse* then signifies to devote oneself to the "prehension," or rather to the comprehension, of the senses or of the intellect, which, it must be emphasized, can happen only at the moment when essence, by definition incomprehensible, is revealed through accidents: "quicquid autem in omni creatura, vel sensu corporeo percipitur, seu intellectu consideratur, nihil aliud est nisi quoddam accidens incomprehensibile per se, ut dictum est, uniuscujusque essentiae."<sup>40</sup> In this context, thought can no longer discount the accidental in order to attain to substance, nor discount existence in order to gain access to essence; the *quid est* presents itself for our recognition under the form of the *quia est*. Essence then is bound up with existence, in a definitive way.

We discover the same concept expressed in the third mode, applied this time to the study of the entire visible universe. Eriugena informs us here that the fact, for the world, of existing in the flesh of the visible, that is, of having been projected outside of its causes (divine or primordial) and of being extended in time and in space, constitutes a supplementary perfection, a completeness: "Tertius modus non incongrue inspicitur in his quibus hujus mundi visibilis plenitudo perficitur."<sup>41</sup> Here then is *ousiophany*: the fact that an essence is placed in spatiotemporal existence and clothed in its accidents confers on it a fullness, a completeness that it did not possess as essence pure and unadorned, withdrawn as it was

from every human perception or intellection. We know that, for Eriugena, that which cannot be understood is in a certain way imperfect in the face of the connatural need of visibility which thought experiences, or, to put the matter differently, that which escapes all epiphany or manifestation does not exist. That is why he will say of God, who is pure infinite essence, outside of time and space, simple, without any accident, that he is *tenebrositas*, positive pure nothingness.<sup>42</sup> In spite of everything he will have lacked in these infinite perfections the complementary and ultimate perfection of revealing himself in his theophanies as supreme Existent and cause of existence, for, deprived of knowing the *quia est*, the human mind could not even guess at the superessential perfections of the *quid est*.

## IV

I hope I may be allowed, in coming to the end of this paper, not to draw conclusions nor to sum what has been said, but rather to express very briefly two general considerations that come to my mind following upon this commentary on the Eriugenian text. First, I want to say that Neoplatonism did not emerge intact or unscathed from its encounter with the Christianity of Eriugena, and neither did his Christianity, but that is another story. Second, the original synthesis that Eriugena succeeded in elaborating with the aid of his precursors represents a decisive turning point in the history of Western ontology. Indeed, if my understanding of Eriugenian thought is correct, it must be recognized henceforth that Eriugena, through the triple primacy that he attributes to existence (lexicographical, gnosiological, and ontological), reversed the order of Neoplatonic values without all the same abandoning them, and was well in advance of Thomas Aquinas and his Arab and Latin predecessors in introducing the concept of existence into the field of Western consciousness.

## 10

## *The Overcoming of the Neoplatonic Triad of Being, Life, and Intellect by Saint Thomas Aquinas*

CORNELIO FABRO

Just as the twelfth century is characterized by the diffusion of Platonism, so the thirteenth century bears the dominant mark of Aristotle, but an Aristotle who remains, even in Saint Thomas Aquinas, present and operative along with Platonic elements put into circulation by Neoplatonism. The commentary on the *De causis* can be considered to be the final step in the process of Saint Thomas' absorption of Neoplatonism. This commentary, which was occasioned by the appearance in the West of Proclus' *Elements of Theology*, constitutes his discharge of a grave intellectual obligation to strike a theoretical balance in regard to all his earlier speculation.<sup>1</sup> Today no further doubt remains that Dionysius the Areopagite also drew heavily on the works of Proclus, if not in fact on the early *Elements of Theology*. Although Saint Thomas himself was unaware of this dependency, he explicates the *De causis* by constant appeal to Proclus, integrates the two, that is, Proclus and the *De causis*, and even corrects them both by using Dionysius.

What we might call "absolute realism," characteristic of the great speculative tradition which begins with Parmenides, achieves its perfect systematic expression in Proclus. We can best realize that this is no accident if we recall that Proclus

has also left important mathematical works. The informing principle of his *Elements of Theology* is the total and direct transformation of relations of formal universality into relations of reality and of causality, and this according to a fabric of relations which intersect one another as infinite lines and centers. What is involved here is a most complete and bold metaphysics of being, one in which "the real cause" is nothing other than the reflection of the logical "Because" and in which the Aristotelian apparatus of genus, species, and difference has been transformed into an objective hierarchy of being and powers.<sup>2</sup> There is thereby developed in the most extravagant form the systematic affirmation of that which we have elsewhere called "coexistence." As Thomas observes:

According to Platonic theory, whatever is found present in many things should be reduced to a first which, by its very essence, is such as that which others are said to be through participation in it. Hence, in this theory, infinite powers are reduced to a first which is by essence Infinity of power—not that it is a participated power found in some subsisting thing, but that it is something which subsists of itself.<sup>3</sup>

Consequently, the classification of the first causes corresponds to grades of universality of the formalities themselves. However, the situation is not very clear in Thomas' exposition, which remains closely bound to the text of the *De causis*. The most obvious scheme is that there is, first of all, the One and the Good, which is followed by *ens* or *esse ipsum* and then by intelligence, life, and finally the world of bodies. On the contrary, between the Good and *esse* there are in fact at least two intermediaries, namely, *aeternitas*, which measures duration, and *infinitas*, which measures *esse*. There is thus an *esse superius aeternitate et ante aeternitatem*, namely, the first cause which is the cause of eternity, just as there is an *esse cum aeternitate*, which is the *intelligentia*, and also an *esse post aeternitatem*, which is the *esse* of the soul and of the corporeal world.<sup>4</sup> Even more, *infinitas* seems to accomplish this function, at least according to Saint Thomas' exposition, that is, an infinity that is situated above *esse* itself. But it is also clear that this first infinity, in turn, participates in the One and the Good that is above it. Ideal infinity is thus the mediator (μεταξύ) between the Good and the entire sphere of being.<sup>5</sup>

Following *infinitas idealis* there is then *ens ideale* or *esse separatum*. The Good is the very first cause, since it extends itself even to "nonbeing," which is matter for the Platonists. *Aeternitas* and *infinitas* are the ideal forms of all the separate forms, but the "separated" *esse* embraces all existing things. Proclus himself wrote with respect to that *esse*: "Omnium participantium divina proprietate et deificatorum primum est et supremum ens."<sup>6</sup> The commentary of Saint Thomas faithfully follows the line of Proclus by setting in relief the intensive emergence of being (*ens*), which is said, from this point of view, to follow immediately after the Good (*Bonum*).<sup>7</sup> Saint Thomas, as has already been noted, gives to the *De causis* an intermediate position between the *esse separatum*, which is the first created ideal form of Proclus, and the *esse participatum communiter in omnibus existentibus* set forth by Dionysius. He thus has the *De causis* assert an *esse participatum in primo gradu entis creati quod est esse superius*, which is therefore the highest

form of created participations and is to be found in the highest sphere of reality.<sup>8</sup> This formal emergence of *esse* involves the most intimate immanence, which is the effect of its closeness to pure *esse* itself.<sup>9</sup> While Saint Thomas interprets this *esse purum* as the first cause itself,<sup>10</sup> the text cited is too vague to authorize so important an identification, one that would break the rhythm characteristic of the Neoplatonic deductions. The difficulty of the question is to determine whether the dialectic of participation has to function with the binary rhythm of Christian creationism, namely, that of *esse per essentiam* and *esse per participationem*, or rather with the ternary rhythm of Proclus, namely, that of the participated, the participations and the things that do the participating. The text of the *De causis* does not provide sufficient support to allow Thomas to detach himself from his source on so decisive a point.<sup>11</sup>

It is not easy to orient oneself in the obscure forest of the Neoplatonic doctrine of "processions" (προόδου), especially that of the first intelligible triad, so as to be able to determine the relations that the first three hypostases have both with the One and also among themselves. For Plotinus the order is as follows: there first comes the One, from which proceeds Intelligence, and from the latter proceeds the Soul, which serves as the intermediary between the Intelligence and matter.<sup>12</sup> The One is also called the First (τὸ πρῶτον) and the Good (τὸ ἀγαθόν) because everything depends on it and everything aspires to it in being, life, and thought. It is also called the Simple (τὸ ἀπλοῦν), the Absolute (τὸ αὐταρχές), and the Infinite (τὸ ἀπειρον). The Intelligence contains the ideas (εἶδη) or pure forms, which are essences (οὐσίαι) and real beings (τὰ ὄντως ὄντα). They are also the intelligibles which compose the intelligible world (κόσμος νοητός) itself. The universal Soul (ἡ ψυχὴ ὅλη), or *Anima mundi* (ψυχὴ τοῦ κόσμου), causes and contains in itself all the particular souls.

The most important point for us is to determine whether the One and the Good is placed at the beginning of the series as the first of three hypostases, or whether it remains in itself separated from every relation with that which proceeds forth. In Porphyry, who declared his fidelity to Plotinus, it seems that the triad does exclude from itself the One, which remains outside it as its very principle. In Proclus, who here interests us more, the procession of the triads is complicated by tortured derivations of a metaphysical arithmetic, one that confronts us with an exasperating formal dreariness. The One and the Good thus seems to be left in its total isolation, while the first triad is arranged according to a structure that repeats itself, at diverse levels, with the same dialectical urgency. In *Platonic Theology*, the fundamental "diremption" seems to be the following: τὸ ὄν, ἡ ζωὴ, ὁ νοῦς that is, being, life, and intelligence, a triad that is said to be found everywhere (πανταχοῦ) according to the principle of πάντα ἐν πᾶσιν. The sphere of being is οὐσία, which comprehends the totality of the intelligibles; νοῦς embraces the sphere of the intelligent principles; and ζωὴ, the sphere of souls as principles of motion in the material world. Corresponding triads are those of πέρας, ἀπειρον, μικτόν, and μονή, πρόοδος, ἐπιστροφή.<sup>13</sup> This ternary rhythm, which unfolds below the One in endless complications, forms the key to the system of Proclus, which in turn inspired the *De causis*.

The context of the fourth proposition of the *De causis*, which sees the reason for the multiplicity of the intelligences in the composition of the finite and infinite, involves the thesis of an *esse separatum* which is not God but which can be called the *esse purum subsistens* because it is the first formality or the "head of the series" in the order of *esse*.<sup>14</sup>

Platonic causality, understood as ideal subsistence, descends from the abstract to the concrete. It falls in straight lines and is divided in parallel cascading. Metaphysical causality and noetic causality always exist here on the same plane and according to a perfect coincidence of relations. Although the principle of separation (χωρισμός) first divides and spreads reality apart into a fabric of scaled participations, it then unifies and constrains it with an iron structure of relations of necessary inclusion. Saint Thomas finds in Proclus' metaphysics of identity a logical and continuous development of the principles of Plato. In a word, the order of causality is symmetrical to that of universality:

Among these forms, however, he introduced this order: that to the degree that a certain form is more universal, to this degree it is more simple and prior as a cause, for it is participated in by posterior forms. It is just as if we were to say that animal is participated in by man, and life by animal, and so on for the other forms. The ultimate, in which all else participates and which does not itself participate in anything else, is the One itself, the separate Good which he said was the supreme God and the first cause of all things. Hence the following proposition, proposition 116, is introduced in Proclus' book: "Every god is capable of participating, . . . except the One."<sup>15</sup>

Since the intellects know only through participation in the intelligibles, the intellects follow the intelligibles in both the real and causal orders. But in his commentary—why I don't know—Thomas makes the intelligent beings to be the separate forms or pure formal unities (ἐνσώματα) of Proclus.<sup>16</sup> In any case, the causal derivation is divided according to Saint Thomas in two intentional currents, so to speak, one that is metaphysical and another that is noetic. For the soul, too, there is a participation of divinity, not through the direct communication of the ideal intellect but by means of the divine intellects. Bodies themselves, in their turn, participate in the divine by way of the divine souls.<sup>17</sup> The latter are the first divine hypostases (or "heads of the series") that constitute the source of causal derivation in their own genus and in subalternated genera.<sup>18</sup> Accordingly, the noble soul (*anima nobilis*), which presides over the whole corporeal world, has a double operation: (1) a divine operation insofar as it is a principle of movement for the whole of nature, and (2) the operation of understanding things. There is also a double participation, and therefore a double causality and a double dependence.<sup>19</sup>

Saint Thomas recognizes that in this doctrine of a descending, scaled causality there may lie hidden a grave danger for Christian creationism. However, he not only absolves the author of the *De causis* of all error, but he even appeals to the Platonists themselves, who conceived derived causalities according to the mode of participation and not of creation. The causality of the formalities following upon *esse* would therefore be of a complementary nature and not of a creative or

constitutive nature. The key to the turn which Thomas' commentary has taken here is the presupposition already mentioned, that is, that for the *De causis*—and here Saint Thomas extends this presupposition to the Platonists—*esse separatum* is God, the creator of the being of all things.<sup>20</sup> The mitigation which the *De causis* would introduce into the rigid Neoplatonic doctrines of vertical causality is formulated by Saint Thomas in proposition XVIII (XVII), which truly represents the nucleus of the Thomistic metaphysics of causality. It is that God, the First Being, gives being to all other things by means of creation (*ens primum . . . dat esse omnibus . . . per modum creationis*), while the other hypostases, namely, life (*vita*) and intelligence (*intelligentia*), give that which they give not through the mode of creation (*per modum creationis*) but through the mode of a form (*per modum formae*).<sup>21</sup> In his commentary on this proposition, Saint Thomas leaves the defense of this graduated or scaled creative causality to the Platonists, but he absolves of all blame the *De causis*, which here becomes allied with Dionysius—he had set up a like alliance for its position regarding the separate forms in God. It thus remains—and this is the important result for this dialectic—that there are two modes of causality, one by way of creating (which relates to *esse*), and the other by way of an informing (which relates to the other formalities).<sup>22</sup>

We already know the decisive application that Saint Thomas makes here of the notion of intensive *esse*:

Because therefore thinking (*intelligere*) presupposes living and living presupposes being (*esse*) and being does not presuppose anything else prior to it, so it is that the first being (*ens*) "gives being (*esse*) to all things by means of creation." But "first life," whatever this may be, gives life not by means of creation but after the manner of a form, that is, by forming. And a similar account is to be given of intelligence.<sup>23</sup>

Indeed, Saint Thomas is persuaded that the *De causis* corrects itself at this point:

From which it is clear that when he said above that intelligence was the cause of soul, he did not understand this to mean that it was a creative cause, but merely that it was a cause by way of informing.<sup>24</sup>

The meaning of the formulae of the *De causis* now seems beyond discussion: the superior intelligences cause the inferior, and the inferior intelligences in turn cause the souls.<sup>25</sup> Saint Thomas' open recognition of this is very significant with respect to what can be called the theoretical tension internal to Thomism. Nevertheless, the only causality that can be attributed to separate substances, that is, the intelligences and angels, in regard to inferior substances is one of a dispositive nature. However, it is not possible to state that causality any more precisely. The *De causis* remains, then, faithful on this fundamental point to its Neoplatonic source.<sup>26</sup>

The incomplete treatise *De substantiis separatis* seems to represent Thomas' final stance towards Platonism, that is, Neoplatonism. Since the exposition is free and not tied to a text, it proceeds (as it seems) with a greater synthetic and critical power. It also constitutes the last word of the Angelic Doctor on these, the most difficult problems of metaphysics. We shall therefore briefly analyze its basic structure and salient doctrines.

A. The first chapter, which concerns the ancient philosophers (*De opinionibus antiquorum philosophorum*),<sup>27</sup> is mostly of a historical introductory nature. Four principal stages are indicated in the demonstration of the existence of spiritual substances: (1) the first philosophers, who were still ignorant of the nature of spirit; (2) Anaxagoras, who introduces the intellect only as a distinguishing principle of the cosmos; (3) Plato and the "Platonists"; and (4) Aristotle. If, for the first two stages, Saint Thomas still relies on the exposition of Aristotle, he enlarges his perspective in regard to Platonism and follows the new sources that he has now come to know. For the first time, the Platonic method of separation to attain the *veritas fixa* of the separate universals is directly related to the method of intellectual abstraction. This method is itself divided into two branches, namely, mathematical abstraction and physical abstraction.<sup>28</sup> According to Saint Thomas, Plato had envisaged two spheres of formal, separate beings, namely, that of mathematics and that of abstract universals, which he called *species* or *ideas*. However, an important difference is to be noted between the two spheres. While in the sphere of mathematical abstraction one can think of many individuals of the same species (for example, two equal lines or two equilateral triangles), in the sphere of abstraction of universals this is not possible. For example, man taken in his universality is only one in species. For this reason, Thomas explains, Plato placed the sphere of mathematical relations as intermediate between the species or separate ideas and the singular sensibles. Insofar as there can be many individuals of the same species in the mathematical sphere, that sphere bears a likeness to sensible singulars; insofar as the relations are abstract, it bears a likeness to the universals.

B. There then follows an analytical description of a metaphysical structure of the world that is still attributed to Plato, but which in reality gathers together the development of Neoplatonism as it can be found, for example, in Proclus. That structure consists of the triad of the *unparticipated*, the *things which are participated in* or *participations*, and those *things which participate*.

**1. The general principle and doctrine of the subsistent One.** The direct correspondence between the logical and the real orders fixes the primacy of the One and the Good:

Further, among forms themselves, he posited a certain order, on the ground that according as something was simpler in the intellect, so far was it prior within the order of things. Now that which is first in the intellect is the One and the Good: for he understands nothing who does not understand something one and good, and the one and the good follow upon one another. Hence Plato held that the first Idea of the One, which he called the One-in-itself and the Good-in-itself, was the first principle of things and this Idea he said was the highest God.<sup>29</sup>

Up to this point there is nothing new in comparison with the commentary on the *De causis*. However, what follows regarding the classification of the secondary unities, of the separate intellects, and of the souls reveals a greater penetration and adherence to the text of Proclus than that found in Thomas' commentary on the *De causis*. The fidelity to Proclus, even if not complete, is more visible.

## 2. The separate derived unities and the second gods:

Under this One, he established among the substances separate from matter, diverse orders of participating and participated beings, all of which orders he called secondary gods, as being certain secondary unities below the first simple unity.

There is a descending nexus of causality:

Again, inasmuch as all forms participate in the One, the intellect likewise must participate in the forms of things in order to have understanding. Therefore, just as under the highest God, who is the prime unity, simple and unparticipated, other forms of things exist as secondary unities and gods,<sup>30</sup> so, under the order of these forms or unities, he posited an order of separate intellects, which participate in the above-mentioned forms in order to have actual understanding. Among these intellects, an intellect is higher according as it is nearer to the first intellect<sup>31</sup> which has full participation in the forms; just as among the gods or unities, that one is higher which shares more perfectly in the first unity.

A higher mode of cognition is attributed to the second gods (or "participations"):

Although Plato distinguished between the gods and the intellects, he did not mean to imply that the gods could not have understanding. It was his desire, rather, that they should understand in a supra-intellectual manner: that is, instead of understanding by participating in certain forms, they should have understanding through themselves, with the proviso that every one of them was good and one only through participating in the first One and Good.<sup>32</sup>

Why does Saint Thomas not also apply this extension to the first One and to the Good? For the reason that he had already noticed, namely, that knowing for Platonism is inferior to the incommunicable reality of the First. Analogously, if the second unities or gods or separate forms understood, they would also participate in the intelligibles, and the intelligibles would no longer be the foundation of the participation in understanding on the part of the intellects.

## 3. The hierarchy of souls:

Again, because we see that certain souls possess understanding which, however, does not befit a soul by the fact that it is a soul, otherwise it would follow that every soul is an intellect and that it would be intelligent in its whole nature, he further posited that under the order of the separate intellects, there was an order of souls, the nobler of which participate in intellectual power, while the lowest of them are lacking in it.

The dignity of souls in the cosmic function is assigned to them with respect to bodies:

Again, because bodies do not seem to be capable of moving themselves, . . . , Plato held that self-motion belongs to bodies insofar as they participate in soul, since those bodies lacking in this participation, are not moved, unless they are moved by an-

other. Whence he considered it to be an essential property of souls that they move themselves.<sup>33</sup>

**4. The hierarchy of bodies.** A novelty of this classification is the aerial bodies or ethereal bodies of demons of which Apuleius speaks. It is a question of a body internal to the soul, invisible and perpetual as the soul itself.<sup>34</sup> And just as among men there are the good and the bad, so too are demons divided into the good and the bad. There are thus four orders of intermediate beings between us men and the supreme God. Below the One there are the second gods, the separate intellects, the celestial souls, and the good and bad demons.

**5. The derivation of beings.** The immediate creation of *esse* by God and the mediate production of the sphere of the real:

Influenced by these reasons, the Platonists held that in the case of all immaterial substances and, in general, all existing things, God is immediately the cause of being according to the aforementioned mode of production which is without change or motion. But they posited a certain order of causality in the aforementioned substances according to other participations in the divine goodness.<sup>35</sup>

The participations of the concrete are directly related to the subsistent universals of the respective formalities as, for example, man will participate in bipedness and animality.<sup>36</sup> Turning a bit further on to explain the division of spiritual substances, Saint Thomas, again citing the Platonists, mentions by name Plotinus (from Book IX of Saint Augustine's *City of God*), and he closes his exposition with a citation from the *Elements of Theology* of Proclus himself.<sup>37</sup>

Platonic causality is actuated as a participation that is the "presence" of the cause in the thing caused. Causality shows itself to be a defense and a recovery of the unity of the real insofar as the multiplicity of the effects is gathered into the unity of the cause. In turn, that cause has value—as cause—precisely insofar as it is a unifying principle in its own undivided immobile reality. In this way, causality becomes the verification and systematic foundation of the Parmenidean unity of the real. The complex causal hierarchies, which were devised by Neoplatonism and systematized by Proclus, actuate this program of unification which in Plato had remained suspended and dispersed in formal multiplicities. These latter multiplicities were set next to the One and each of them was placed one next to the other but without any clear and effective relation of dependence among them. Moreover, the relation between the ideal Platonic form and the sensible participants was a relation of "similitude," and this relation was equally affirmed for all the various relations that ran between the world of Ideas and that of reality. As a result, the abyss of separation between the intelligible world and the sensible world was left intact, and the world of ideal reality was contained in itself as an autocratic collection of pure Ideas, uncontaminated by sensible reality, which is itself subject to the vicissitudes of time according to the rhythm of generation and corruption.

Neoplatonism steadfastly maintains itself in this perspective of an "absolute realism" which makes the Good and the One to precede *esse* and places it outside

God. However, having been made more self-conscious by Aristotle's critique of *chorismos*, Neoplatonism thought to fill up the abyss of separation by the theory of the hypostases or higher unities. Consequently, while the *transcendence* of the ideal forms represents the first moment of the truth of being, the *immanence* of the same forms is the equally necessary second moment. Indeed, Platonic causality is resolved in this second moment of immanence. It is not so much a matter of explaining the "becoming" of reality—since the world itself stands before us and we ourselves are continually subject to its changes—it is, rather, a matter of individuating that which everywhere in the respective natures is always that which it is, and of discovering it in the form of an immutable presence. In this way, the reality of our experience does not properly exist in virtue of that which it is, but it exists, rather, thanks to that which it is *not*. That is to say, the real that we experience exists by means of that higher formality that maintains and penetrates everything with its power.

Saint Thomas brilliantly grasped the Neoplatonic innovation and his commentary on the *De causis* is the continuous explicit confirmation of it. The difficult point for all of this speculation lies in the divergence that remains between the formal unification of the real in itself and the concrete unity of the real of our experience. While Platonism opted for formal unity and lost real unity, Aristotelianism, on the other hand, opted for real unity but lost formal unity, or at least it reduced that formal unity to a universal in the human mind. In neither of the two do we reach the unification of the real in a supreme unity coeternal with God.<sup>38</sup> In this regard, the diversity of formulations that immediately leaps to the eye (both at the beginning and also in the very structure of the work of Proclus and of the *De causis*) is symptomatic.<sup>39</sup> With a perfect Platonic orthodoxy, the *Elements* opens with a prologue that treats of the One and of the Many (propositions 1–6), which is of course the central problem of Plato's *Parmenides*.<sup>40</sup> Such a prologue is missing in the *De causis*, and it would seem that nowhere in his commentary does Saint Thomas expressly follow any of these first propositions of the *Elements*. On the other hand, the *De causis* immediately begins in proposition 1 with the universal theory of causality which sums up the whole doctrine of the treatise and constitutes the motto that made it so famous in the Middle Ages: "Every primary cause has more influence over what it causes than does the secondary universal cause" (*Omnis causa primaria plus est influens super causatum suum quam causa universalis secunda*).<sup>41</sup> The universal theorem of dependence is later completed with propositions IX (VIII), XVI (XV), XVIII (XVII), XIX (XVIII), and XXII (XXI), and it is Saint Thomas himself who relates these aphorisms to one another. As to the commentary connected to the text, which seems to be by another author, possible Arab and also unknown, while it is on a noteworthy speculative level, it often leaves Thomas perplexed, and he prefers to concentrate on the text of Proclus himself.

The commentary of Saint Thomas on the *De causis* has a well-defined character. It aims to demonstrate the absolute dominion of God, the First Cause, and his unity insofar as he is the *ipsum esse subsistens*, and to do so according to the reduction of intensive *esse* proposed by Dionysius.<sup>42</sup> The fundamental agreement

of the doctrines of the *De causis* with those of Proclus is beyond discussion, and the Dionysian turn effected by Saint Thomas in his commentary concerns his own synthesis and transcends his interpretation of the text. This comes to light right from the first proposition. Where the *De causis* says: "Omnis causa primaria plus est influens . . . quam causa universalis secunda," Saint Thomas begins his own commentary by writing simply, that is, without adding anything else: "Cause prima plus influit in effectum quam causa secunda." The subject of the *De causis*, "omnis causa primaria," evidently stands for the plural because there are many primary causes in Neoplatonism, that is, all the primary forms or unities (ἐνότητες); every head of a series in the formal order, as we have seen, can be called "causa universalis primaria."<sup>43</sup> However, let us now turn to Thomas' commentary on the doctrinal content of this prologue, which he divides into a corollary and a conclusion: both of these points are taken from propositions 56 and 57 of Proclus' *Elements of Theology*.

The example adduced as the first argument (*esse, vivum, homo . . .*) proceeds by reference to the formal causes, and in this consists the Neoplatonic method of establishing a direct relation between real principles and formal reasons: ". . . in quibus quanto forma est universalior, tanto prior esse videtur." However, in Thomas' interpretation of the example, the transcendental Platonic causality suddenly undergoes an explicit Aristotelian twist by means of the theory of substantial change. The principle that in formal causes: "quanto forma est universalior, tanto prior esse videtur . . ." holds for the three indicated formalities: *homo* indicates the specific form, *vivum vel animal* refers to the *forma generis*, and *esse* signifies *id quod est omnibus commune*. In the processes of generation and corruption, the more universal formality reveals itself as the more fundamental and primitive: in generation, *esse* is delineated first, then *animal*, and then *homo*, while in corruption, *homo* is lost first (that is, the use of reason!), then "*vita . . . et remanet ipsum ens quod non corrumpitur*."<sup>44</sup>

In the exposition that follows, Saint Thomas prefers Proclus to the *De causis*. For Proclus, the First Cause has greater influence because it is the cause of the very operation with which the second cause causes the effect and it is therefore of help to the second cause. For the *De causis*, however, reason, which is the second cause, is the effect of the First Cause. Indeed, the First Cause is cause of the very substance of the second cause, because the operative power itself of the second cause originates from the First Cause. Such being the case, it is not simply a matter of helping the second cause, but of establishing the very causality to be found in that cause:

Therefore, that the second cause is the cause of an effect is something it has from the First Cause. Therefore, to be the cause of an effect belongs primarily to the First Cause, secondarily to the second cause. But what is prior among all things is more greatly [to a greater degree], since the more perfect are prior in nature. Therefore the First Cause is the cause of an effect to a greater degree than is the second cause.<sup>45</sup>

Since the influence of the First Cause is, first of all, the most intense, it is therefore the most profound in its efficacy and the most universal in its extension.

In the second place, the First Cause is the last to abandon the object, "tardius recedit": here the felicitous expression of the *De causis*, which speaks of a "greater vehemence"<sup>46</sup> of the influence of the First Cause on the effect of the second cause, holds for a while the attention of Saint Thomas.

However, the demonstration of the third point, ". . . quia prius advenit," turns immediately to the two propositions cited from Proclus and extends in an Aristotelian manner the verification of the principle to the other kinds of causality, namely, material and efficient causality. Neither Proclus nor the *De causis* had of course thought of doing this. Thomas argues this for efficient causes in the following fashion:

For it is evident that the more an efficient cause is prior, the more does its power extend to many things. Hence its proper effect should be more common. Indeed the proper effect of the second cause is found in fewer things and hence is more particular. For the First Cause itself produces or moves the second efficient cause, and hence is a cause of its acting.<sup>47</sup>

In these resolute remarks is condensed the entire doctrine of transcendental causality which, in Platonism, issues from and absorbs into itself the whole cycle of causality.

Finally, the First Cause—the term itself indicates this—precedes in activity the second cause: "prius advenit . . ." No one could state more explicitly the triumph over Aristotelian immanence, which attributes to form, itself tied to matter, priority in being and activity. But in his entire commentary Saint Thomas always avoids this direct confrontation, which is still premature. He gets around the obstacle in a very skillful fashion in that the primacy which had been attributed to formal causes is now conceded to efficient causes. To justify turning things upside down Thomas does not invoke Aristotle, as we might have expected, but he again cites Proclus:

Therefore the three above-mentioned aspects which have been touched upon [the first cause "has greater influence . . . , leaves later, arrives earlier"] are found primordially in efficient causes and from this it is clear that the derivation goes out toward formal causes. Hence the word "to influence" ["to flow into"] is used here and Proclus uses the word "production"<sup>48</sup> which expresses the causality of an efficient cause.<sup>49</sup>

This change of front is of great importance for Saint Thomas in that, if we can take our departure from efficient causes as the prime analogate (*princeps analogatum*) of causes, we can also arrive at demonstrating the creation of prime matter. This demonstration is in fact one of the principal objectives of Thomas' commentary. No one can fail to notice that the direct creation of matter by God signifies creation itself and the total dependence of all being on God. The doctrine is here introduced by the analogy of the artisan who takes hold of the matter of nature. And so God, the first and supreme artisan, must be the creator of nature itself and therefore also of matter:

The First Cause of all things is compared to the whole of nature, just as nature is compared to art. Hence that which first subsists in all of nature is from the First Cause of all things and is particularized in each individual by the work of second causes.<sup>50</sup>

The final application of the proposition in its three moments holds good for the order of final causes: this too is an extension of obvious Aristotelian inspiration, but it presents us with the unexpected reduction of the final cause to the efficient cause:

For it is for the sake of the ultimate end, which is universal, that other ends are sought, the desire for which comes after the desire of the ultimate end and which ceases before it. But the essence (*ratio*) of this order [of cause] is reduced to the genus of efficient cause, for the end is cause insofar as it moves an efficient cause to act, and thus, insofar as it has the nature of that which moves, it belongs in some way to the genus of efficient cause.<sup>21</sup>

It is clear that this process of reducing the second causes to the First Cause is applied within the sphere of direct *per se* subordination and it is not effected through that *per accidens* subordination that lacks all rule or restraint. And so through his radical reflection on principle taken as act, Aquinas has overcome the static and circular dialectic of the Platonic triads (ὄν, ζωή, νοῦς) in such fashion as to make *esse ipsum* emerge as the constitutive metaphysics of God and also to make participated *esse* (*actus essendi*) emerge as the act of all acts and the perfection of all perfections.

## *The Problem of the Reality and Multiplicity of Divine Ideas in Christian Neoplatonism*

W. NORRIS CLARKE

My purpose in this paper is to trace a chapter in the history of ideas within the broad stream of Neoplatonism as it passes into Christian thought. The theme is one that caused special difficulties to Christian thinkers as they tried to adapt the old wine of Neoplatonic metaphysics to the new wineskins of Christian theism. My intention is not to focus in detail on just what each thinker involved held, as a matter primarily of historical scholarship. My interest will rather be focused primarily on the basic philosophical problem itself, and on tracing out the general types of solutions tried out by various key thinkers along the line from Plato to Saint Thomas. The problem is this: For Plato and all pre-Christian Platonists the world of ideas was "the really real"; hence, the multiplicity of the ideas and their mutual distinctions were also real, though in the mutual togetherness proper to all spiritual reality. Such multiplicity, however, was not admitted into the highest Principle, the supreme One, who by nature had to be absolutely simple to be absolutely one. But the Christian God, as personally knowing and loving all creatures and exercising providence over every individual, had to contain this world of archetypal ideas within his own mind, in the Logos. Yet the real being

of God was also held to be infinite and simple; the only real multiplicity allowed within it was that of the relational distinction of the three Persons: Father, Son, and Holy Spirit. How would it be possible to put all these doctrines together without internal contradiction in a consistent doctrine of God? The story of the various efforts to meet the problem is a fascinating and illuminating study in the history of ideas. Let us retrace the principle moments in it.

## PLATO

For Plato himself it is clear that the world of ideas possesses a strong dose of reality. The breakthrough to discover the abiding presence of this transcendent dimension of reality, for the first time in the history of Western thought, must have been a powerful, almost intoxicating, experience for him, as though a veil had been pulled aside to reveal at last the splendor of the truly real, in comparison with which our changing world of sensible objects was only a shadowlike imperfect image. No modern neo-Kantian or analytic philosophy reinterpretation of the theory of ideas as merely conceptual or linguistic categories should be allowed to vitiate the strength of Plato's ontological commitment to the objective reality of ideas, however this be finally interpreted.<sup>1</sup> But when we come to the relation between the world of ideas and the mind as knowing them, clouds of ambiguity begin to thicken. *Where* are the ideas? What is their ontological "location" or ground? Do they constitute an independent dimension of reality on their own, whose autonomous light is then passively received by any mind knowing them? Or do they reside in some ultimate mind that supports them by always thinking about them?

With respect to the human mind it is clear that the world of ideas constitutes a realm that is ontologically quite independent of our minds. We do not just make them up; our knowledge is true because they are there. The matter is more obscure when we come to the demiurge of the *Timaeus*. No direct statement is made; but the images used suggest that the demiurge, in order to create an ordered cosmos, contemplates and copies an objective world of ideas that is already given even for him; it is the natural object of his contemplation, as it is for all the gods and unfallen souls who drive their chariots across the eternal heaven of ideas, but it is not something they think up or produce out of their own substance but which they gaze on as already given. Contemplation, the highest act of any Platonic mind, is a motionless reception, not a productive act.<sup>2</sup>

This leaves the ultimate status and ground of the world of ideas veiled in obscurity for Plato. The sparsely adumbrated doctrine of the One and the Good as the ultimate source for both ideas and minds does significantly complete the picture. But it is never made clear whether the Good is a mind or something above it, whatever that might mean. There are indeed highly significant hints in the *Timaeus* and the *Sophist* that the whole world of ideas is part of a single great living unity. But the generation of the world of ideas by the Good, even if conceived as ultimate mind, which Plato never calls it, is quite compatible with the objective reality and the multiplicity of this world as the really real. In any case,

the ultimate relation between the world of ideas and mind remains unfinished business in Plato, a legacy for his successors to unravel.

## PLOTINUS

When we come to Plotinus—I will pass over the intermediate preparatory stages of Middle Platonism—a major resolution of the problem has been achieved, but with serious internal tensions still remaining. On the one hand, the ideas are now firmly located ontologically within the divine *Nous*; they no longer float in ambiguous ontological independence, but are eternally thought by this eternal mind as its connatural object. As a result the ideas themselves, though immutable, immaterial, and eternal, are alive with the very life of the divine Mind itself, each one a unique, self-thinking, spiritual perspective on the whole of reality.

On the other hand, there still remains a strong dose of the old Platonic realism of ideas, and this creates a tension between two somewhat conflicting perspectives on the status of the ideas in Plotinus—a tension that it does not seem to me that he completely resolves. This tension concerns the relation of priority between the *Nous* and the ideas: Is the *Nous* absolutely prior in nature (not, of course, in time) to the ideas, the realm of authentic being, as generative act to its product? Or do the ideas have a certain priority over the *Nous* as the true existence over the act that contemplates it? Or is there simultaneous reciprocal dependence, inherence, or even identity without any priority at all?

We would be tempted at first, viewing the problem from within the central dynamic perspective of the descending flow of emanation from the One, to assert that obviously the *Nous* (or Intellectual Principle) has priority over the realm of being or ideas, as their generating source. As the *Nous*, emanating from the One, turns back toward the One in its first ontological "moment," as an empty and formless ocean of potentiality, it is fecundated, so to speak, by its contemplation of the splendor of the One and bursts forth into producing the whole multiple world of ideas in atemporal ordered sequence (corresponding to the inner order of the intelligible numbers, one, two, . . .).<sup>3</sup> This dynamic perspective is certainly present in Plotinus, but surfaces only occasionally and briefly. I might add, speaking in my own name as philosopher, that in this direction lies, it seems to me, the only satisfactory metaphysical explanation of the relation between mind and ideas: the absolute priority of mind, as ultimate spiritual agent, over all ideas; existential act must always precede idea. This perspective gradually became dominant in Neoplatonism, both Christian and Islamic, after Plotinus, and in most modern thought. But it is still a minor chord in Plotinus himself.

There is another and more prominent perspective in Plotinus, however, which runs through the whole gamut of his works, both early and late; here the old Platonic priority of being over intelligence still stubbornly holds on and is never explicitly negated by Plotinus. This can be found especially in *Ennead* V, 9, "The Intellectual Principle, the Ideas, and the Authentic Existent," a very early treatise (no. 5) in chronological order. The first point developed here is that the ideas cannot be out-

side the Intellectual Principle, otherwise its truth would be insecure and its knowledge imperfect. The ideas must thus be part of the very self of the *Nous*, identical with its being as a single unitary life flowing through all the distinct parts. But Plotinus goes on to say more, giving a certain priority to the ideas over the *Nous* as thinking principle, so that they seem to constitute the very life of the *Nous* itself.

Being true knowledge, it actually is everything of which it takes cognizance; it carries as its own content the intellectual act and the intellectual object since it carries the Intellectual Principle which actually is the Primals and is always self-present and is in its nature an Act . . . but always self-gathered, the very Being of the collective total, not an extern creating things by the act of knowing them. Not by its thinking God does God come to be; not by its thinking Movement does movement arise. Hence it is an error to call the Ideas intellections in the sense that, upon an intellectual act in this Principle, one such idea or another is made to exist or exists. No: the object of this intellection must exist before the intellectual act (must be the very content not the creation of the Intellectual Principle). How else could this Principle come to know it. . . .

If the Intellectual Principle were envisaged as preceding Being, it would at once become a Principle whose expression, its intellectual Act, achieves and engenders the Beings; but, since we are compelled to think of existence as preceding that which knows it, we can but think that the Beings are the actual content of the knowing principle and that the very act, the intellection, is inherent to the Beings, as fire stands equipped from the beginning with fire-act; in this conception the Beings contain the Intellectual Principle as one and the same with themselves, as their own activity. But Being is itself an activity: there is one activity, then, in both or, rather, both are one thing.<sup>4</sup>

The above presents a significantly different perspective: here the inner being and act of the ideas seems to constitute the very act of the *Nous* itself, rather than the *Nous* giving them its own being by actively thinking them up. The older Platonic conception of mind, here faithfully reproduced, seems to be that mind as such, even the divine Mind, is by nature contemplative, not constitutive, of its object. This position, however, leaves open the difficulty we saw earlier in Plato, that is, what is the ultimate ground for the unified multiplicity of the world of ideas? It seems to be an exigency for intelligibility that only the active power of a unitary mind can ground both the multiple reality of the ideas and their mutual correlation into a single unified system. That is why the later more dynamic perspective in Plotinus, that of the *Nous* as generative of the world of ideas, is more metaphysically satisfying, and is the one that actually dominated in the subsequent history of Neoplatonism.

Even though priority is occasionally given to *Nous* over the ideas, the strong realism of the ideas still remains undimmed in Plotinus. And it is this that forbids allowing the world of ideas to be in the One. Since the ideas are really real, true being, and really multiple or distinct, and the One as pure unity cannot tolerate the slightest shadow of multiplicity within itself, even that between mind and idea, the

entire world of ideas or true being must be relegated to a lower level of divinity, the second hypostasis or *Nous*.<sup>5</sup>

### THE EARLY CHRISTIAN FATHERS

When the first philosophically minded and trained Christian thinkers took over the Neoplatonic philosophical framework to use in the intellectual explication of their faith, during the third and fourth centuries, they had to make two drastic changes in the matter which concerns us. First, the subordinationist hierarchy of divine hypostases in Plotinus had to be condensed into a single supreme divine principle, in which the three Persons within the divine nature were perfectly coequal in perfection of being, distinguished only by internal relations of origin, not by differing levels of perfection. Thus the Word or Logos, the Second Person, corresponding analogously to Plotinus' *Nous*, was declared perfectly coequal with the Father (corresponding analogously to Plotinus' One) sharing the identical divine nature and perfection. Secondly, the single supreme God of the Christians was identically creator of the universe through knowledge and free act of love, and exercised personal providence over each and every individual creature. This required that the one divine Mind, the same for all three Persons but attributed by special aptness to the Word or Logos, contain the distinct knowledge of every creature as well as the universal archetypal ideal patterns guiding the creation of the world according to reason. The old Platonic and Neoplatonic world of ideas, enriched with the distinct knowledge of individuals, is now incorporated directly into the one supreme divine nature itself. Christian thinkers simply had to do this to do justice to their own revelation, and they had no hesitation, but rather took pride, in doing so.

The metaphysical repercussions, however, of making the above changes in Neoplatonic tradition were of seismic proportions, and did not seem to be recognized very clearly for some time in their full philosophical implications. Two basic Neoplatonic axioms have now been violated. First, knowing a distinct multiplicity of objects, even only as ideas, is no longer considered an inferior mode of being, weakening and compromising the radical purity of unqualified unity and simplicity in the One. To know multiplicity is no longer a weakness, but a positive perfection, part of the glory, of a One that is *personal*. To *know* multiplicity is not to *become* multiple oneself. Secondly, purely relational multiplicity even within the real being or nature of the One is no longer a compromise or destruction of its unity, but an enrichment. The highest form of unity is now not aloneness but communion of Persons with one mind and will. We are not concerned here with this second principle, relational multiplicity within the nature of the One. Our concern is limited to the status of the world of ideas within the divine Mind.

It was one thing for Christian thinkers to *assert* that the world of ideas must be within the divine Mind as Logos, in order that God may personally know and love his creatures. But it is another thing to come to grips successfully with the metaphysical problems involved in thus adapting the Neoplatonic doctrine of the

world of ideas. In particular, what about the strong realism of ideas as true being, the really real, which was so deeply ingrained in the whole Platonic tradition, no less, in fact even more, in Plotinus than in Plato himself? If the ideas remain, as always in this tradition, true and real being, they must also be really multiple. Does this not introduce an immense multiplicity of real beings, an immense real pluralism, within the very being of God himself, thus negating his infinite simplicity? In orthodox Christian doctrine, as it was gradually worked out, the only distinct realities allowed in God were relations, and the only real relations allowed were relations of origin resulting in the three Persons. But if all the divine ideas are also authentic, hence, real being, and at the same time distinct from each other in the intelligible (real) order, then there is not only a multiplicity of distinct real beings within God himself but a still greater multiplicity of real relations between them. For the relations between ideas are clearly distinctly intelligible, and for every traditional Platonist whatever is intelligible is also real.<sup>6</sup>

It is not clear to me that the Greek Fathers ever came to grips explicitly with this metaphysical problem of the reality of the divine ideas in God, aside from asserting that God knew them all with a single act of knowledge, which Plotinus would also admit. (I would be very happy to receive any information from my colleagues on this point, since patristics is not my field and I have not had the time in preparing this paper to do extensive study on this point.) My general impression is that we will have to wait till a later period to find explicit metaphysical discussion on this point.

Let us turn briefly to Saint Augustine in the West, as a prime example, it seems to me, of avoiding the issue. He holds simultaneously two metaphysical doctrines that I do not see that he has brought together in a consistent whole. On the one hand, one of his central doctrines, learned, as he tells us, from the Platonists, is that of divine exemplarism, namely, that the divine Mind contains the ideal exemplars, the *rationes aeternae*, of all created things, according to which he creates them by willing them to be, to be *expressed*, outside of himself as real creatures, as real *essentiae*.<sup>7</sup> It should be noted along the way that Augustine is careful not to call the divine ideas *essentiae aeternae*, the eternal essences of things, but only *rationes aeternae*—eternal “reasons” or exemplary ideas, models. Since the concrete term *ens*, *entia* did not yet exist in Latin in Augustine’s time—it was introduced deliberately by Boethius centuries later—*essentia* was the standard noun derivative from the verb *esse* used in Augustine’s time for referring to existential being.<sup>8</sup> Hence, on the one hand, one might be led to believe that these *rationes aeternae* were not considered by Augustine to be a realm of true being, in God, since the entire universe of real being was created in time freely, not from all eternity, as these *rationes* necessarily existed in the mind of God.

On the other hand, when Augustine comes to an explicit discussion and definition of what it means to be—to be a being—his criterion of true being is quite unambiguously the old Platonic one of immutability; to be is to be *immutable*, to be identically and immutably *what* one is. His texts could hardly be more forceful:

There is only one immutable substance or essence, which is God, to which being itself (*ipsum esse*), from which essence draws its name, belongs supremely and in all truth. For that which changes does not keep its very being, and that which is capable of changing, even if it does not change, is capable of not being what it was. There only remains, therefore, that which not only does not change but is even absolutely incapable of changing which we can truthfully and honestly speak of as a being.<sup>9</sup>

Being (*esse*) is the name for immutability (*incommutabilitatis*). For all that changes ceases to be what it was and begins to be what it was not. True being, authentic being, genuine being is not possessed save by that which does not change.<sup>10</sup>

Being (*esse*) refers to that which abides. Hence that which is said to be in the supreme and maximal way is so called because of its perdurance in itself.<sup>11</sup>

All change makes not to be what once was; therefore he truly is who is without change.<sup>12</sup>

The difficulty here for a Christian thinker is that this criterion for true being is verified perfectly by the divine ideas, as well as by God himself in his own being. The ideas in God are indeed eternal and immutable, as the ideal patterns for all creatures and the ground for all truth, which by its nature must be immutable. Since they perfectly verify the criterion, they should indeed be true being, real being for Augustine, just as they were for Plato and Plotinus, from whom the doctrine of divine ideas was directly inherited. Yet strangely enough, Augustine never quite seems to draw this conclusion and speak explicitly of the divine ideas as real being in themselves. He just seems to drop the point, to pull back into discreet silence just before he gets into metaphysical trouble. It is, however, common Augustinian doctrine that things are present more truly and nobly in the divine ideas of them than in their mutable, imperfect, created existence. Perhaps he did not see clearly the difficulty of the ideas as real multiplicity in God, as did Plotinus; or perhaps he did see it, but did not know quite what to do with it, and just quietly let it drop. At any rate, he gives us no clear philosophical principles by which to solve it.<sup>13</sup>

### JOHN SCOTTUS ERIUGENA

Let us now skip to a later Christian Neoplatonist, the early medieval thinker John Scottus Eriugena, whose thought has the advantage for our purposes of bringing together both the Augustinian and the Dionysian traditions. Its special interest lies in that the problems that remained latent and untreated by Saint Augustine now come out into the open with striking sharpness in this daring but by no means always consistent thinker.

The point that concerns us is the ontological status of the second division of nature in the vast cosmic schema of John Scottus’ *De Divisione Naturae*, namely, *natura creata et creans*. This comprises the divine exemplary ideas or, as he calls them, the “primordial causes,” which are the “first creation” of God, coeternal with the divine Word, but always dependent on the Word, in whom they subsist.

They are created but also creating in their turn, charged with the power to unfold and produce the whole material cosmos spread out in space and time.<sup>14</sup>

The first point to notice is the strong Platonic realism of this realm of creative ideas. This is the realm of true being below God (who, for John Scottus, is the superessential Source above being itself).<sup>15</sup> It is in this ideal realm that all creatures, especially the sensible world of creation, have their true being, perfect and immutable; they are more real, they more truly exist, in these eternal idea-causes than in themselves as the explicated effects or emanations of these causes, for the latter are not merely abstract ideas or static models but causal forces charged with creative power of their own, though deriving, of course, from their higher Principle. Thus each one of us exists more truly in the eternal idea of man than in our own temporally spread out existence in this lower material world. We have here one of the strongest statements of what is to be a favorite theme of Christian Neoplatonists all through the Middle Ages, at least in the pre-Scholastic period.<sup>16</sup>

The realism of these primordial causes is also borne out by the assertion that they have been "made," "formed," "created" by God as the first level of creation—a stronger term than any previous Christian thinker had used to refer to the divine ideas, though, to do him justice, he sometimes warns that "created" here is not used in as strong and proper a meaning as its ordinary sense as applied to the second creation, that of the present contingent world. These primordial causes are produced *by* the Father *in* the Word from all eternity, in whom they subsist; yet as made (produced) they deserve to be called created. But what is created by God and which, itself, has causal power must certainly be real, and because immutable, also eternal, and spiritual, that is, authentic being, of which the changing world of bodies is but a shadowy image or participation. No statements of Augustine about the being of this realm of divine ideas are nearly as strong and clear as those found in John Scottus. It looks as though the Neoplatonic world of true being in the *Nous* has reappeared with new vigor and splendor.

It is a little surprising, therefore, to discover that, when Eriugena comes to speak of the mode of being of these primordial causes in the Word, with respect to their real multiplicity and distinction, he asserts in the strongest possible terms that in the divine Word they are absolutely "simple, one, unseparated," perfectly identical with the Word's own being, and "indistinguishable, without differentiae," until they unfold in their actual effects in the space-time sensible world.<sup>17</sup> To illustrate how they subsist in simply unity in the Word, he uses the example of how all numbers are present in the monad before division and how all lines are present in the point that is the center of a circle, with no distinction until they begin to unfold from the center.

Here I have the impression that Eriugena is being a better Christian than a Neoplatonist. I do not see how he can consistently hold both the real being and plurality of the primordial causes and also their perfect simplicity, unity, and identity with the Word as subsisting in it. Plotinus in fact holds the exact opposite, and would object as follows: The way that all numbers are in the number one and all lines in the point at the center of the circle is indeed the way that all things are precontained in the highest principle, the One, who is "the potentiality of all

things" (*dynamis pantôn*) without being any of them. But this is not the way the ideas, the realm of true being, are in the second hypostasis, the *Nous*. There they are indeed held together in the unity of a single undivided spiritual life of intelligence; but this unity is a complex unity, not a simple one: it includes all the distinct intelligibilities of each Idea-Being as intelligibly distinct (though not separated or divided), as well as the distinction between the *Nous* as subject and the realm of being as intelligible object. It is precisely because of this multiplicity that the world of ideas can have no place in the perfect, simple unity of the One, but only in a lower, less unified hypostasis.<sup>18</sup>

But there seems to be no trace in Eriugena of these reservations about the perfect unity and simplicity of the primordial causes in the Word. It is not clear how he can have it both ways, though if he is to remain both a good Christian and a good Neoplatonist he must try. Here we have the latent tension between the conflicting demands of the two traditions coming sharply to a head, since Eriugena pushes each one all the way to the limit. It is a remarkable case of the coincidence of opposites. If one looks at this apparent impasse as a speculative philosopher, there seems to be only one possible way in which one could hold onto both sides of the opposition without contradiction, although this "solution" brings its own new train of problems with it. Suppose that one were to hold that true being, the very being of the primordial causes, is *nothing else but* their being thought by God. Their truth is identical with their being. In this case since the *act* of knowing or thinking them is one single simple act, and they have *no other being* save their being thought, it could be said that their being, as identical with the act of thinking in the Word and never really emanating out from it to possess their own distinct being—until, of course, they are unfolded in the material cosmos—is really one single simple being identical with the Word.

In fact, it seems that this is precisely what Eriugena himself has followed, at least in certain of his strong formulations, such as:

For the understanding of all things in God is the essence of all things . . . all things are precisely because they are foreknown. For the essence of all things is nothing but the knowledge of all things in the Divine Wisdom. For in Him we live and move and have our being. For, as St. Dionysius says, the knowledge of the things that are is the things that are.<sup>19</sup>

For the understanding of things is what things really are, in the words of St. Dionysius: "The knowledge of things that are is the things that are."<sup>20</sup>

It is true that Eriugena does qualify this identity here and elsewhere by calling the divine knowledge the cause of the things that are, so that cause and effect would seem to be distinguished. But if this distinction is pushed too far, hardened into the strong Aristotelian real distinction between cause and effect—and I think this is also true in its own mitigated way in Neoplatonism—then his position on the unity, simplicity, and identity of the primordial causes in the Word will collapse. Only in the relation between thought and its self-generated ideas can there be a real identity of being between cause and effect, *granted* that the ideas have no being of their own.

I have two remarks to make about this doctrine of the identity of thought and being in Eriugena. First, if this is the case, it is now easy to understand how all creatures can be more truly in God, that is, in his knowledge, than in themselves, since it is this knowledge that in fact constitutes their true and perfect being. Another daring doctrine of Eriugena also becomes clear: in a sense, man himself is the creator of the material world, because he holds it together in unity in his own mind, as participating in the divine wisdom, and the material world exists more truly and perfectly even in man's mind than in itself. Again true being is identical with being known. We are here on the edge, if not over the edge, of something like the Hegelian mode of idealism, as has often been pointed out. We will consider the philosophical difficulties of this position later.

Secondly, it seems to me that here Eriugena has gone farther than Plotinus and classic Neoplatonism itself, and in a sense dramatically reversed the old Platonic realism, which on the other hand he seems to be strongly asserting and certainly wishes to assert. For in the Plotinian *Nous*, or world of true being, as we have seen, even though the ideas are held together in the unity of a single unified spiritual life, the act of divine intelligence, still this life, this unity of the world of being and knowing, is a multiplex unity, an intelligible (hence, real) diversity in unity and unity in diversity. The ideas truly emanate from the *Nous*, while remaining within it, to the extent that they are distinguished as subject and object; also the ideas truly have being within them, so much so that it is almost equally legitimate to say that the *Nous* itself is constituted in being by its union with the ideas as to say that the ideas are constituted in being by the *Nous*—there is a kind of reciprocal priority between them; a strong dosage of the old Platonic realism of ideas as in themselves true being still remains. Nothing like this can be found in Eriugena. In no way can it be said that the Word for him is constituted by the ideas it eternally thinks. The relation of dependence is strictly one-way, asymmetrical. His solution is Christian; can it still be called authentically Neoplatonic? I doubt it.

Let us now turn briefly to some of the purely metaphysical difficulties inherent in the Neoplatonic side of Eriugena's doctrine of the divine ideas as true being, with the result that we, like all creatures, exist more truly in our primordial idea-causes in God than in our own "explicated" temporal existence in ourselves—the third division of nature, that which is created but does not create. If this position is taken literally and in full seriousness, then the problem arises, What is the point of this unfolding of our true being, already present from all eternity in God, into our present lesser mode of existence? What is the point of our existential struggle for salvation in human history in a lesser mode of being when we are already perfect in our truest being in God? The whole value of human history, including that of the Incarnation and temporal life of Christ himself, seems to become so secondary and "accidental," as he puts it, that it becomes disturbingly ambiguous, if not tinged with unreality. His only answer seems to be the classic Neoplatonic one, a purely impersonal kind of metaphysical law of emanation—that the emanation must go on to its furthest multiplicity, that the Craftsman of the universe would not have shown forth the fullness of his power unless he had made

all that could be made and unfolded all the oppositions between creatures and not just their harmonies. It should be remembered that in the second division of nature, the primordial causes, there are no oppositions or *differentiae* between the various genera and species; all is perfect togetherness.

This is a typical Neoplatonic theme or axiom of emanation, that the great chain of being must unfold all the way to the limit of its possibilities, by an inherent necessity of the self-diffusiveness of the Good. But such a view of the value and meaning of the contingent world as only an inferior ontological state of the *same* world at a higher level is hardly compatible with the inspiration of Christian personalism, where the supreme locus of value is the existential dimension of freely given personal love, moral nobility, and so on. The subject of the salvific redemption of Christ and the final beatific vision in the heavenly Jerusalem is not the eternally perfect, immutable idea of man, but the unique contingent individual John Smith who has worked out his salvation freely with the help of God on the stage of human history. In a word, there is a profound metaphysical, epistemological, and religious ambiguity in the Neoplatonic conception of the relation of the ideas to true being, not indeed in the presence of exemplary ideas of all things in God, but in their ontological evaluation, namely, that the true being of anything is found more fully, as true being, in its idea state in the mind of God than in itself. The classic Neoplatonic worldview of reality is not ultimately a personalism. The tension, if not contradiction, between this metaphysical view of reality and that implicit in any authentic Christian personalism seems to me to be profound and irreconcilable: it remains one of the central unsolved problems haunting Christian Neoplatonists—also, I might add, Islamic and Sufi Neoplatonists—throughout the pre-Scholastic Middle Ages. To sum it up, as this problem surfaces in John Scottus Eriugena, I do not think he can hold, if he is to be a consistent and authentically Christian thinker, *both* that the primordial causes are absolutely simple and one in the Word, which a Christian must hold, *and* that the true being of all creatures resides in these divine ideas, rather than in their own contingent being in history, which a traditional Neoplatonist should hold. One of these two positions will have to give way if a consistent Christian metaphysics is to develop. But for this we have to look beyond the daring and seminal, but not always consistent, brilliance of John Scottus Eriugena.

In thus casting doubts on the metaphysical consistency and Christian assimilability of the cherished Neoplatonic theme that our true being is found in, consists in, the eternal idea of ourselves in the mind of God, I do not wish to deny the power and fruitfulness of the theme as it functioned—understood somewhat loosely, without pressing its metaphysical implications too rigorously—as a guide for spiritual development in the rich flowering of Christian spirituality during the Middle Ages. The operative concept here is that we understand our true self and come to realize it by turning toward and striving to fulfill the ideal model or exemplar of our fulfilled selves that God holds eternally to his mind and draws us toward by the magnetism of his goodness. Our true selves are indeed *seen* in God's ideas of us, and this vision is pregnant with the magnetic drawing power of the Good. But this does not require the further metaphysical commitment that our

true being, our true selves, literally *is*, consists in, the divine idea of us. But it took a long time for these underlying metaphysical issues to be worked out explicitly in medieval Christian thought.

### THE SCHOOL OF CHARTRES

Let us now move several centuries down the line and take a brief look at another Christian Neoplatonist treatment of the same problem. This is the famous School of Chartres, known for its exaggerated Platonic realism of ideas.<sup>21</sup> Its main themes are really a revival of John Scottus Eriugena with some original variations. The themes we are interested in are the realism of the divine ideas and their ontological status in the mind of God. Again we find almost the identical position of Eriugena. The true being of creatures is found in the divine ideas, which Thierry of Chartres, perhaps the most daring of the school, calls *formae nativae*. These are found in their pure state in the mind of God, and become imprisoned and diminished by union with matter. As Clarembald of Arras tells us, the true being of anything comes from its form: *omne esse ex forma est . . . quoniam forma perfectio rei et integritas est*.<sup>22</sup> But all these forms as in God become a single simple form: God is the *forma essendi* of all forms and through them of all things.<sup>23</sup> But as they exist in God these exemplary forms are not yet explicated or unfolded as they are in the created world. Just as all numbers are already precontained in the simple unity of the monad or number one, so all forms are *complicatae* (enfolded as the opposite of unfolded) in the unity of one form in God. As Thierry puts it in a striking image, in God all forms fall back into the one: "The forms of all things, considered in the divine mind, are in a certain way one form, collapsed in some inexplicable way into the simplicity of the divine form."<sup>24</sup> And thus "every form without matter is God himself."<sup>25</sup>

Clarembald of Arras explains further how the many forms are enfolded without real plurality in the one:

Every multitude lies hidden in the simplicity of unity, and when in the serial process of numeration a second is numbered after the one and a third after the second, then finally a certain form of plurality flowing from unity is recognized, and so without otherness there can be no plurality.<sup>26</sup>

Here again, it seems to me, we run into the same unresolved tension as we found in Eriugena. It is indeed an authentically Christian metaphysical doctrine that all ideas are identical in being with the one perfectly simple being of the divine Mind. But I submit that this is not an authentically Neoplatonic doctrine: the ideas in the divine *Nous* for all classic Neoplatonists are already unfolded in their distinct intelligible multiplicity and hence in their plurality of being, thus forming the system of true being as integrated plurality—a plurality, however, without spatial or temporal separation, held together in the unity-multiplicity whole of a single spiritual life. (It is indeed true—this was objected to me in the discussion of the paper—that the ideas, like all things, are in a sense in the One, as the "power of all things" [*dynamis pantōn*]). But this is in a mode of supereminent simplicity, as

in the power of the cause from which all else emanates, not in the mode of distinct intelligibility or of true being as in the *Nous*. The realm of being is below the pure unity of the One.) And if the thinkers of the school of Chartres insist that these divine ideas or native forms, though simple and one in God, are nonetheless the true being of all things, then we have a metaphysical impasse. *Either* this is ■ metaphysical contradiction or incoherence, *or* true being is nothing but its being thought, has no being of its own but only that of the act that thinks it. This seems to me the conversion of the Neoplatonic realism into a latent idealism that is quite foreign to the original inspiration of the doctrine, and, I believe, to the explicit intentions of the Christian Neoplatonist thinkers themselves. Which side of the dilemma did they actually opt for? I have the impression that they were just not that clearly aware of the metaphysical implications of their thought and made no clear option, but remained oscillating ambiguously somewhere in the middle, unwilling to give up either end of the opposition.

But to be fair to them, the blame is not entirely theirs. They are trying to cope with the rich but enigmatic heritage of the Pseudo-Dionysius, who in his turn has tried to impose a new dialectic of the unmanifest-manifest divinity on the old Neoplatonic doctrine of the emanation of the world of ideas and the *Nous* from the One, but without making it that clear that some significantly new metaphysical laws have been introduced. Although something similar to the unmanifest-manifest dialectic can certainly be found in classical Neoplatonism, still the particular way in which Pseudo-Dionysius interprets it to hold onto the ontological simplicity of God—in terms of the divine "energies" which are both divine, God as *manifested*, and yet somehow multiple—seems to me to have a strong dose of oriental as well as Neoplatonic roots, unless one considers it an original creative Christian adaptation of Neoplatonism. I cannot go into this complicated but intriguing problem here. The Dionysian doctrine has remarkable affinities with the Hindu notion of the *shakti*, or divine power, of the "manifest" Brahman at work in the world. It was given central prominence later in the Eastern Orthodox theology of Gregory Palamas, but was rejected by Western Scholastic theologians. Like the doctrine of multiple divine ideas, it is filled with metaphysical tensions of its own.

### THIRTEENTH-CENTURY SCHOLASTICISM

We now come to a decisive new chapter in the history of our problem, one that finally provides a coherent metaphysical resolution to the almost 1000 years of tension within Christian Neoplatonism. This solution emerges gradually during the twelfth century, due to the struggle over the reality of universals, and finally comes to a head in thirteenth-century Scholasticism. Here the technical precision demanded of professors trained in Aristotelian logic and functioning in a professional academic community could no longer be satisfied with inspiring but metaphysically fuzzy pantheistic-sounding formulas that at the same time repudiated Pantheism, or with the simple assertion of unexplicated paradoxes held together by metaphors such as "all forms fall back into the simplicity of the one divine

form." The crucial decision is finally made: the Platonic realism of ideas must once and for all be given up.

There seems to have been a fairly wide consensus on this point, though, as we shall see, not universal. It was not only the Aristotelian current of Albert and Thomas Aquinas that sponsored it: leading Augustinians such as Saint Bonaventure also agreed. In fact the latter provides us with an admirably succinct summary of the basic position:

God knows things through their eternal "reasons" (*rationes aeternae*). . . . But these eternal intelligibilities are not the true essences and quiddities of things, since they are not other than the Creator, whereas creature and Creator necessarily have different essences. And therefore it is necessary that they be exemplary forms and hence *similitudines representativae* of things themselves. Consequently these are intelligibilities whereby things that are made known (*rationes cognoscendi*), because knowledge, precisely as knowledge, signifies assimilation and expression between knower and known. And therefore we must assert, as the holy doctors say and reason shows, that God knows things through their similitudes.<sup>27</sup>

The die is cast. The divine ideas are no longer the very forms, the true being, of creatures, but their intentional similitudes, whose only being is that of the one divine act of knowing. (It is quite true—as was objected in the discussion—that the divine ideas in Bonaventure seem to have a greater ontological density and dynamism than in Saint Thomas. But this remains the *creative* dynamism of the Word itself and is not the true being of creatures as for John Scottus. The very next question after the above quotation, whether there is any real multiplicity in the divine ideas, makes this clear beyond the shadow of a doubt. Hence, the suggestion made that he qualifies his position in the next paragraph is entirely without textual foundation.) But the firmest and clearest grounding for this common position is provided by Thomas Aquinas, with his new metaphysics of the composition of essence and act of existence (*esse*) in creatures and the location of the real perfection of beings no longer on the side of form but on the act of existence of which form is limiting principle.<sup>28</sup> Thus creatures have no true being until God as creative cause gives them their own intrinsic act of existence, which is not their intelligible essence but a distinct act by which form itself comes to be as a determinant structure of a real being. As creatures are precontained in the divine ideas, they simply do not yet have this act of their own intrinsic *esse*, hence are not yet properly beings at all, let alone the really real. Their "subjective" being is identified entirely with the being of the simple act of divine intelligence which "thinks them up" (*adinvenire* is the word Saint Thomas carefully picks out, which means to invent or think up, not discover, which would be *invenire*) as possible limited modes of participation in his own infinite act of *esse subsistens*.<sup>29</sup> Thus their entire being is their *being-thought-about* by God, in a single simple act without any plurality of real being, though there is a clear plurality and distinction on the level of the objective intelligible content thought about by this one act. In a word, in the new technical terminology, the divine ideas are now only the "signifying signs of things" (*intentiones rerum*), not things themselves; their being is *esse*

*intentionale* not *esse naturale* or *reale*.<sup>30</sup> This crucial distinction between *esse intentionale* and *esse naturale*, in terms of which alone the doctrine makes sense, is the one piece that has been conspicuously missing from the entire Platonic tradition, and for good reasons. To have admitted it would have blown up classical Platonism from within, or at least forced such a profound adaptation as to involve almost a change of essence. The term itself is an inheritance neither of the Platonic nor even the Aristotelian tradition, but from Arabic sources.

This single stroke of distinguishing the subjective being of ideas, which is nothing but the act of the mind that thinks them, from their objective content, their intentional meaning and reference which can be multiple and distinct, opened the way at last to a metaphysically coherent assimilation of the whole Eriugenian doctrine of the presence of the divine ideas in the Word in a single, simple act prior to any plurality. The latter was indeed a brilliant insight of Christian Neoplatonism, but one that could not make sense unless the doctrine that accompanied it in Eriugena—that of the ideas as true being in themselves—was jettisoned. The divorce was painful, but inevitable. But this move also entailed the dropping of another cherished theme of classical Neoplatonism, namely, that the passage from the divine ideas, or realm of true being, to their unfolded exemplifications in the contingent world of matter is a passage to a lower mode of being, a degradation or diminution in being. Creation now becomes, on the contrary, a positive expansion from the merely mental being of the world of divine ideas to a new dimension of true being "outside" the divine Mind (*extra causas*), as an enrichment of the universe through a gracious free sharing of its own real perfection; for this real perfection is always in the line of actual *esse*, and this was not yet accomplished in the realm of the divine ideas by themselves.

The same move also forced, if not the total giving up, at least the drastic toning down and reinterpretation of another closely linked theme long cherished by Christian Neoplatonists in the pre-Scholastic period following the lead of Augustine himself.<sup>31</sup> This is the notion that all creatures exist in a higher, more perfect state in the exemplary idea of each of them in the mind of God than in their own created being—especially so, but not exclusively, in the case of material beings. This theme still keeps recurring in the spiritual writings of Christian Neoplatonists, used as a potent motivation and intellectual model for spiritual growth.<sup>32</sup> But its literal metaphysical force is now toned down.

Clearly Thomas Aquinas cannot hold this as a metaphysical doctrine—and not even Bonaventure, if he is to remain consistent with his text quoted above. For if, as I am present in the mind of God, I do not yet possess any slightest trace of my own intrinsic act of *esse*, in proportion to which alone is measured all my real participation in the perfection of God, then it cannot be literally asserted that I *exist*, have my true being, in a higher and more perfect state in God's idea of me than in my own contingent created existence in myself. It is true that my *intelligibility*, the *intelligible content* of the divine idea of me, exists in a higher, more perfect way in God than in me; but this is still not my true being, my *esse*.

Thomas is quite aware that he is laying aside a long and venerable Augustinian tradition. But as is his wont in so doing, he never directly contradicts it, but

reinterprets it to draw the most he can out of it without compromising his own metaphysical integrity.<sup>33</sup> Thus in the present case he is quite willing to admit that there is a certain fulfillment for a material being to exist, as known, in a spiritual intelligence, *a fortiori* in God's, since in being thus known the material mode of existence is transposed into a spiritual one, that of intentional existence, which is identical with the spiritual act of the mind knowing it. But this fulfillment can exist only if the material being already exists in its own material being and is *also* known in a spiritual mode. The real being of the material thing does not *consist* in its being known and the latter state cannot be substituted for the former with the full value retained. It does remain true, however, that the perfection of our real being is *represented*, held before us by the divine idea as an ideal goal, a final cause, drawing towards its actual *realization* through the drawing power of the Good reflected in it. It functions thus as a powerful *motivation* for spiritual growth toward the fulfillment of our true being to-be-realized; but it is not this true being already existing in the mind of God. For if the latter were literally the case, why bother with working out on an inferior level the same perfection already given on a higher level? This was the enigma haunting, as we saw, Eriugena's emanation from the second to the third division of nature—a problem to which he gave no recognizably Christian solution.

All did not agree, however, with this deontologizing of the divine ideas. Henry of Ghent, teaching in Paris at the end of the thirteenth century, and drawing his inspiration both from Avicenna and Neoplatonism, complains that the more "current theological opinion" has gone too far in rejecting the doctrine of Eriugena and reducing the divine ideas to nothing but understood "modes of imitability of the divine essence (*rationes imitabilitatis*)."<sup>34</sup> To this he opposes "the position excellently expressed by Avicenna in his *Metaphysics*, according to which the ideas signify the very essences of things."<sup>35</sup> Expounding this position elsewhere he distinguished between two aspects of the ideas: (1) "the essences of things in the divine knowledge as objects known . . . which are really other (*secundum rem aliae*) than the divine nature"; and (2) "the *rationes* by which these are known, which are really identical with the divine nature."<sup>36</sup> To explain this he introduces his own technical terms of a distinction between an idea and its *ideatum* or object, and a distinction between the being of essence and the being of existence (*esse essentiae* and *esse existentiae*):

Since therefore the ideas in God exercise causality in every way over the things of which they are the forms, by constituting them in both their *esse essentiae* and their *esse existentiae*, and this according to the mode of the exemplary formal cause, therefore the relation of the divine idea to its *ideata* . . . is according to the first genus of relation, which is that between the producer and its product . . . so that it follows from the divine perfection that from the ideal *ratio* in God, the first essence of the creature flows forth in its *esse essentiae*, and secondly, through the mediation of the divine will, this same essence flows forth in its *esse existentiae*.<sup>36</sup>

But the introduction into Christian thought of this Avicennian attempt to salvage Neoplatonism in a creationist universe, by means of a world of possible

essences which, as someone put it, "stands up stiff with reality" (the reality proper to essence in itself, distinct both from the idea that thinks it up and its later mode of created actual existence), did not find hospitable acceptance among the thirteenth-century and especially later Christian theologians. The ghost of John Scottus Eriugena was no longer welcome at the banquet of Christian theology, although the overtones of the doctrine do linger on in Duns Scotus and down through Descartes, Spinoza, and the early rationalism of modern philosophy.

#### FOURTEENTH-CENTURY NOMINALISM

We cannot conclude our story, however, without a brief word on the final de-nouement in medieval times. The thirteenth century gave birth to a careful balance between a firm maintaining of the presence and role of the divine ideas in God and a firm rejection of their identification with the true real being of creatures. The pendulum now swings all the way to the opposite extreme. The deontologizing of the divine ideas is pursued so relentlessly that the divine ideas themselves, even in their *esse intentionale*, finally disappear entirely. This is the work of William of Ockham and his nominalist followers. His sledgehammer metaphysics, pairing the principle of contradiction with the divine omnipotence, will allow no medium between full reality—evidenced by full real distinction and separability—and nothing at all. One of the first casualties is the *esse intentionale* of the great thirteenth-century metaphysical systems. Either the so-called divine ideas are real being, and thus real multiplicity, in God—which a Christian thinker cannot accept—or they are nothing at all. The divine ideas, venerable tradition though they be, must be resolutely jettisoned in the name of Christian thought purified of all pagan Platonism. Nothing in the divine nature is immutable or eternal except the being of God himself. But God is not an idea:

The divine essence is not an idea, because I ask: the ideas are in the divine mind either subjectively or objectively. Not subjectively, because then there would be subjective plurality in the divine essence, which is manifestly false. Therefore they are there only objectively; but the divine essence does not exist only objectively (i.e., as the object of idea). Therefore it is not an idea.<sup>37</sup>

As Gabriel Biel, a later Ockhamist disciple, puts it succinctly:

These two, namely, immutability or eternity, and multiplicity or plurality, do not seem compatible (for the divine essence, which is immutable and eternal, does not allow that plurality which is posited among the ideas—for each creatable thing has its own proper and distinct idea—and although this plurality is proper to the creature, immutability and eternity are not, but are proper to God alone).<sup>38</sup>

The so-called divine ideas must therefore be banished from God and identified simply with creatures themselves as the direct objects, without intermediary of any kind, of the divine act of knowing. The danger of this position, of course, as became all too clear with the unfolding of nominalism, was that, in the name of saving the divine simplicity, all intelligible structures of creatures as causally prior to creation also seem to have vanished from the divine mind, and we are threat-

ened with an unfathomable abyss in God of pure unilluminated will power which seems at the root of intelligence itself, leading to the substitution of divine will rather than intelligence as the ground of morality. As Biel does not hesitate to put it: "It is not because something is right or just that God wills it, but because God wills it therefore it is right and just."<sup>39</sup> With the banishment of the divine ideas, we have now come full circle in the spectrum of positions within Christian thought. The divine simplicity has been preserved, but at the expense of that other pillar of traditional Christian metaphysics, which Saint Thomas and other thirteenth-century Christian thinkers worked so hard to bring into equilibrium with the divine simplicity, the theory of divine exemplary ideas. The total negation of the Neoplatonic world of ideas is as unacceptable in Christian philosophical thought as its ultraracalism. A Christian metaphysics of God can survive only at a point of balance in the middle. Professor Anton Pegis has made the suggestion, in a brilliant article on "The Dilemma of Being and Unity,"<sup>40</sup> that in thus moving to such an extreme anti-Platonic position, Ockham and the nominalists are still the unconscious prisoners of Platonic thought, accepting uncritically one of its basic presuppositions: namely, that the world of intelligibility is necessarily and unavoidably a world of real multiplicity. The Neoplatonists drew the conclusion that, since being and intelligibility were necessarily correlative partners, then the supreme source of reality, the One, must be beyond both being and intelligibility. The nominalists drew the conclusion that, since the supreme principle must be being, Ultimate Being itself must be raised above intelligibility. But both conclusions proceed from the same premise. The only solution is to do away with the premise itself—that an intelligible order is necessarily linked to real multiplicity. It was this decisive move, rendering Christian Neoplatonism finally viable, that we owe to Saint Thomas and other Aristotelian-influenced thinkers of the thirteenth century.

### CONCLUSION

To sum up briefly, the key point I have tried to make, as a metaphysician reflecting on the history of a problem, is that, although large areas of Neoplatonism can be assimilated for the profound enrichment of Christian thought, there is one doctrine that stubbornly resists coherent assimilation: this is the doctrine of the realism of ideas, that the true being of things consists in the pure ideas of them as found in the mind of God (or elsewhere). This is inconsistent first and foremost with the Christian notion of the existential identity of all the divine ideas, however distinct in their intelligibility or *esse intentionale*, with the one simple act of the divine mind thinking them, so that there is no real plurality in God outside that of the three divine Persons. It is also inconsistent, though this point remained more latent in actual medieval discussion, with the value given to created existence as the gift of God's love and the decisive value given to human salvation freely worked out in contingent history through the Incarnation of the Son of God and the free moral response of historical man. The chapter we have just studied

illustrates once again that the encounter between Neoplatonism and Christian thought was a deeply challenging one, where genuine assimilation and viable synthesis could be brought about only by profound creative adaptation, in some cases even the final rejection, of some aspects of Neoplatonism.

## 12

# Meister Eckhart on God as Absolute Unity

BERNARD MCGINN

The history of the relation between Neoplatonism and Latin Christian theology is long and complicated, the names of its protagonists many. Ambrose and Augustine, Boethius, John the Scot, Bonaventure, Meister Eckhart, and Nicholas of Cusa are only some of the figures that would appear on any list of the major attempts to make use of Neoplatonic thought as a vehicle for the speculative appropriation of Christian belief. But brief reflection on the fates of these seven sages gives us pause. The views of two of them, John the Scot and Meister Eckhart, were subject to posthumous ecclesiastical condemnation, and Boethius, if safe from criticism in the medieval period, has been subject to accusations of being a "closet pagan" by modern scholars over the past century. Such condemnations and suspicions seem to confirm the feeling that Neoplatonic thought is at best a problematic (and frequently an unhelpful) language for the expression of Christian theology. Such general feelings, however, are rarely very useful for the historical theologian, except when tested and confirmed in particular cases. They are especially dangerous when the contrasted poles of the comparisons and contrasts (e.g., Neoplatonism and Christianity) are treated as clear and distinct sys-

tems miraculously exempt from historical development and change. The following essay attempts to study one example of the interaction between an important aspect of Neoplatonic thought, in this case the dialectical understanding of the One or Absolute Unity, and the Christian doctrine of God as found in one of the most controversial of the Christian Neoplatonists, Meister Eckhart.

This test case is a significant one. Along with John the Scot and Nicholas of Cusa, Eckhart is arguably the most systematic of the Latin Neoplatonic dialecticians, and he is the one who suffered the most for it. The majority of the twenty-eight propositions from his works condemned by Pope John XXII in the Bull "In agro dominico" of March 27, 1329, involve or imply aspects of his appropriation of Neoplatonism. Three of them (articles 23, 24, and 26) relate directly to his doctrine of God, the subject of this paper.

Nearly everyone agrees that there are problems in Meister Eckhart's doctrine of God. Less consensus is found about what the main problems are, and agreement about the best way to resolve them is rarer still. By its very mode of presentation Eckhart's thought invites, even encourages, disagreement and polemics among its interpreters. Not only the problem of the relative weight to be accorded the Latin and the German works, but also the occasional character of many surviving texts has bedeviled subsequent students. In a brief paper definitive solutions are not to be expected, but it may be possible to set out on the road that leads to a more adequate understanding of what the German Dominican taught concerning God as a way of illustrating the encounter between Neoplatonism and Christianity. This investigation will be in three unequal stages. First, a brief note of three major problems in Eckhart's teaching on God; second, an analysis of the Meister's interlocking theories of predication, analogy, and dialectic as a way of beginning to resolve the first of these problems; and third, a reflection on the nature of Christian Neoplatonism suggested by Eckhart's dialectic of the One.

As is well known, in the first of the *Parisian Questions*, dated 1302 or 1303, Eckhart denies the Thomistic thesis that existence (*esse*) and understanding (*intelligere*) are the same in God and affirms the priority of understanding to existence in the divine nature:<sup>1</sup> "I say that if there is anything in God that you want to call existence, it belongs to him through his understanding."<sup>2</sup> In the prologue to the *Opus Tripartitum*, which is probably late but cannot be dated with security, the first of the theological axioms analyzed is that "Existence (*esse*) is God." Here the Meister affirms that the four transcendental predicates of existence, unity, truth, and goodness can be applied to God alone in the proper sense, while the title and order of treatment suggests that he accords clear priority to *esse*. The many attempts to deal with this first problem in the German Dominican's doctrine of God may be broadly broken down into those which admit contradiction, surmizing that Eckhart changed his mind,<sup>3</sup> and those that try to show the inner unity of the two texts either by appealing to diverse perspectives or by locating the presentations within a broader and more systematic treatment of Eckhartian theology.<sup>4</sup>

A second disputed area arises from the study of passages in some of the German works that seem to affirm a distinction between God and the Godhead.<sup>5</sup> Traditional Latin theology, enhanced by the condemnation of the supposed Trini-

tarian errors of Gilbert of Poitiers at the Council of Rheims in 1148, resisted any separation of the Trinity from a prior unmanifested divine essence. How seriously are we to take Eckhart's language then? The answer to this question depends on many prior issues concerning the relation of the German to the Latin works and the author's teaching on the Trinity. Many would agree with those who suspect that the distinction between God and the Godhead indicates that Eckhart viewed union with the divine nature in a way that was not distinctively Christian in the last analysis.<sup>6</sup> Others would contend that there is at least a definite priority of the divine unity over the Trinity in the Eckhartian view.<sup>7</sup>

A third problem follows hard apace. Perhaps no part of Eckhart's teaching was more controversial, in his own day as in ours, than his statements regarding the birth of the Word in the soul. The papal bull of condemnation refers to this teaching in six of its twenty-eight articles, and debate about the meaning of such claims as "... the Father generates me his Son and the same Son. Whatever God does is one, and for this reason He generates me his Son without any distinction"<sup>8</sup> has continued to our own day. Eckhart defended his pronouncements with vigor in his response to his accusers, the *Rechtfertigungsschrift* or *Defense*. He even said that he had never taught that a part of the soul was uncreated, a position that may seem contradictory to assertions in his surviving works.<sup>9</sup> But the Meister was a true Scholastic, well able to invoke a distinction where others would see only a contradiction. Where does the truth lie? The massive problems surrounding Eckhart's teaching on the birth of the Word in the soul, while more directly related to his theological anthropology than to his doctrine of God, necessarily have profound ramifications for the latter. One can take Eckhart's *Defense* at face value and see nothing more in his teaching than traditional theology expressed in novel language,<sup>10</sup> or one can discern seemingly inevitable pantheistic implications of the birth of the Word in the soul.

These three problems are too complex to be open to any brief and facile solution. Within the limits of a paper, however, it may be possible to suggest an avenue of approach to the language contrasting God as *esse* and God as *intelligere* that will show that there is no contradiction in this area of the Meister's thought.

Like most well-trained Schoolmen, Eckhart was a logician as well as a metaphysician and theologian. Perhaps beginning at the humble level of his theory of predication may both help avoid errors in loftier domains and also hint at the systematic coherence of this thought. Most notably in the prologues to the *Opus Tripartitum*,<sup>11</sup> though not absent elsewhere,<sup>12</sup> we find in Eckhart a doctrine regarding two modes of predicating terms that, while it is based upon the teaching of Aristotle and Aquinas, has quite different implications. Thomas had used the distinction between two-term and three-term propositions to reflect on the nature of the language we use about created reality. A two-term proposition (*secundum adiacens*), one in which the verb stands as the second term, intends to affirm that the action predicated is really taking place. Thus *Socrates currit* or *Socrates est* affirm that Socrates really is running or really exists. A three-term proposition (*tertium adiacens*), on the other hand, one in which the verb "is" serves as the copula uniting the subject with a predicate and thus forms the third element in the

sentence, does not make any assertion about the actual relation of subject and predicate, but only about their logical relation. Thus, *Socrates est albus* affirms that whiteness is logically compatible with Socrates without direct consideration of whether or not Socrates really exists.<sup>13</sup>

Eckhart, on the other hand, used the distinction between *secundum adiacens* propositions like "X exists," and *tertium adiacens* propositions like "X is this," to reflect on the difference between the language we use about God and the way we speak of created reality. While he nowhere denies the Thomistic application of both kinds of propositions to created being, his analyses concentrate upon the preeminent case of the transcendental terms of existence, unity, truth, and goodness.

For when I say that something exists, or I predicate one, true, or good, these four terms feature in the predicate as the second term (*secundum adiacens*) and are used formally and substantively. But when I say that something is this, for instance a stone, and that it is one stone, a true stone, or a good this, namely a stone, these four terms are used as the third term (*tertium adiacens*) of the proposition. They are not predicates but the copula, or they are placed near the predicate.<sup>14</sup>

Eckhart's use of the distinction here rests upon the difference between unlimited and limited predication. Two-term propositions imply the unlimited possession of the predicate, its absolute fullness, the negation of its negation.<sup>15</sup> Hence in the case of the transcendentals, they can properly apply to God alone. "God alone properly speaking exists and is called being, one, true, and good."<sup>16</sup> In three-term propositions the key is the particularity of the predicate, the "this" or "that." The transcendental term is here reduced to a "kind of copula"<sup>17</sup> that connects predicate and subject according to a manner of classification, that is, "X is in the class of those things that are particular according to existence or unity, and so on." This logic of propositions coheres exactly with the well-known distinction between *esse simpliciter* and *esse hoc et hoc* which Eckhart uses throughout the prologues and elsewhere to express the separation between God and creation.<sup>18</sup>

This overriding sense of the difference between God and creation expressed in the two types of predication is helpful for understanding some of the peculiarities of Eckhart's doctrine of analogy.<sup>19</sup> Here again, while the terminology has its starting place in Thomas Aquinas, the development takes a very different direction. The *Parisian Questions* note that nothing is formally in both the cause and the effect if the cause is a true cause,<sup>20</sup> and since only analogous causes are true causes for Eckhart,<sup>21</sup> we should not be surprised that the Meister's understanding of analogy is centered on formal opposition rather than on proportionality, intrinsic attribution, or participation. In a classic text like that in the *Sermons and Lectures on Ecclesiasticus* (nn. 52-54),<sup>22</sup> we are told that

... analogates have nothing of the form according to which they are analogically ordered (*analogantur*) rooted in positive fashion in themselves, but every created being is analogically ordered to God in being, truth, and goodness. Therefore, every created being radically and positively possesses existence, life, and wisdom from and in God and not in itself.<sup>23</sup>

This analogy of "extrinsic attribution" is found throughout the Latin and German works.<sup>24</sup> It is at the root of the denial of *esse* of God in the *Parisian Questions*,<sup>25</sup> and is also found in the vernacular *Book of Divine Consolation*.<sup>26</sup> It seems less important to debate whether this doctrine of analogy results in a mere quasi-Lutheran imputation of being to creatures as E. Gilson argued,<sup>27</sup> or a fleeting sense of loaned being as J. Koch held,<sup>28</sup> than to recognize that what is most distinctive about Eckhart's analogy is its ability to reverse itself.<sup>29</sup> If *esse* and the other transcendentals are understood as referring to the existence of creatures, the terms cannot be used of God; rather, he must be seen as something above such existence. If *esse* is taken *simpliciter*, it is properly predicated of God in *secundum adiacens* propositions and improperly predicated of created reality in *tertium adiacens* ones. The observation that Eckhart's notion of analogy is a two-edged sword is not meant to deny that he usually strikes with one side, that is, that explicit treatments of analogy are usually designed to affirm something of God and deny it of creatures,<sup>30</sup> or to affirm something from the point of view of principial knowing, as C. F. Kelley would have it.<sup>31</sup> One of the propositions for which the Meister was condemned was that "All creatures are pure nothing. I do not say that they are a little something or anything, but that they are pure nothing."<sup>32</sup>

Predication and analogy call out for dialectic to complete the picture. These are not three different approaches or methods; they are more correctly seen as three levels of increasing depth in Eckhart's presentation of God and his relation to creation.<sup>33</sup> What the dialectical level shows is that the inner meaning of *secundum adiacens* predication and of the reversible analogy of *esse* and *intelligere* as God-language is best expressed in the *unum* (the One, or Absolute Unity) that simultaneously manifests both the utter transcendence and the perfect immanence of the divine nature.

In his exegesis of Wisdom 7:27, "And since Wisdom is one, it can do all things," Eckhart gives the most sustained treatment of the dialectic of divine transcendence and immanence found in his corpus. He begins from the specification of the first of the related poles of the meaning of *unum*: "... the term 'the One' is the same as 'indistinct,' for all distinct things are two or more, but all indistinct things are one."<sup>34</sup> Right from the outset, he associates *esse* with the indistinction of the *unum*, thus hinting at the important relation between this text and his prologues.<sup>35</sup> "Saying that God is one," as he puts it, "is to say that God is indistinct from all things, which is the property of the first and highest *esse* and its overflowing goodness."<sup>36</sup> On the basis of this pole of indistinction three proofs are advanced that God is one.<sup>37</sup> Then the first part of the text closes with a brief remark that precludes the investigation of the other pole of the dialectical understanding of *unum*: "Therefore, it must be recognized now that the term 'the One' sounds negative but is in reality affirmative. It is the negation of negation which is the purest affirmation and the fullness of the term affirmed."<sup>38</sup>

In the second part of his treatment Eckhart further analyzes *unum* and its relation to multiplicity in order to advance a single argument for the unity of divine wisdom. The argument centers on an extended consideration of the meaning of "negation of negation," perhaps the most detailed of all the Meister's

treatments of this key notion. Because *unum* adds nothing to *esse* except negation, that is, the affirmation that it is nothing else than itself, "... it is immediately related to *esse* and signifies the purity and core and peak of *esse* itself, something which even the term *esse* does not."<sup>39</sup> Hence Absolute Unity or the One belongs most properly to God, even more than such other transcendental terms as Truth and Goodness. The conclusion reached through the investigation of the notion of Absolute Unity is then buttressed at the end of the second part by an appeal to Macrobius, Boethius, and Proclus on the relation between the opposition/distinction and participation/indistinction of the One and of number.<sup>40</sup>

This sets the stage for the third and most interesting part of the exposition. Drawing together what has already been implied, Eckhart shows how the two poles of *unum*, both involving negative and positive moments, cannot be separated, but are indissolubly linked in a dialectical coincidence of opposites. "Nothing is as distinct from number and what is numbered or numerable, that is, what is created, as God, and yet nothing is as indistinct."<sup>41</sup> Three proofs are advanced to demonstrate distinction or transcendence and three proofs of indistinction or immanence. The first two arguments for the complete transcendence of the One over creation can be seen as parallels to the separation between God and creation implied in the Meister's doctrines of predication and of analogy. The third proof is new and it is a dialectical one:

Everything which is distinguished by indistinction is the more distinct insofar as it is indistinct, because it is distinguished by its own indistinction. Conversely, it is the more indistinct insofar as it is distinct, because it is distinguished from indistinction by its own distinction. Therefore, it will be the more indistinct insofar as it is distinct and vice versa.<sup>42</sup>

In order to grasp the import of this crucial but dense passage, it may be helpful to paraphrase the key sentences in terms of transcendence and immanence and their relation to the language of *esse*. "Everything which is distinguished by indistinction is the more distinct insofar as it is indistinct, because it is distinguished by its own indistinction" can be read as: "Everything which is transcendent by reason of immanence is the more transcendent insofar as it is immanent, because it is made transcendent by its own immanence." In brief, God transcends creation because he is immanent to all creatures, or, in the language of existence, God alone is true *esse*. The following sentence, "... it is the more indistinct insofar as it is distinct, because it is distinguished from indistinction by its own distinction," means that: "It is more immanent insofar as it is transcendent because it differs (transcendently) from immanence by a difference that is no difference at all." Briefly put, God is the more immanent to creatures the more he transcends them because the distinguishing characteristic of the One is its indistinction from all things. In the language of *esse*, God is immanent to all creatures as their transcendental existence.<sup>43</sup> Thus while this text initially may sound like a mere verbal game or wordplay (and no one would want to deny that Eckhart loved verbal games), the play is meant to reveal, insofar as human language ever can reveal, the dynamics of the relation between God and creation.

The same structure of argument is repeated in the three proofs of the indistinction or immanence of the One in all things. The first is perfunctory, the second a summary of an earlier argument, the third is dialectical and crucial. "Nothing is as indistinct from anything as from that from which it is indistinguished by its own distinction. But everything that is numbered or created is indistinguished from God by its own distinction, as said above. Therefore, nothing is so indistinct and consequently one. The Indistinct and the One are the same; hence God and any creature whatever are indistinct."<sup>44</sup> The exposition concludes by a return to the exegesis of the Scripture verse. Having demonstrated that wisdom is One, Eckhart gives three arguments that it can do all things by applying the seventeenth axiom of the *Liber de causis*, ". . . insofar as a thing is simpler and more unified, it is stronger and more powerful, able to do many things."<sup>45</sup>

Space precludes a detailed consideration of other passages, but it is easy to show that the fundamental lines of this text from the *Commentary on Wisdom* appear throughout Eckhart's treatments of the divine nature. The first pole of the dialectic, the understanding of *unum* as *indistinctum*, that is, the "not-to-be-distinguished,"<sup>46</sup> and therefore as properly predicated of God alone, is constant throughout the Meister's works.<sup>47</sup> The other pole—namely, that *unum* signifies complete self-identity, the negation of negation that is the purest and highest form of affirmation—according to J. Quint's enumeration appears fifteen times in the Latin works and in some detail in the twenty-first of the German Sermons.<sup>48</sup> Although Thomas Aquinas had twice spoken of unity as the negation of negation,<sup>49</sup> it seems difficult to deny some influence to William of Moerbeke's translation of Proclus' *Commentary on the Parmenides* on the important place of negation of negation in Eckhart's thought, however different the uses of the Athenian and the Thuringian may have been.<sup>50</sup>

What is most characteristic of Eckhart's understanding of God as Absolute Unity is the dialectical way in which it demonstrates the coincidence of opposites of divine transcendence and immanence. Even the passages in which the Meister explains the dialectical relation of God and creatures in slightly different language, such as the *Commentary on Exodus* (20:3–4), where a polarity of *similitudo/dis-similitudo* is joined to that of *distinctio/indistinctio*,<sup>51</sup> do not fundamentally depart from the message of the *Commentary on Wisdom*. Among the many texts that treat of the dialectic in explicit or implicit fashion,<sup>52</sup> it may be worthwhile to single out two in order to reveal how the Meister communicated his teaching to the broader audience of the Sermons. In the Latin Sermon IV, on the text from Romans 11:36, "Ex ipso, per ipsum et in ipso sunt omnia," Eckhart gives a concise summary of four anthropological implications of the dialectic of distinction and indistinction. The third is the most significant:

Because, just as God is completely indistinct in himself according to his nature, in that He is truly and most properly one and most distinct from other things, so too man in God is indistinct from all things in God (for "everything is in Him") and at the same time completely distinct from all things.<sup>53</sup>

A similar anthropological application is present in the well-known German Sermon, "Blessed are the Poor," where it is more daringly formulated as a technique to invite the soul to break through beyond the realm of opposition implied in the terms "Creator" and "creature" to the region where the opposites dialectically coincide.

Where man still preserves something in himself, he preserves distinction. This is why I pray God to rid me of God, for my essential being is above God insofar as we comprehend God as the principle of creatures. Indeed, in God's own being, where God is raised above all being and all distinctions, I was myself, I willed myself, and I knew myself to create this man that I am.<sup>54</sup>

It is now time to ask how the inherently dialectical character of Eckhart's doctrine of God as Absolute Unity helps to solve the problem presented at the outset. Specifically, how does God as *unum* relate to the teaching of the prologues on God as *esse* and to the claim of the *Parisian Questions* that *intelligere* and not *esse* is more adequate in speaking of the divine nature?

The relation between *esse* and *unum* as the *puritas essendi* should be evident from the texts analyzed. No theme in Eckhart is more constant than his identification of God with *esse simpliciter*.<sup>55</sup> But the texts from the *Parisian Questions* and elsewhere that suggest the limitations of the language of *esse* must be taken seriously. These strictures spring not only from the reverse analogy of which Eckhart was so fond (i.e., if *esse* is properly predicated of creatures, it cannot apply to God), but also from the implications of the transcendental uses of "esse." While it is never incorrect to say that God as *esse simpliciter* is also the *esse omnium*, or existence of all things, the term "esse" seems semantically less capable of revealing the dialectical coincidence of transcendence and immanence in the same way that *unum* understood as the *negatio negationis* and *puritas essendi* does.

The similarities and differences in the dialectical availability of *esse* and of *unum* are well illustrated by a series of passages in the *Commentary on John*. In exegeting John 3:34 Eckhart appropriates the One (*li unum*) to the divine substance, the unity underlying the three Persons of the Trinity, while *ens*, *verum*, and *bonum* are ascribed to the Father, Son, and Holy Spirit.<sup>56</sup> But in his treatment of John 10:30 ("The Father and I are one"), the Meister reverses this and identifies *esse* as what is absolute and undetermined in God, that is, the Godhead or essence, so that *unum* ("... that which among the four transcendentals is most immediately related to *esse*") is ascribed to the Father, and *verum* and *bonum* to the Son and Holy Spirit.<sup>57</sup> But the *unum* of which Eckhart speaks in this and similar passages is not identical with the full range of the dialectical understanding of *unum* of the *Wisdom* commentary. It represents only an aspect of it, that of the distinction that first sets *esse* off from all multiplicity and makes the Father the first productive principle within God and in creation.<sup>58</sup> In this passage, however, the Meister does seem to suggest that *esse*, when properly understood, can also reveal the dialectical relations within the Godhead and between God and all things, for it

is described as *absolutum* (or distinct) and *indeterminatum* (or indistinct). This dialectic in the key of *esse* comes out more strongly in a passage from the extended *Commentary on John* (14:8):

The idea of being is that it is something common and indistinct and distinguished from other things by its own indistinction. In the same way, God is distinguished by his indistinction from any other distinct thing, and this is why in the Godhead the essence or existence is unbegotten and does not beget. The One points to distinction by its particular property; it is indistinct in itself, but distinct from other things and therefore it is personal and belongs to a supposit capable of acting. Hence the saints attribute the One or unity in the Godhead to the first supposit or person, namely, the Father.<sup>59</sup>

Such passages demonstrate that both forms of language can be used to explore the same territory, though it is significant to note that in Eckhart's surviving works no treatment of the dialectical character of *esse* is as richly developed as the passage on *unum* of the *Wisdom* commentary.

Finally, the broad lines of the relation of *esselunum* and *intelligere* are clear enough, even though all the implications and ramifications are quite complex. To understand is to become *one*, or better, to *be one*, with what is understood—if we keep this fundamental insight in mind, the seeming contradictions of Eckhart's earlier and later formulations of the relation of *esse* and *intelligere* begin to recede.<sup>60</sup> The solution is obvious in Latin Sermon XXIX where the German Dominican advances eleven reasons for the priority of *unum* in the creature's striving toward God as a basis for reflecting on the intimate unity of *unum* and *intelligere*. Eckhart claims that Absolute Unity or the One is proper to the intellect alone, because all material beings are composed of matter and form, and immaterial beings are also composed, at least of *essentia* and *esse*, and more radically of *esse* and *intelligere*.<sup>61</sup> God alone lacks these compositions because he is *one*, he is pure *esse* and totally *intellectus*.<sup>62</sup> Eckhart affirms: "Intellect is proper to God, and God is one. Therefore, to the extent that each thing has intellect or that which pertains to intellect, it also has God, the One, and unity with God. For the one God is intellect and intellect is the one God."<sup>63</sup> The *puritas essendi* and the *puritas intelligendi* are fundamentally identical in the indetermination of Absolute Unity which is also the *plenitudo* of all things.

The dialectical character of Eckhart's notion of God is not a new discovery. In his classic study *Théologie négative et connaissance de Dieu chez Maître Eckhart*, Vladimir Lossky put great stress upon it,<sup>64</sup> and M. de Gandillac later devoted a valuable paper to the Meister's dialectic.<sup>65</sup> But the term "dialectic" itself has meant different things to different interpreters, an ambiguity that may be at the root of the puzzling denial of some that there is any dialectic in Eckhart's thought at all.<sup>66</sup> So it may be worthwhile at this point to reflect on the sense in which dialectic is being used here.

In his essay on "Hegel and the Dialectic of the Ancient Philosophers," H. G. Gadamer notes that Hegel maintained that all three of the essential elements of dialectical thinking—thinking of determinations by themselves, simultaneously

thinking of contradictory determinations, and the positive content of the higher unity of contradictory determinations—were present in ancient philosophy by the time of Plato.<sup>67</sup> Whether Hegel's interpretation of Plato was a simple misreading or a creative "refusal to listen" does not concern us here;<sup>68</sup> what does is Gadamer's observation that Hegel's reading of Plato had been largely shaped by Neoplatonism's theological-ontological interpretation of the *Parmenides*. Along with V. Lossky and M. de Gandillac, we should all probably want to distinguish between the dialectic of Hegel and that of the Meister Eckhart in many ways, but it does seem that Gadamer's three broad notes can provide us with the contours of a genus within which we may begin to distinguish species, and that the influence of the *Parmenides*, especially in its Neoplatonic readings, whether directly or indirectly available, affords important historical continuity to the history of dialectic in Western thought.

The real issue concerning the significance of dialectical thinking revolves around how the third element, the positive content of the higher unity of contradictory determinations, is conceived. Perhaps the beginning of wisdom here is a reflection upon the purposes for which dialectic was invoked, the kinds of problems the method was called upon to help resolve. I have suggested that for Meister Eckhart dialectical thinking functioned as a way to bring to speech in speculative fashion Christian belief in a God that was both utterly transcendent and yet perfectly immanent, more present to the creature than the creature was to itself. The use of Neoplatonic dialectic for this purpose has a long pedigree. As S. Gersh has pointed out, Christian Neoplatonists, beginning at least with the Pseudo-Dionysius, diverged from their pagan predecessors and contemporaries by shifting attention away from consideration of the emanationist structure of reality toward an attempt to investigate God considered as transcendent cause, immanent cause, and both transcendent and immanent cause at the same time.<sup>69</sup> Despite the preparation for this type of dialectic found in places in Plotinus,<sup>70</sup> it seems fair to say that in the light of the writings of the Pseudo-Dionysius, Maximus the Confessor, John the Scot, Eckhart, and Nicholas of Cusa (to name but the most outstanding), the full development of this particular application of dialectical method to the problem of God is distinctive of Christian Neoplatonism.<sup>71</sup>

We may, of course, wish to question the viability of such an approach. Many have felt uncomfortable with the theology of those listed above, as the condemnations of John the Scot and Eckhart demonstrate. That eminent twelfth-century Platonist, William of Conches, once felt constrained to declare indignantly: "Christianus sum, non academicus,"<sup>72</sup> but he may have been just another deluded intellectual. Another eminent Plato scholar, Friedrich Schleiermacher, was also accused of the reverse miracle of changing gospel wine into the water of human philosophy, though not that of Plato or Plotinus. Schleiermacher's answer, as put forth in his *Brief Outline of Theology*,<sup>73</sup> may be more helpful to us than William's. The Berlin theologian recognized both the necessity and the risks in using philosophical systems to help give systematic expression to Christian belief. For him philosophy was a real, if subordinate, "codeterminant" in the ever-unfolding task of the intellectual presentation of that Christian consciousness whose own internal

development remained the primary reason for the continuing necessity of new dogmatic formulation.<sup>74</sup> Whether or not we are totally at one with Schleiermacher's formulation, once we admit the full entry of the historical dimension ("development of doctrine" for the optimists) into Christian belief, it seems hard to avoid some analogous explanation. Codetermination need not mean domination, nor does it imply the absence of criteria to discriminate useful appropriations of philosophy from less helpful ones. The history of the Christian adaptation of Neoplatonic understandings of the dialectic of the *Parmenides* suggests that one of the criteria of success is the degree to which the exigence for the transposition and reinterpretation of the language of the philosophical source in order to deal with issues more central to the consciousness of the Christian community is realized. Much of the debate over the propriety of a dialectic like Eckhart's as a language for Christian theology has not paid sufficient attention to this note of reinterpretation, but has tended to judge success on the grounds of conformity to more easily assimilated forms of language.

Discussion of the relation between varieties of dialectical thought and Christian theology has been so intense over the past generation that it would be impossible to try to summarize the state of the question here. On the basis of our study of Eckhart's doctrine of God, however, some of the misunderstandings of the early stages of the debate are evident. A good example of one misunderstanding can be found in E. Coreth's 1951 essay on the usefulness of dialectic in theology.<sup>75</sup> Coreth's negative response to the invocation of dialectic as a codeterminant in the task of Christian theology (admittedly addressed primarily to Hegel) helps us to understand the insufficiency at the roots of the discomfort that many have felt with the dialectical implications of Eckhart's thought. Coreth did see that both analogy and dialectic have similar functions—the mediation of the one and the many, identity and difference,<sup>76</sup> or, in our theological formulation, transcendence and immanence. But he was still dissatisfied with dialectic's ability to provide an answer consonant with Christian belief. His position was that dialectic formulates its positive and negative moments as opposition and identity rather than as unlikeness and likeness, and thus remains trapped in the categories of human logic that allow no openness to true transcendence.<sup>77</sup> But analogy is still a form of human speech and logic, and there is no getting around the fact that if we are to speak of God it must be done in a language that is our own. On the purely logical level, it remains to be proven that opposition and identity are less inadequate than unlikeness and likeness as a way of speaking about God. Historical doubt is not the equivalent of speculative certainty, especially when the minority view may not have been given a totally fair hearing.

Despite the *a priori* elements of his evaluation, Coreth's essay is a useful starting point for a consideration of the relation between Christian thought and dialectic, not least of all because of its direct influence upon V. Lossky's attempt to vindicate for Meister Eckhart a mediating position between Scholastic analogy and modern dialectical thought.<sup>78</sup> Lossky's response seems in many ways correct, though in need of expansion from at least two sides. From the historical viewpoint, his failure to integrate predication, analogy, and dialectic as increasingly

more profound ways of dealing with the same set of problems at times led to confusion of the analogical and dialectical levels, though he was eminently correct in noting that the lack of synthesis in the crude sense sometimes attributed to Hegel in Eckhart did not mean the absence of what Gadamer would call a positive content of the higher unity of contradictory determinations.<sup>79</sup> From a theological viewpoint, Lossky wrote at a time when the acceptance of a plurality of theological languages, at least within the Roman Catholic tradition, was still highly suspect. If that monolithic view of theology has been overcome, we may hope that a more fruitful encounter between Eckhart's dialectic and contemporary views of God is both possible and desirable.

In concluding, we must remember that Eckhart's dialectical view of God was never meant to be mere abstract speculation. The positive content of the higher unity of contradictory determinations is as much a message about man as it is about God. Eckhart the preacher and Eckhart the teacher labored to the same end—to help each believer to a full union with the God who remains ever distinct and indistinct. The Dominican preacher's message that we are in God precisely because he is transcendent to us is strangely simple and at the same time baffling in its paradoxicality. The insoluble elements of his solution are not the least part of the attraction the great Meister continues to exert.

*RENAISSANCE  
THOUGHT*

*Neoplatonism and  
Christian Thought in  
the Fifteenth Century  
(Nicholas of Cusa and  
Marsilio Ficino)*

MAURICE DE GANDILLAC

For Neoplatonism in the period between the end of the Middle Ages and the beginning of the modern period we shall consider here two significant witnesses who, taken together, occupy the entire fifteenth century, since Nicholas Krebs, who died in Todi in 1464, was born sixty years before on the right bank of the Moselle, in the little town of Kues (now merged with Bernkastel) and Marsilio Ficino, born in 1455 at Figline in the valley of the Arno, was to finish his life in Florence barely three months before the end of the quattrocento.

Apart from the differences in age (a whole generation) and country of origin, the contrasts between these two clerics are manifest. A canonist by formation, admitted to the Council of Basel to plead the cause of a great ecclesiastical lord who had supported him at the start of his career, soon taking the lead in the assembly through his learning and ability, joining the papal party as soon as the opponents of the pope had displayed their incompetence, a militant bishop and then a cardinal of the Curia, ■ mathematician but with a curiosity also for experimentation and observation, Nicholas is a man of action as well as a historian and philosopher. The son of a doctor and himself a doctor (though a theoretician rather

than a practitioner), Marsilio lived far from the labors of public life; this humanist who was not ordained priest until 1474—after having completed his Latin translation of Plato—long enjoyed the leisure for scholarship that the patronage of the Medici secured for him.

In 1440 when presenting to Cardinal Cesarini the three books of the *De docta ignorantia*, the Cusan (in Latin, *Cusanus*, from the name of his home town) asked the indulgence of the Italians for his style, heavy and rich in neologisms. In fact, the language that the author uses says well, essentially, what it wants to say and, in his Paris edition of 1514, Lefèvre d'Étaples was not always well-inspired in "correcting," in his fashion, the text which appeared in Strasbourg in 1488. But in spite of a persistent legend—of which Cassirer still took advantage—Nicholas had only a superficial smattering of Greek. As Martin Honecker<sup>1</sup> has shown, he knew the alphabet and recognized some words, not at times without misconstructions; lacking a Latin translation, even with the aid of a lexicon, he could not draw much on the manuscripts brought from Byzantium. We know well that Ficino, on the contrary, an excellent Hellenist, was a good writer and at the same time a very sure translator.

Much rather than any influence—a problematic question—of the Mosellan on the Florentine, what authorizes us to compare these two Christian Platonists is first of all that apart from its Eleatic and Pythagorean sources, both of them willingly root the doctrine they venerate—this to a great extent under the influence of Proclus—in a mythical Orient; but it is especially the fact that if they discern more than one doctrinal nuance within the school and if they happen to share the same views on essential points, neither of the two is, however, fully conscious of the difference in the spiritual and philosophic climate between the time of Plato and that in which his later disciples lived and taught. One is not very surprised that the Cusan thought that he often heard the voice of the old master in the mouth of Dionysius or of Proclus. One is a little more surprised that Ficino, better armed philologically when he presents his Latin version of the *Enneads*, familiar though he is for decades with the real Plato, still invites his readers to listen to *Platonem ipsum sub Plotini persona loquentem*.

\* \* \*

Vergerius de Buxis (or Giovanni Andreas dei Bussi) had been for six years the secretary of the Cusan; he appears as a "Platonic" interlocutor in the *Possest* of 1460 and in the *Directio speculantis* of 1462. In 1469 he published, under the patronage of Cardinal Bessarion—thanks to the industry of some German printers, in the studio founded in Rome in 1463 by Cardinal Barbo (the future Paul II)—an *incunabulum* that combined some works of Apuleius with the *Disciplinarum Platonis Epitome* then attributed to Alcinoüs, a work which had recently been translated by Balbo who had dedicated his work to Nicholas. It was a fine occasion for Bussi, now librarian to the Vatican, to address to the pope a dedicatory epistle and to unite in the same eulogy these two admirers of Plato, namely the two cardinals and friends, the Greek and the German.

This text is believed to be the oldest in which explicit mention is made of an

"intermediate age" (or Middle Age). Nicholas, dead for five years, appears in it as the indefatigable reader who had "held in his memory" *historias omnes, non priscas modo, sed mediae tempestatis, tum veteres, tum recentiores, usque ad nostra tempora*, but what is more important for us is that the author of this panegyric appears to place on the same level two *doctorum principes* who speaking truly—as he knew better than anyone—did not possess Greek culture in equal measure. After having presented the Cardinal of Nicæa, Bessarion, as *Platoni magna ratione affectissimus*—an affection, he thinks, that every judge "serious and of good sense" must approve—he does not hesitate to apply the same formula to the titular of Saint Peter in Chains: *id ipsum et de Nicolaeo Cusensi cardinale, dum viveret, Sancti Petri declaravi*.<sup>2</sup>

Among the Greeks in Italy there was frequent controversy between the devotees of Aristotle and the partisans of the Academy. In this regard Bessarion generally held conciliatory positions. However, in the same year in which the *Apuleius* of Bussi came out, he published (through the same printers) a defensive booklet entitled *In calumniatorem Platonis* against his compatriot George of Trebizond, guilty in his eyes of having accused all Platonists en bloc of "paganism." An even more sensitive point for this high ecclesiastical dignitary was that he had himself been the pupil of Gemistos Plethon, a mysterious personage whose pseudonym, as formerly that of Plotinus, already indicated a deep-seated attachment to Plato, but who pushed this cult far enough for the community of Mistra to become suspect to the orthodox, which provoked the material destruction of almost all his works. However, at the death of Plethon in 1452, Bessarion celebrated in emphatic terms this "Plato reincarnate." Many questions have been asked about the secret sentiments of the Byzantine who passed over to the Romans. Above all, let us seize on this fidelity to Mistra as the guarantee of a very intimate relationship with Plato—a guarantee strong enough for Ficino in 1484 in the preface to the *Plato latinus* to connect mythically the foundation of the Academy in Florence and all his own labor with the discussion that could have taken place, more than a half century earlier, at the time of the Council of Union, between Cosimo de' Medici and Gemistos Plethon. What is more surprising is to find the Cusan, thanks to his secretary, in such erudite company.

In support of his statement Bussi invokes the care that Nicholas had taken to acquire the best translations of Proclus, watching over them as over very precious treasures. In fact, at least after 1444, he had in his possession Proclus' *In Parmenidem* and *Elementatio* in the faithful medieval translation of William of Moerbeke. MS Cus. 186 and MS Cus. 195, in which these works appear (the second containing also the *Liber de causis*), carry in the margin a number of annotations in the hand of the Cusan himself, who often read and reread them and drew excerpts from them that are to be found in certain of his own treatises, notably the *De principio* of 1459 (taken to be a sermon by Lefèvre d'Étaples and, under the title of "Tu quis es?," partially published as such among the *Excitationes*). Already in 1438, as a member of the delegation sent by the papal party to win over the emperor, the patriarch and the Eastern prelates (with a view to a rapid negotiation which resulted, under the Turkish menace, in a fragile concordate considered by

the majority of the orthodox as a theological capitulation), he had brought back from Constantinople a Greek copy of the *Platonic Theology*, anticipating that Traversari would very quickly provide him with a translation. But he had to wait for twenty years to obtain from Balbo a Latin version, which also was from then on read often, reread and annotated, as MS Cus. 185 reveals.

In the previous century, confronted with a Greek manuscript of Plato, Petrarch had undergone a truly tantalizing torture. Better provided for, the Cusan possessed at an early stage, apart from the medieval translations by Aristippus of Plato (*Phaedo* and *Meno*), more recent translations done by Leonardo Bruni (*Phaedo*, *Apology*, *Crito*, and *Phaedrus*). MS Cus. 177, in which the two collections are combined, bears the sure signs of use, but less constant use than was made of the Latin texts of Proclus. In the last years of his life, when scarcely having the time to study them, the cardinal likewise had to hand the translations of the *Republic* and the *Laws* by Decembro and by George of Trebizond (MS Cus. 178 and MS Harl. 3261, which came from the library at Kues). It is probable, furthermore, that he had available late in life—although they have not been found—a version of the *Parmenides* by the same George of Trebizond (who, as one can see, was not such a fierce enemy of Plato) and of the *Letters* translated by Bruni. On the presence of the *Parmenides* among the books of the Cusan, a phrase of Bessarion in the *In calumniatorem* confirms the slightly ambiguous reference in the Letter to Paul II. Concerning the collection of Plato's *Letters*, a series of citations in the *Directio speculantis* of 1462 (chaps. 21–22) corroborates a note in MS Cus. 41, as has been pointed out by Raymond Klibansky.<sup>4</sup> Without ever ceasing to hear Plato through Proclus, it seems that in the last years of his life the cardinal read more of Plato's own works; he refers to them more often and with less imprecision.

And it is with him that he now very explicitly connects the *corpus dionysiacum*. Having available since 1443 the new translation of Traversari (in the copy that the future Nicholas V procured for him, MS Cus. 43), he confronts it, if not with the Greek text as he lets it be understood, at least with the old translations. In his *De concordantia catholica* of 1433, he was not afraid to call into question the authenticity of several decretals and, before Valla, that of the famous donation of Constantine; however, he does not seem to doubt that, despite the silence of the early Fathers, one must attribute to Paul's Athenian convert the texts belatedly made known under the name of Areopagite. But even while pointing out in passing this dependence of Dionysius in relation to the Apostle of the Gentiles (*Paulus apostolus ejusdem Dionysii magister . . .*),<sup>5</sup> he scarcely seems to refer to secrets that would have invested the author of the *Mystical Theology* with a quasi-apostolic authority. And indeed it should be noted that, if he suggests, again incidentally, a possible "sequence" from Dionysius to Proclus in the use of "apophatic" vocabulary (*Proclus . . . , Dionysium sequendo, unum et bonum, licet Plato ita primum nominaverit, de primo negat, quod penitus est ineffabile*),<sup>6</sup> in a not much earlier work—the *Tetralogus de non aliud, seu Directio speculantis* written in 1462 in which the cardinal, presented as a specialist on Dionysius, is in dis-

cussion with a Portuguese Aristotelian and those two ardent Platonists, namely Bussi and Balbo—he held it as "uncertain" that the author of the *In Parmenidem*, "certainly" later than the Areopagite, had known his works: *Proclus . . . , Dionysio Areopagita tempore posteriorem fuisse certum est. An autem Dionysii scripta viderit est incertum*.<sup>7</sup> And, in spite of a brief remark on the "laboring in vain" that Proclus imposed on himself in his *Platonic Theology* (in order to define, *ex conjecturis incertis*, the different kinds of "gods" and their relation to the sole eternal God),<sup>8</sup> rather than supposing, as Lefèvre again will, a distortion of the Dionysian tradition by pagan Neoplatonism, he explains evident doctrinal concurrences by a common fidelity to Plato: *Sicut Dionysius inquit unum quod est posterius uno simpliciter, ita et Proclus, Platonem referens, asserit*.<sup>9</sup>

The reference to the actual author of the *Parmenides*—not merely to his commentators—was very explicit as early as 1449 in the *Apologia doctae ignorantiae* in which the Cusan brings on the scene a "disciple" who is outraged by the accusations of ignorance made against his master by a professor from Heidelberg. After having evoked the precedent of Socrates, an excellent judge of his own *agnosia*, the spokesman for Nicholas cites several theorists on apophancy, notably that Avicenna who suspected, he thinks, the "coincidence" in God of the singular and the universal; but, it is to the "divine Plato" that he gives credit for the glory of having "beforehand" and "in a more perspicacious manner," "attempted to open up the way," followed by the "divine Dionysius" who "ofttimes" reproduced his words literally: *Acutius ante ipsum [Avicennam] divinus Plato in Parmenide conatus est viam pandere, quem adeo divinus Dionysius imitatus est ut saepius Platonis verba seriatim posuisse reperitur*.<sup>10</sup>

We have here, certainly, only a "straining" towards the inaccessible, but in the eyes of a researcher who always held to what he calls "conjecture" or "approximation," the attempts of Plato are sufficient example for the Areopagite—supposed, however, to be familiar with other models—to be presented straight out as his "imitator." It was not at all as a simple mode of expression that Proclus used the adverb *ἐνθέως* to define the manner in which his master discovered the "most primary principle" (*Plat. Theol.* I. 3) and to evoke, according to *Phaedrus* 238d, his "divinely inspired mouth" (I. 4). The *divinus* that Nicholas applies simultaneously to the author of the *Parmenides* and that of the *Divine Names* has not for him the full value of the *θεῖος* of Proclus (reserved for Plato and his authentic disciples, the "very perspicacious" Aristotle meriting only the adjective *δοκιμώτερος*), and finally<sup>11</sup> it will give place to a less emphatic *magnus*.

Having in his possession from the time of his early philosophic studies two Latin versions of the *Phaedo*, the Cusan doubtless had no need to await the translation of the *Platonic Theology* in order to find in it, from the first lines, the Platonic image of the "chase" (for the *ὄντος θήρα* of 66c he will only substitute a "quest for wisdom," a notion at once quite biblical and quite Pythagorean); but, it is certainly from the work of Proclus that he will borrow<sup>12</sup> the quotation from *I. Alcib.* 133b–c, on the "soul" (he adds "intellective") which, "returning into itself, can see all things and God." And the previous year, despite the restriction implied

in the word *conari*, the reference to Proclus was very explicit when the cardinal, pushing far the display of his Platonic religion, was not afraid to write, in chapter 20 of the *Directio*:

Plato autem, quem tantopere Proclus extollit tanquam deus fuerit humanatus, ad antierius semper respiciens, conatus est rerum videre substantiam ante omne nominabile. . . . Ex quo Platonem rerum substantiam seu principium in mente sua revelationis via percepisse.

But in ending the quotation here for greater effect, one might be misled. In fact, echoing Romans 1:19—where Saint Paul, on the subject of divine anger, seems to be thinking of a theophany in some sense natural—what follows evokes the diffusive movement of light, which, if it did not offer itself to view, would remain invisible:

Modo quo apostolus ad Romanos dicit se illis revelasse, quam equidem revelationem in lucis similitudine capio, quae sese per semetipsam visui inhaerit. Et aliter non videtur neque cognoscitur quam ipsa se revelat, cum sit invisibilis.

Thus, for the Cusan, was not the pupil of Socrates, rather than a prophet or a wise man, the one of all the philosophers best able to grasp the fundamental need for a truly divine gift without which human intelligence would remain blind? In such a way only can it be explained that—hunting on the *campus lucis*, the fourth ground for a fruitful quest—the “great Plato” was able to rise *de Sole ad sapientiam per similitudinem*, opening the way for the “great Dionysius” who *de igne ad Deum et de Sole ad creatorem per proprietatum similitudines quas enarrat ascendit*.<sup>13</sup>

And it is without doubt that we must interpret, in a parallel fashion, the reference (*Directio*, chap. 20) to the last lines of Plato *Letter VI* (323d)—a text of extremely doubtful authenticity (“We shall all, on condition that we truly philosophize [ἅν ὄντως φιλοσοφώμεν], come to know the god insofar as happy men can”), quite enigmatic all the same, and for which the cardinal substitutes an equivalent that better puts into relief the theme of the gift, accompanying it with a commentary directly inspired by Proclus:

Haec Plato in epistolis sic se habere perbreve exprobit. Deum ipsum dicens vigilantissime et constanter quaerenti se demum manifestare, quae Proclus quoque in Parmenidis commentariis resumit. Cum haec igitur vera supponant, animam inquit, quae quidem omnia posteriora, seipsam contemplant, in se animaliter complicat, ut vivo in speculo inspicere quae ejus participant vitam, et per ipsam vivunt vitaliterque subsistunt. Et quia illa in ipsa sunt, ipsa in sui similitudine sursum ascendit ad priora, quemadmodum haec Proclus in ejus recitat Theologia.

(For this last reference, compare in particular IV, 16).

But from the gracious effusion that allowed Plato such valuable insights, the last lines of the *De docta ignorantia* (III, 12)—addressed, like the Prologue, to Cardinal Cesarini—left it to be understood that Nicholas himself could have benefited. Thirteen years later, to introduce the Utopia of religious peace, he will make use of a classical procedure very dear to the Middle Ages, that of the *somnium*.

Was it simply a question of a rhetorical figure when he seemed to attribute to a celestial munificence (with the qualification, it is true, of an “I believe”) the discovery of his own method, after a series of vain efforts? Here already the diffusion of light was at the center of every work: and the citation from James 1:17 on “the Father of Lights from whom comes every excellent gift” had evidently the value of a Dionysian reference:

Accipe nunc, metuende pater, quae jamdudum attingere variis doctrinarum viis concupivi, sed prius non potui quousque in mari, me ex Graecia redeunte, credo superno dono a Patre luminum, a quo omne datum optimum, ad hoc ductus sum ut incomprehensibilia incomprehensibiliter amplecterer in docta ignorantia.

This gift received at full flood could not indeed dispense the Cusan from intensive recourse to *auctoritates*. From Anaxagoras to Cicero, from Trismegistes to Maimonides, they are numerous in the *Learned Ignorance*, and more than once distorted or modified, as can be seen notably in the way in which the author makes use of the *corpus dionysiacum*. Thus, in I, 6—where the Areopagite is celebrated as *maximus divinarum scrutator* (but have we really here an “absolute” superlative?)—the Cusan, not content to refer back, quite naturally, to *Div. Nom.* V, 8, 824a (“God cannot be this without being that, here without being there”), to *Myst. Theol.* V, 1048b (which suggests a simultaneous surpassing of the *positio* and of the *ablatio*), and to the *Ep.* I, 1065a (knowledge of the divine “transcends thought and intellection”), justifies the coincidence of the *maximum absolutum* and the *minimum absolutum* which is affirmed throughout Book I, by referring curiously to the phrase in *Myst. Theol.* I, 3, 1000b where theology is called (according to Saint Bartholomew) that which is “at once the longest and the shortest.” Citing then two phrases borrowed from *Guide for the Perplexed* (doubtless through the mediation of Eckhart who referred to it in his commentary on Exodus), he interprets a simple celebration of divine glory, in the face of which, according to Maimonides, “wisdom is only ignorance,” as if the question here was properly that of the *docta ignorantia*, “without which God cannot be found, as Dionysius, I believe, endeavored [*nisus est*] to show in many ways.”

In the following chapter Dionysius seems to be cited through Thierry of Chartres, a source not mentioned by the author but from which he certainly borrows (in I, 8) the hypothetical link between the pseudo-Greek *ontas* and the Latin *unitas*. Thinking to read in the Areopagite that our intellection of God leads *magis ad nihil quam ad aliquid*,<sup>14</sup> Nicholas transcribes the statement in his own language, according to the “rule” of what he calls here a “sacred ignorance”: *Sacra autem ignorantia me instruit hoc quod intellectui nihil videtur esse maximum incomprehensibile* (I, 17). In truth, that Cusan “Platonism” is presented in terms more Dionysian or more Proclian, that it is inspired by the school of Chartres or by Eckhart, indeed more simply by Augustine, it is so much less exclusive in that the author, from beginning to end of his work, ceaselessly affirmed a “concordance” (at least virtual) between “all the doctrines of the learned,” provided that one understands them according to the true wish of those who (more or less clumsily) were only able to enunciate them in their own way.

In the very passage of the *Directio* (chap. 20) which evokes for the benefit of Plato a *revelationis via*, while the translator of the *Platonic Theology* underlines the accord between Dionysius, Proclus, and their common master, the cardinal hastens to universalize this agreement: *Forte sapientes idem dicere voluerunt de primo rerum principio, sed varie idipsum varie expresserunt*.

In this respect the author of the *De venatione* does not appear to differentiate at all between the revealed texts and the works of the philosophers: *Sacrae literae et philosophi idem varie nominaverunt* (chap. 9). And this applies not only to the deuterocanonicals (chapters 1 and 13 refer to Ecclesiasticus as well as to Philo, supposed compiler of another "Wisdom"), but equally applies to the Pentateuch: in 1447, in the dialogue entitled *De genesi*, while his interlocutor underlines the divergences between the Mosaic recital of origins and the opinion of the *alii plerique*, Nicholas replies (without the restriction of any "perhaps"): *Qui de genesi locuti sunt idem dixerunt in variis modis*.<sup>15</sup> It remains to discover this *idem* in its various *modi*, and this quest does not proceed without serious misunderstandings. Thus, on reading Aristotle, some confuse the true *nunc aeternitatis* with that *innumerabilis duratio mundi* which raises no more doubt for the Cusan than for Eckhart. But on their side the "subtle" Platonists, if they recognize the transcendence of the *primum imparticibiliter superexaltatum*, not seeing that in him coincide *essentia et actus, actus et potentia*, indeed in a certain way *esse et non esse*, did not realize the immanence of the infinite and the theophanic value of that *innumerabilis multitudo particularium* which participates in the *idem absolutum* as much as of those particular beings *quodlibet est idem suiipsi*, in such a way that the unattainable shines forth "more clearly" in the universe.<sup>16</sup> The difficulty is not less when it is a question of sacred texts. There again for want of referring to the *intentio scribentis* (the great exegetic rule already so dear to Abelard), one is prevented from discovering the truth—beneath the "human mode" of the biblical narrative, with the contradictions and even the "absurdities" that literal readings of it imply—discerned, up to a certain point, only by the *prudenter philosophi* and those whom Nicholas, preferring almost always the comparative to the superlative, designates rather vaguely as *in theologicis peritiores*. The apparent paradox here is that—according to the symbolic teaching on the fall that the Bible narrative contains—to aspire *sua vi in scientia Deo coaequari*, man falls into that form of ignorance which is only the death of the intellect.<sup>17</sup>

That is why, proudly modest, the Cusan pretends many times that his sole project would be to bring to light (as through spectacles, declares the *De beryllo* of 1458) the "arcane" which Plato hinted at when he dared to explore the *campus* of the *non aliud* (the third hunting ground of the *De venatione*, after the *docta ignorantia* and the *possest*), producing from his discovery a "brief" and "timid" survey, in order above all to "stimulate the very subtle minds with much."<sup>18</sup> It was a matter then for his successors, not indeed to achieve the unachievable, but to participate in a great collective work, without excluding the contribution of discredited thinkers like Protagoras, who were not wrong in recognizing in man a *mensura rerum*,<sup>19</sup> or like Epicurus, to whom Nicholas (misled by a fault in his

manuscript of the Latin translation of Diogenes Laertius, and holding especially to the critique in the *Letter to Herodotus* concerning the pagan gods considered as subordinate guides) attributes the merit of having doubted that so many stars that populate the vast world should have been at the service of our little terrestrial region (*ad finem huius terreni mundi*).<sup>20</sup>

But, astonishing above all is the apparent vanity of so many, sometimes unusual, *auctoritates*, if it is true (as the Cusan also states), that the most simple artisan—a maker of spoons on the Roman forum, he who called himself *idiota* (simply a private individual, in contrast to the *orator* and the *philosophus*)—can by his own powers decipher the "book of the world" and listen to the voice of wisdom which "cries out in the public places";<sup>21</sup> moreover, he does this not by drawing on some traditional treasure of accumulated experiences but by a precise analysis of the operations familiar to the merchants. This statement is illustrated, with different degrees of complexity, by the four dialogues of 1450: *De sapientia* I and II, *De mente*, and *De staticis experimentis*. In this last text—contemporary with *Transmutationes geometricae* and an early version of *Quadratura circuli*—the author boldly lends to the would-be "profane" the anticipation of very ingenious "mental experiments" founded on a universalized use of scales that would enable all bodies to be "weighed," including those that one supposes to be "light" (such as inhaled air and exhaled air), in order to establish a complete repertory of their properties by a quantification of all scientific knowledge.

With this wonderful confidence in the virtues of what Descartes would call good sense, the cardinal evokes the Socratic-Platonic origins of chapter 13 of the *De venatione*, with reference to the tenth hunting ground—that of *ordo*—when he states that the *puer Menon* [*sic*], questioned "according to order," replied correctly *ad cuncta geometrica* [*sic*]. But it must be seen what ambitious project should finally be served by a method so facile and at the same time so difficult: the establishment of a human community founded on conciliation between beliefs. Of this hope the canonist of Basel outlined as early as 1433, in the *De concordantia catholica*, some useful preliminaries, recalling that, following the most ancient traditions, the pope is nothing more, on three levels (the diocese of Rome, the patriarchate of the West, the universal Church), than the *primus inter pares*. Rallying to the sovereign pontiff, but without renouncing his ideal of "universal concordance," Nicholas, in 1452, at the time of his negotiations with the Hussites, specifies the conditions of every compromise: a possible and, indeed, even desirable variety of rites and customs, but a fundamental requirement of unity. However, the following year—while the fall of Constantinople indicated the failure of the precarious accord between Greeks and Latins proclaimed at Florence in 1439—the Cusan, in the *De pace fidei*, "dreams" of an extension of the religious "peace" through an agreement in dogma (the blending of many liturgical, sacramental, and linguistic concessions) with the Arabs and the Turks, the Tartars and the Indians. This project was returned to in 1461 (at a more limited and less utopian level) when the cardinal was writing his *Cribratio Alchorani* at the very moment when the Ottoman army was advancing along the Danube and when the

humanist Pius II—after having offered the sultan as wages for a hypothetical conversion the derisory crown of the fallen Byzantine Basileus—prepared (quietly) for a very anachronistic crusade.

For the Cusan, it is not on the force of arms that the *pax fidei* can depend, but rather on a common reflection concerning the real content of differing creeds. While Ficino will assign himself as his first task the demonstration—by “reasons” borrowed above all from the Platonists—of the divine origin and the immortality of the soul (preambles without which Christian dogmas would remain, he thinks, inaccessible not only to readers of Lucretius—he, himself, in his youth was for some time an admirer of the *De natura rerum*—but to all those who interpret the Aristotelian noetic in the deceptive light of Alexander or of Averroës), the Cusan project is of another kind: it aims at discerning in all the doctrines of all times and of all countries, provided one knows how to extract their most profound intention, the presence, at least virtual, of the two Christian doctrines of the Trinity and the Incarnation; the one understood as based on relations between unity, equality, and connection (a theme very dear to the school of Chartres), the other referred to the requirement of an effective link between the divine infinite and the cosmic indefinite (called, in the *De docta ignorantia* II, 4, *infinitum contractum seu concretum*), ■ *nexus* which finds its “major possibility” in “human nature” taken in *summo gradu et omni plenitudine* (III, 3 and 4), that is to say in Jesus, “the perfect man,” compared to a maximum polygon that forms one whole with the infinite circle in which it is inscribed, or again, according to a less mathematical vocabulary, *altissimum principiatum immediatissime principio unitum*, which, being at once active principle and passive material, could only be born *a matre sine virili semine* (III, 5).

Neither at Padua nor at Cologne had the Cusan obtained a master’s degree in the arts nor had he donned the hat of a doctor of theology. It is somewhat through his chance reading, highly eclectic, that he instructed himself in the philosophical systems. From a Neo-Kantian perspective Cassirer has emphasized the role played for Nicholas by the “constructive” work of the intellect capable of forming some sorts of working concepts. But the most characteristic trait of Cusanism is the systematic recourse to a “dialectic” of opposites (remotely derived from the *Sophist* and the *Philebus*, reactivated by the Proclian reading of the *Parmenides*, but also by certain aspects of the style of Eckhart which abounds in the paradoxes of the “yes and no” sort). As for the influence of Ockham, of which one finds many traces in his way of considering, in counterpoint to the traditional realism of the intelligible, the mental formation of “notions,” it partly determines the critical attitude of the cardinal faced with a *figura mundi* which—at least on essential points—was common to the disciples of Plato and those of Aristotle.

But there again, it is the principle of the “coincidences” (between maximum and minimum, hot and cold, rest and motion, circular and rectilinear, etc.) that allows the author of the *De docta ignorantia*, greatly exceeding the audaciousness of Parisian nominalism, to imagine a universe without assignable limits and deprived of a center; where the earth has ceased to be an immobile mass, dark and “base”; where the sun cannot be pure light and must contain, as all things do, dark

patches (not having faultless lenses, the Cusan rather supposed than affirmed the existence of “black spots”); a universe above all without a fixed point, where each observer (Nicholas hypothetically describes the ascent of an astronaut), wherever he might be, would believe himself to be at the center of the world, in such a way that one could apply to the entire cosmos—with reference to the relativity of movement—the “theological” formula of the *Liber XXIV philosophorum*, taken up again by Alain de Lille, Saint Bonaventure, and many others, on the infinite sphere whose center is everywhere and its circumference nowhere:

Machinam mundanam habere aut istam terram sensibilem aut aerem aut ignem vel aliud quodcunque pro centro fixo et immobili, variis motibus orbium consideratis, est impossibile. . . . Jam nobis manifestum est terram istam in veritate moveri, licet nobis hoc non appareat cum non apprehendimus motum nisi per quamdam comparisonem ad fixum. . . . Propter hoc, cum semper cuilibet videatur quod, sive fuerit in terra sive sole aut alia stella, quod ipse sit in centro quasi immobili, et quod alia moveantur, ille certe semper alios et alios polos sibi constitueret. . . . Unde erit machina mundi quasi habens undique centrum et nullibi circumferentiam (II, 11 and 12).

However, the cosmological revolution is less complete here than it will be in Pascal, since the author explicitly adds that the true center and the true circumference of the undefined universe is God himself, *qui est undique et nullibi*. This immanence of the infinite the Platonists suspected only of being the *anima mundi*, without quite seeing that *natura* (or *spiritus universorum*) is *tota in toto et in qualibet parte*. But the Cusan often seems to distort the idea of the “number which moves itself,” “made of the same and of the other,” in the sense of what he calls (making use of an expression that comes from Boethius) the “natural complication of all the temporal order of things.” If the Peripatetics criticize Platonism in this regard it is because they refuse the *medullaris intelligentia*, holding (perhaps without reason, *forte irrationabiliter*) to the *cortex verborum*, to a mode of expression that reifies the idea and separates it from its living source. More prudently, “a number of Christians”<sup>22</sup> have “acquiesced” to the Platonist view, understanding that in spite of some ambiguous expressions which appear to suppose “distinct reasons, posterior to God and anterior to things,” placing them sometimes in a “guiding intelligence of the spheres,” it is really a question, more or less confused, of the Word, that is, of the Son equal to the Father (II, 9).

Certain audacious consequences which the author of the *De docta ignorantia* draws from these views—the undefined character of a world which *terminus caret intra quos claudatur* (II, 11), the homogeneity between the sublunar and supralunar (the earth is a star like the others; there are probably inhabitants on the sun, II, 12)—announce a new reading of Neoplatonism (that of Giordano Bruno) that will remain, in its essentials, unknown to Ficino (for it is incidentally, and in order to praise circular movement, that he writes [*Plat. Theol.* IV, 1]: *Terra, si, ut voluit Aegiasias, moveretur, in circulum moveretur*, adding immediately that this earth, *ut volunt plurimi, manet per superficiem*, all that is heavy being heaped up around it as in the center of the world). But it must be especially emphasized that, even where the Cusan makes use of concentric circles, in order

to show the double envelopment of the sensible by the rational and of the rational by the intellectual, he corrects this schema by a figure of a quite different type, destined to show in what manner all creatures are simultaneously subject, in various degrees and fashions, to two clusters of influence, symbolized by two intersecting pyramids, corresponding to identity and difference, unity and multiplicity, light and darkness, but also, in a certain sense to God and nothingness: *Adverte quoniam Deus, qui est unitas, est basis lucis, basis vero tenebrae est nihil.*<sup>21</sup> Already, in the *De docta ignorantia* (II, 8–11), the theory of the *spiritus*—with explicit reference to ancient Stoicism—limited the hierarchical theme in suggesting an immense dynamic whole that has often been compared to the world of Leibnitz to the extent to which everything in it depends on everything and corresponds to everything (*quodlibet in quolibet*).

While preserving the terms “macrocosm” and “microcosm” (but in a universe which scarcely merits any longer the name of cosmos), Nicholas describes an undefined complex of interactions which leaves little room for astrology such as Ficino so willingly practiced. Without doubt, in the sermon *Ubi est*, delivered in 1456 on the feast of the Epiphany,<sup>22</sup> the preacher evokes with one word the sayings of Abumasar linking Judaism with Saturn, Islam with Venus, and Christianity with Mercury, but he does not attempt to define exactly the “signs” that announced the Nativity to the Magi. He prefers to take his inspiration from Eckhart’s commentary on John 1:38 (*Rabbi, ubi habitas?*) in order to expatiate upon the divine “where,” that “place of time” called eternity, “the never-ending motion” which is also “rest.” And, without evoking any astral influence, he then outlines—in the line of the myth of Protagoras taken up and adapted by Gregory of Nyssa in the *Creation of Man*—a history of humanity at first deprived, then raised up, through culture and technology, to the true religion:

Multi suo ingenio aut divina illuminatione varias artes invenerunt melius vivendi, ut qui artes mechanicas et seminandi et plantandi et negotiandi invenerunt, et alii qui politizandi et oeconomisandi regulas conscripserunt atque qui ethicam invenerunt. . . . Est deinde hiis artibus religio addita, in divina auctoritate et revelatione fundata (p. 96).

This progression has not the simplicity of a straight line. Although later than Jesus, Mohammed preached a truth that was partial and deformed. His historical mission was, however, to rescue untutored desert peoples from their superstitions and, although “deceived by the devil,” to open to them an “easy way” towards the truth.<sup>23</sup> Throughout the Koranic formulac which explicitly reject them, the cardinal thinks he finds—implicit—Christian dogmas which, in their secret hearts, the best educated Muslims probably profess. Much more than the majority of his contemporaries, Nicholas foresees the spread of the inhabited earth and the variety of civilizations. (In the last book of *De concordantia* he already emphasizes them in relation to the Roman Empire which, contrary to the view supported by Dante, cannot lay claim to universality.) In spite of all the misfortunes of an age that does not encourage optimism (he, himself, struggles for years against the Duke of Tyrol and clashes, in his diocese of Brixen, with a section of his clergy), he seems

to believe in progress. Not only can one better observe phenomena, spectacles are manufactured, printing is invented, but the cult of idols is regressing and the dream of a *pax fidei* corresponds certainly to what Ernst Bloch—inspired by the words of the Cusan—will call a *docta spes*.

It has been seen that among the thinkers who participated in the collective work, if Dionysius is at times presented as *cunctis acutior*,<sup>24</sup> Plato remains to the end the one who could see *aliquid plus aliis philosophis* (chap. 12), but in the same late text in which Nicholas confirms this advantage, showing himself all the more eirenic in that his recent reading of the *Vitae philosophorum* has notably enriched his information, he makes a very honorable place for Thales and for Anaxagoras, as well as for the Stoics, but still more for the *acutissimus Aristoteles* who is praised for having defined logic as the “most exact instrument” for the “pursuit as much for the true as for the conceivably true” (chap. 1), for having established a ternary theory of the syllogism analogically applicable to the *divinum opificium* (chap. 5), for being the one who, while limiting (in an erroneous manner) the action of the universal intellect to the *administratio coelestium*, was able to rise from sensible effects to the “first cause of all the causes” (chap. 8).

At the beginning of the *Learned Ignorance* (I, 1), he was already describing the Stagirite as *profundissimus* for having recognized that the radiance of daylight blinds the people of the night (following *Met.* α, I, 993b). A little later, irritated by the attacks of Wenck, he was sharply reproaching the “Aristotelian sect” for making use of the first principle which would prohibit every *ascensus ad mysticam theologiam*.<sup>25</sup> Nevertheless, in the *De mente* (chap. 13) the *idiota* learnedly expounds a theory of knowledge that holds the balance almost equally between Plato and Aristotle, moreover attributing more than one divergence to the use, in the two schools, of different vocabularies, one calling *anima mundi* what the other designates as *natura* and which is, in truth, *Deus omnia in omnibus operans* (called also *spiritus universorum*). Elsewhere<sup>26</sup> the cardinal will point out that the same first cause (unitrine as far as being efficient, formal, and final; another figure of the three divine Persons) is designated by the master of the Academy as *unum et bonum*, whereas the founder of the Lyceum presents it as *ens entium*—a formula so much more acceptable in that, according to the *Directio* (chap. 18), one of the major merits of Aristotle is to have stated that being is that which is “always sought and always in question” (*Met.* Z, I, 1028b). The Cusan here anticipates, in a certain fashion, the exegesis of Aristotelian ontology that Pierre Aubenque will defend.<sup>27</sup>

Assuredly, the *De Beryllo* (chap. 25) underlines the error of the Stagirite when he is unwilling to admit in substance, side by side with form and matter, any more than a weak *privatio*, being unaware of the presence of a *nexus*. But in this respect it seems indeed that other thinkers went astray; the Cusan says so without mincing words: it is *omnes philosophos concordando* that Aristotle, extending in an unwarranted manner the range of application of the principle (a quite valid one) according to which contradictory judgments cannot be true at the same time, wrongly excludes from *substantia* this *tertium principium* in which coincided—according to Nicholas, in their infinitesimal degree and, so to speak, at the source

of their differentiation—"contraries" such as the *minimum calor* and the *minimum frigus* (the tendency of which to be merged can be seen in the case of burning cold), the *minima tarditas* and the *minima velocitas* (the union of which can be imagined by observing a "sleeping" teetotum). These are physical analogues, Nicholas believes, of what are, for the geometrician, at the limit where they form a unity, the *minus arcus* and the *minima chorda*. To have failed completely to grasp this was the common deficiency of searchers after wisdom, and for them it results, in Trinitarian theology, in semi-blindness. Less imprudent in this area than was Abelard, the Cusan professes in fact that even to the philosophers who spoke "with elegance" of the Father and the Word (not incarnate), this "principle of connection anterior to every duality" remained unknown, the *spiritus*, of which, the cardinal notes, no mention is made in the Gospel of John, the one to which most of the *Platonici* came closest.

In chapter 25 of the *De venatione*, making use of less radical formulae, the author notes only that "few philosophers" were aware of the *nexus unitatis et entitatis* (which *procedit ex unitate et aequalitate*), an invisible bond of love that makes all parts of the world hold together, a fire that nourishes the intelligence and alone procures for it complete happiness. Indeed it is possible that Aristotle had a presentiment of it when he defined that *intellectus penitus in actu* which turns back upon itself and *seipsum intelligit*, so producing the *delectatio summa*.<sup>30</sup> But Plato had a better inkling of it when he stated—if we are to believe Diogenes Laertius—that the "idea" is "at the same time one and multiple, stable and mobile."<sup>31</sup> It remains that properly speaking no *venator* explored through and through the ten hunting grounds listed by the Cusan. What restrained them particularly was their finitist prejudice. Most paradoxically, at least in the *Directio*—where he intends to take unto himself the Peripateticism of one of his interlocutors—it is again in the Stagirite that the author seems to recognize (apart from the merit, often emphasized, of judging *ratio* incapable of grasping *ipsam simplicissimam rerum quidditatem*; chap. 19) the implicit attribution of a *virtus infinita* to the Prime Mover, here assimilated, it is true, with the *non aliud, ante quantitatem et in omnibus omnia*, a true *forma formarum* and authentic *termini terminus* (chap. 10). On the other hand, even in the *De principio* of 1459, very closely inspired by the *In Parmenidem* of Proclus, the cardinal emphasizes the limits of a view according to which, in order to give form to the cosmos, the demiurge would have available only a finite number of notions. Not knowing the *Enneads* (in particular passages such as in V. 3, 15 or VI. 5, 9 which describe the One as a "total power" containing "infinite being and the multiple") he remains convinced that no Platonist grasped with "precision" the dyad of the two *infinitates*: the *finibilis* (called also, in other texts, *posse fieri*) and the *finiens* (or *posse facere*), the one situated *post*, the other *ante omne ens*.<sup>32</sup>

Also, even though Plato "saw better" than Aristotle the "generated" character of the world and the true role of time as an "image of eternity" (*De venatione*, chaps. 8 and 9), understanding even that man should try to become continually *Deo similior* (chap. 20), Nicholas is not at all sure that Plato grasped in its full significance (in spite of the *aliquid plus* that Nicholas accords to him some lines

later on) the *naturale desiderium* under the impulsion of which our intellect endeavors (*conatur*) ceaselessly to explore an "infinite treasure" that it rightly "rejoices" (*gaudet*) in recovering, not at all "numerable" or "comprehensible," but "inexhaustible" inasmuch as "incomprehensible" (chap. 12). As background to the homily of Pope Leo invoked here and cited (*Nemo ad cognitionem veritatis magis propinquat quam qui intelligit in rebus divinis, etiam si multum proficiat, semper sibi superesse quod quaerat*).<sup>33</sup> the Cusan brings in the tradition of *epectasis* according to the spirit of Gregory of Nyssa.<sup>34</sup> But at the same time—through his concern for human toil during this life on earth, oriented towards a better knowledge of the created and towards a lasting understanding between peoples—it seems indeed that, in language that is partly inherited from Neoplatonism, he anticipates in a certain way the "modern" option of Lessing (which will also be that of Kant, at least in its moral): the call for an "infinite endeavor" in preference to an immediate gift of complete knowledge, which belongs only to God, not to his creature.

\* \* \*

On the funeral monument erected in the sixteenth century in the cathedral in Florence, one could read of canon Marsilio that he, "the Father of Wisdom," had "restored to the light" the "Platonic dogma, through the fault of time hidden in the dust." And it is indeed like the awakening of some sleeping beauty that the Italian humanists experienced the *rinascimento*. But for Ficino it was like a sort of excavation at several levels corresponding to the historical vicissitudes of that same "dogma," each time forgotten and subsequently rediscovered.

When presenting in 1492 his translation of the *Enneads*, Ficino asserts—in a style that is dear to him—that at the beginning of 1484, when his Latin Plato was already in the press, it was the "heroic spirit" of Cosimo de' Medici (dead for twenty years) that sent him another "heroic spirit," that of the young Count de la Mirandola, inviting him to continue with his work by translating and commenting Plotinus, an intercession all the more charged with meaning in the eyes of Marsilio because Pico had first seen the light (under the same astral signs as he) in 1463 when there began at Careggi, at the urging of the Medici, the "rebirth of Plato."<sup>35</sup> In truth, being nourished above all on Aristotle, Pico came to Platonism rather as an "explorer" than as a "deserter,"<sup>36</sup> convinced moreover that between the two schools the difference must have been verbal in the majority of cases. A fortiori, he did not see any doctrinal opposition, but a development and an illustration, from the old Academy up to the final school of Athens. This was also the view of Ficino who, after having very rapidly completed his translation of Plotinus, addressed himself to the works of Porphyry and Iamblichus.

He did not believe, for all that, that the history of ancient Platonism presented a picture of a continual and harmonious flowering. As far back as 1469—the year, as we know, in which Andrea dei Bussi associated in a common eulogy the "Platonists" Bessarion and Nicholas of Cusa—the controversy between the cardinal of Nicaea and his compatriot George gave Marsilio an opportunity to retrace in broad outline the eclipses and revivals of the doctrine that must again,

with courage, be defended and promoted. Thanking Bessarion for his vigorous pamphlet, he recalls that wisdom, after having shone with a sharp brilliance in the author of the *Phaedrus* (by some "gift divine"), grew dark in his very school through the fault of too-feeble successors. In order to explain this blacking out, Saint Augustine records a tradition that Arcesilaus had deliberately concealed the Platonic truth for fear that Zeno would alter it (*Contra Acad.* III, 17–19). Proclus describes the movement by which philosophy would, so to speak, have "withdrawn into itself" (*Plat. Theol.* I, 1).<sup>37</sup> Marsilio avoids the language of the ancient mysteries, and notably the Proclian metaphor<sup>38</sup> of a "reason" that surpasses itself and then achieves, thanks to the writings of Plato, a "Bacchic ecstasy." Preferring metaphors borrowed from the practice of alchemy, he shows the manner in which the "Platonic gold," at one time tarnished, recovered its brightness, thanks to an "intense fire," at first "in the dispensary of Plotinus, then in those of Porphyry, of Iamblichus, and afterwards of Proclus."<sup>39</sup>

We are concerned then with a kind of precious treasure, constantly under threat and at times lost, but whose origin dates from the night of time. In his *proemium* to his translation of the *Poimandres* (1463), the young Marsilio goes back to Atlas, whom he imagines as a contemporary of Moses and brother of Prometheus, himself a distant ancestor of Hermes Trismegistus, held to be the founder of "theology"—a variable list which, following a tradition coming doubtless from Syrianus, will include also Orpheus, Pythagoras, and Aglaophemus. Ficino soon adds to it Zoroaster who is for him the author of the *Chaldaean Oracles* and whom Gemistos Plethon placed on the same level as the founder of the Academy.<sup>40</sup> Indeed, at the time of the *De religione christiana* (1476), the author, a priest for two years and anxious to root Platonism in the Hebraic tradition, suggests that the Iranian prophet, perhaps earlier than Hermes, could have received teachings from Cham after the Deluge, or at least have associated with Abraham. But in the introduction to his Plotinus he presents a genealogy that does not introduce any biblical authority:

Non absque providentia . . . factum est ut pia quaedam philosophia quondam et apud Persas sub Zoroastre, et apud Aegyptios sub Mercurio nasceretur, utrobique sibimet consona; nutreter deinde apud Thraces sub Orpheo atque Aglaophema; adolesceret quoque mox sub Pythagora apud Graecos et Italos; tandem vero a divo Platone consummaretur Athenis.

But before taking a place, in his turn, among the successors or the restorers of this *pia philosophia*, Marsilio Ficino (introduced to the Medici by his father, a physician who had gained their confidence) was first at Pisa the pupil of the Peripatetic Tignosi. A little later, too captivated a reader of Lucretius, he disturbed Saint Antoninus, archbishop of Florence, who thought it prudent to advise him emphatically to study the *Summa contra Gentes*. From reading this our humanist drew sufficient profit to make use, in his *Platonica Theologia*, of many Thomistic arguments, not only in what concerns the divine attributes such as infinity, unity, and intellection (II, 2–9), but even in the matter of what constitutes the very heart of the work, the *immortalitas animarum*, for it is indeed to the

Angelic Doctor that Ficino owes the reasons he invokes for refusing to the "pure forms" all other composition than that of *esse* and *essentia* (V, 7–9). Only, while he very willingly names Saint Augustine and quotes him at length (for example in XII, 5–7 where there occur extended extracts from the *De vera religione*, from the *De musica*, and from the *De trinitate*, with introductory formulae such as *Sed juvat hic cum Augustino, ut saepe solemus, paulo latius pervagari*), his borrowings from Aquinas—qualified though he was as *christianae splendor theologiae* (XVIII, 8)—often remain anonymous, and more or less masked by stylistic transpositions.<sup>41</sup> Let us add that, in all his work, Marsilio will juxtapose with the Platonic formulae elements of Aristotelian and Stoic vocabulary (and theory), a customary mixture in Neoplatonism.

That being said, it is indeed Plato that from a very early stage he declares for, even at a time when he is only reading the *Timaeus* through Chalcidius and the *Phaedrus* in the translation of Bruni, during that period of apprenticeship when, in order to work out some scholarly dissertations ambitiously entitled *De Deo* and *De anima*, he takes inspiration from Proclus in the translations of Moerbeke, collecting from Apuleius and from Boethius the fragile information in his *Platonic Institutions* presented in 1456 to Landino and to Cosimo. This text, which was not well received, was never published. From then on, while studying medicine (probably in Bologna between 1457 and 1462), Ficino set himself very seriously (and, it seems, especially through his own means) to the study of Greek, a language whose difficulties he overcame sufficiently to translate, by way of an exercise, some poems of Hesiod, the Pseudo-Orpheus, Proclus, and parts of the *Chaldaean Oracles*, highly successful attempts that he made use of for numerous quotations in his *Platonica Theologia*.

In 1463, judging him well trained for the task of which he had been dreaming for a long time, Cosimo installed him in the villa of Careggi. Having gotten his hand in with the *Poimandres*, Marsilio began to translate—and to comment on—the Plato manuscript his protector entrusted to him, the *Plut.* gr. 59, 1 of the Laurentian library, without trying to distinguish, among the *Dialogues* and the *Letters*, between the doubtful and the apocryphal. By the following year, Cosimo, an invalid close to death, was able to read Ficino's versions of the *Parmenides* and of the *Philebus*. Of the latter dialogue the guest at Careggi soon gave a public reading, matched with his comments, in a monastery that was very probably that of Santa Maria degli Angeli. To those who were astonished at this, he declared that Platonic philosophy, *tanquam sacra, legenda est in sacris*; he even added, which corresponds well with his taste for intermediary spirits, *in conspectu angelorum*.<sup>42</sup>

During the brief years of his administration of public affairs, the "gouty" Piero de' Medici took little interest in Careggi. Lorenzo, on the contrary, gave a vital stimulus to the Academy, where reigned a fervor that made it almost a sanctuary (although it still remains highly doubtful that a lamp continually burnt there in front of a bust of Plato). On the seventh of November, 1468, he who would become known as the Magnificent (he would not succeed his father until the following month, but was already enjoying great prestige) organized a solemn

repast, renewing, says Ficino (*De amore* I, 1) the tradition interrupted at the death of Porphyry. Around Bandini assembled, in addition to Marsilio and his father, the bishop of Fiesole and some companions, among them Landino and Cavalcanti. Each guest had the duty of commenting on the successive speeches that Plato has given his interlocutors in his *Symposium*. As they were recorded in the treatise *On love*, drafted by Marsilio shortly after the event, these exegetic propositions—in the style of Ficino, more homogeneous than those of the participants in the Platonic dialogue—constituted a sort of erotic philosophic mysticism, at times disparate and confused, but whose general meaning was quite indicative of Neoplatonic thought in the Florence of the Medici.

Let us say for the sake of simplicity that, according to this perspective, Eros, a very ancient god, born with Chaos and destined to fight it (I, 3), symbolizes the tendency, innate in us, towards the Beautiful, the son and splendor of the Good. To the heavenly Aphrodite, continually turned towards her father Ouranos (not Kronos as Plotinus suggested, thus substituting Intelligence for the One; III, 5, 2), corresponds the angelic intellect, identified with the second Plotinian hypostasis. The earthly Aphrodite is the Soul of the world, the power of a childbirth born at the same time of Zeus and of the *materia mundi* signified by Dione (II, 7). It is she who gives form to bodies and makes them beautiful enough to inspire lovers with such reciprocal attachments that each lives only for the other, or, to put it better, in the other (*Quotiens duo aliqui mutua se benevolentia complectuntur, iste in illo, ille in isto vivit*; II, 8). Thus Eros, son of this Aphrodite, holds together the things of heaven and those of earth, and it is from him that are born the arts, whose common principle is harmony (III, 2–3).

As for the burlesque recital of Aristophanes on the original androgyne, it must be understood of souls, not of men, and the duality that it describes concerns less the sexes than the two “lights” with which all were endowed at their creation: the one “innate,” by which they can consider what is “equal and inferior” to them, the other “infused” (at the same time reminiscence and grace), so that they may contemplate what is “superior” to them (IV, 2). Having chosen to immerse themselves in bodies, there remains in them a trace of the *splendor infusus*, in such a way that by means of the four cardinal virtues—prudence leading to strength (masculine and solar), moderation (feminine and terrestrial), justice (androgynous and lunar)—they can purify themselves, reject the arrogance of him who trusts in his own powers and thus recover, under the stimulation of beautiful forms, their *pristina integritas* (IV, 5), attaining to a beatitude that (and he also goes back to the theme of *epectasis*) Ficino conceives as an appetite that feeds tirelessly on a “spectacle always new”:

Aeternus igitur amor, quo semper in Deum afficitur animus, efficit ut Deo semper tanquam novo spectaculo gaudcat. . . . Omni expulso fastidio, suo quodam ardore oblectamentum quasi novum jugiter accendit in animo redditque illum blanda et dulci fruitione beatum (IV, 6).

One is not greatly surprised that the guests at the banquet of the Medici acknowledge an essential role for the ambiguous beings that Plato called gods,

souls of the stars, or demons, whereas Dionysius speaks rather of “angel ministers of God,” but in this connection, thinks Benci, commenting on the speech of Socrates, *inter Platonem et Dionysium verborum potius est quam sententiae discrepatio* (VI, 3). By whatever name we call them, these messengers had originally, according to the qualities proper to the seven planets, transmitted to the souls “enveloped in a heavenly and luminous body” and descending towards the earth through the Milky Way and the constellation of Cancer, seven gifts which (as they are listed in the *De amore* VI, 4—*contemplationis acumen, gubernandi potestas, animositas, claritas sensuum, amoris ardor, interpretandi subtilitas, and foecunditas generandi*) scarcely correspond to the seven munificences of the Holy Spirit, and which moreover, especially the last three, quite “honorable” though they be because of their divine origin, creatures too often misuse. Let us add that the “demons” act in general according to the humors and temperaments of the bodies in which the souls are bogged down. Improving upon the Platonic distinctions, Benci enumerates, for example, three *venerei demones*, of which the first (the progeny of the heavenly Aphrodite) reserves its weapons for the choleric, the second (sent by the common Aphrodite) attacks rather the sanguine, and the third (coming from the planet Venus) prefers to aim its arrows at the phlegmatic (VI, 5).

These mediating powers taken together constitute the third level of a hierarchy on four levels, rising from the body to God: the major difference between the two intermediate degrees is that the *angeli mens*, which is called stable, total, and continuous, grasps things in an instant and in a global fashion (*uno aeternitatis puncto simul intelligit omnia*), whereas the *anima* is bound, by nature, to discursiveness and temporality, which is why Plato accords it an “ipsomotricity” that Aristotle misjudged, believing that it meant that the soul confers its movement on itself (VI, 15). In other passages Ficino and his spokesmen hold to a ternary order, that of *Letter II* (312c), evoking the beings of “second” and “third” rank which “gravitate around the King of the universe,” but the *theologus Antonius* (none less than the bishop of Fiesole), who comments on the speech attributed to Pausanias, curiously assimilates this ternary order to a supposedly Zoroastrian triad (Ormuzd, Mithra, Ahriman), deprived of all dualist inner depth and merged in fact with the Plotinian hierarchy (*Deus-Mens-Anima* II, 4—compare the almost identical formulae of *Plat. Theol.* IV, 1). When Benci, on the subject of Eros the “magician” (*Symposium*, 203d), evokes in his turn the Iranian prophet, declaring (VI, 10) that for the same reason as Socrates he was “by nature” the “friend of demons” (as distinct from Apollonius of Tyana and Porphyry who owed to their sole “veneration” for these intermediary beings the privilege of magic powers), it is evident that only angels or favorable geniuses are in question.

Throughout the work, neither Plotinus nor Proclus is mentioned by name; they remain merged into the community of the *Platonici*, although Ficino notes certain divergences between them, notably concerning the existence of *mali demones*, evoked in a quite incidental fashion (VI, 4), but on which, he says, “certain Platonists” and the “Christian theologians” are in agreement. Several times he cites Ovid, Virgil, and even Lucretius (true, it is to describe certain aberrations of love, VII, 5 and 7). He happens in passing to invoke the authority

of Aristotle, but as a *physicus*, on the subject of the "black bile" of those who, like Socrates or Sappho, seem *ad amandi artem propensissimi* (VI. 9), or of the supposed "spiritual vapor" that would escape through the eyes and, with women during the menstrual period, would be laden with droplets of blood capable of tarnishing their mirror (VIII. 4). In the *De amore*, conceived first and foremost as a *Commentarium in Convivium Platonis*, Christianity is placed, in a sort of a way, between parentheses, but the Trinitarian allusion (confirmed in the margin by a note by Marsilio and by the very title of the chapter, *Quomodo agenda sunt gratiae Spiritus Sancti qui nos ad hanc disputationem illuminavit atque accendit*) is not without significance right at the end of the book, when Cavalcanti, having expounded and explained, in the manner of Ficino, the speech of Alcibiades, in order in some way to make Him propitious, invokes "God whole and entire"—Power, Wisdom, and Love—that is Father, Son, and Holy Spirit (and not, as Marcel inexactly translates it, the power and the wisdom of Love):

Nos autem amorem hunc adeo nobis propitium ea mente colimus et veneremus sapientiam et potentiam admiremur, ut, amore duce, totum, ut ita loquar, Deum habeamus propitium, ac totum amoris flagrantia diligentes, toto etiam amore perpetuo perfruamur (VII. 17).

Dated July 1469—some months before the *Letter to Bessarion* on the vicissitudes of Platonism—this commentary, in a tone at times peculiar and which was the basis of several malicious interpretations, was not to be published until 1484, two years after the *Platonica Theologia de immortalitate animarum* (completed, it seems, by 1474). In the meantime appeared two short works with the significant titles, *Concordantia Mosis et Platonis* and *Confirmatio christianorum per socratica*. Braccio Martello, to whom these texts are addressed, is disturbed by the position that "demons" hold in them. Ficino replies by invoking the double testimony of Plotinus and of Porphyry confirming that of Origen, in such a way that *non Plato solum, verum etiam Platonici cum nostra religione consentiant*.<sup>43</sup> Already in 1474 it was prompted by such a certitude that, under the guarantee of Lorenzo, he had decided to receive the sacrament of Holy Orders, thus attaining to a status which indeed, through the game of ecclesiastical benefices, assured him leisure for work, but which above all was to enable him (as he declares in the foreword of *De christiana religione*) to combine *philosophandi studium* with *pietatis officium*.

In pursuing his Platonist work, he thus considers that he was fulfilling his priestly vocation. His *Plotinus* completed, he translates several Neoplatonic texts, notably of Iamblichus, Porphyry, and Proclus, and then, as if in the same burst of enthusiasm, the *Divine Names* and the *Mystical Theology*. After which the Areopagite—qualified as *Platoniorum procul dubio summus*<sup>44</sup>—brings him back so to speak to the legendary sources of the *corpus dionysiacum*. From 1497 onward, grown old and disillusioned by the drama of Savonarola, which for him was not a very brilliant episode, he undertakes a commentary of the Pauline epistles which will not go beyond the first five chapters of Romans. For this work he is closely

inspired by Aquinas, but—as has been seen with reference to several pages of the *Platonica theologia*—to make his own certain Thomistic arguments was not to break with a fundamental attachment to the "Platonic dogma." The epitaph drawn up by his colleagues by no means indicates that he had ever renounced the *Atticum decus* of which they congratulate him on having made a gift to his fatherland.

It seems that he remained faithful to the positions that he defended, for example, in 1492, against his friend Pico who deplored the attachment of Marsilio to astrology, preferring for his part to find support for his Christianity in the Cabbala, more easily reconcilable, he thought, with free will and the "dignity" of man (but this was not at all the view of his Roman censors). Ficino, at the beginning of his commentary on the *Parmenides*, counters with a general criticism of anyone who, neglecting the opinion of Proclus, wishes to reduce the divine dialogue to an exercise in logic. Disregarding the primacy of the Good and the One over Being, the author of the *De ente et uno* makes a concession to the Parisian (i.e., scholastic) style that Marsilio deems unacceptable. The following year, replying to the *Adversus astrologiam divinatricem* by the same Pico, he agreed that one must understand the astral signs in a "poetic" and "symbolic" sense, but would not concede anything on the essential points of his convictions.<sup>45</sup>

The role that "Platonic theology" properly plays in an apologetic quite different from that of Proclus remains to be determined. Dedicating his great work to Lorenzo—he who knew how to unite, as the author of the *Republic* wished, *philosophia* with *summa in rebus publicis auctoritas*—Ficino recognizes in Plato the merit that the Cusan pointed out in analogous terms of having understood that, just as the sun is visible only by its own diffusion, we know God only through the light that he confers on us:

Plato, philosophorum pater, magnanime Laurenti, cum intelligeret quemadmodum se habet visus ad Solis lumen, ita se habere mentes omnes ad Deum, ideoque eas nihil unquam sine Dei lumine posse cognoscere. . . .

Thus all his philosophy—moral and dialectic, physical and mathematical—constitutes a "theology" and, since the consciousness of self, as Saint Augustine well saw, is the first condition of our accession to illumination, it is first proper to establish the divine character of the *mens creata*.

This undertaking is all the more necessary in that, in ever greater numbers, *perversa ingenia* challenge the authority of the faith. To those who had complained of his supposed "rationalism," Abelard objected that without arguments from reason, one can have scarcely any effect on subtle opponents. That is also the opinion of Ficino, convinced that Providence has very precisely entrusted him with the task of reviving the "Platonic reasons," most capable in his eyes of affecting the ungodly. His friend Pannonius, a humanist bishop but one who scarcely appreciates familiarity with geniuses and belief in celestial signs, suggests in a letter that the *renovatio antiquorum*, attributed by Marsilio to a happy planetary conjuncture, could be more "fortuitous" than "providential" and could depend less on "religion" than on "curiosity." He answers him by a defense of those

superior spirits, true "ministers of God," of which the astral figures signify only (without determining them) the benevolent actions toward the *mentes humanae*, in such a way that even *fatum* is always at the service of *Providentia*.<sup>46</sup>

Already, in the foreword to the *De christiana religione*, Marsilio evoked eternal Wisdom which, since the beginning of time, has established a privileged liaison between the *divina mysteria* and the *verae sapientiae amatores*. Also, for the Persians as for the Jews, for the Indians and for the Gauls, as much in Egypt as in Ethiopia, the philosophical function was not separated from the sacerdotal dignity, so that no propagator of the *rectus cultus* could neglect the *ratio colendi*.<sup>47</sup> Ficino reproaches the Christians of his time with a double ignorance, that of the clerics whose religion is often pure superstition, and that of the philosophers who fail to recognize the only way capable of leading them to religion: hence this appeal addressed to the one and to the other: *Hortor igitur omnes atque precor philosophos quidem ut religionem vel capessant penitus vel attingant, sacerdotes autem legitime sapientiae studiis diligenter incumbant*. The Letter to Pannonius specifies it; these stubborn philosophers, for whom religion is an old wives' tale, are none other than the disciples of Alexander of Aphrodisias and Averroes, those who betraying Aristotle (*adversus Averroem graeca Aristotelis verba reclamant*; *Plat. Theol.* XV, 1) proclaim the human intellect either mortal like the body or common to all individuals.

Thus Ficino rediscovers the same enemies as Petrarch and one can see better the direction of his Platonism. Indeed he exonerates the Stagirite from the blasphemies that are erroneously shielded by his authority; he even attributes arguments to him on occasion (referring, for example, to his *Metaphysics* as to the existence of a multiplicity of angelic directors charged with moving the heavenly spheres; *Plat. Theol.* I, 5), but he judges his philosophy, even essentially, as much less "religious" than that of Plato, less apt therefore to serve as a propaedeutic *ad perfectam religionem*, that is, as the best of all those that constitute the genus of the *religio communis*. The *acuta ingenia* are nourished voluntarily on philosophic food, but if they receive the *exca philosophica* of a *philosophus religiosus* such as Plato, while they believe themselves to be philosophizing, they are already impregnating themselves with religion, which leads them more easily *ad meliorem religionis speciem sub genere comprahensam*. While awaiting the miracles that Providence, as it did in the time of the apostles, will doubtless not be slow to instigate in order that the specific character of the true faith may be made manifest, Ficino accomplishes a work of piety, since to make better known "the divine Plato and the great Plotinus" is to confirm *ratione philosophica ipsum religionis genus*.<sup>48</sup>

It might be thought that, in a certain way, by a "transsumption" of Cusan-type, Platonism as Ficino understands it, transcends itself to be merged at the upper limit into the truth common to all religions, that of Christianity, of course. This idea is not perhaps totally unknown to Marsilio who—to use the formulae in which Raymond Klibansky sees a possible echo of the *De pace fidei*—acclaims the variety of rites as a *mirabilis decor*, the sign of a providential will (*De christiana religione*, chap. 4). But the *religio communis* that he envisages, at one

of the decisive stages of his argument, resembles rather a natural religion (although more poetical and magical than rationalistic). His essential aim is to throw the fullest light on the divinity and on the immortality of the soul. If it is true that the divine attributes demonstrable by means of *ratio philosophica* extend to the providential care of all creatures (*Plat. Theol.* II, 13), which does not at all exclude, as we know, the essential place left for the angels and demons (without forgetting heroes and geniuses), the "common religion" under its Platonic form—that of the wise man who "treats divinely of heavenly things" while Aristotle "speaks naturally of divine things"<sup>49</sup>—only indirectly (or in a premonitory fashion) makes way for the great Christian dogmas of the Trinity, Incarnation, and Redemption. Indeed Socrates, in his acceptance of unjust death, in the manner in which he came out of himself to converse with his *daimôn*, can pass, not for an *aemulus*, but for a *defensor* of Christ (that is, a pagan precursor parallel to the just men of the Old Testament<sup>50</sup>). And, in the *Concordia*, where Marsilio takes up again the same terms as Numenius, Plato appears quite like "another Moses," who has a presentiment of the creation, the fault of men expelled from a sort of earthly paradise (the Atlantis of the *Critias*!), the punishment of the wicked in another world, and even the veiled announcement of a *sacratior aliquis quam homo* coming to earth in order "to open up the sources of truth, finally followed by all."<sup>51</sup> It remains that nothing of all that can take the place of faith in Christ as it is revealed only by the *perfecta religio*.<sup>52</sup> In this regard the later texts that multiply the formulae of prudence do not lack continuity with the earlier works, to which moreover they willingly refer. In the same letter to a Dominican in which he suggests that Platonists such as Plotinus (pupil of the Christian Ammonius Saccas) or Proclus were able to read with profit the Gospel of John and the Dionysian writings, Ficino, in 1495, refers explicitly to what he wrote to Braccio Martello, that is, to his *Concordia* itself.<sup>53</sup> He could have evoked much earlier declarations, for example those in the *De religione christiana* (chaps. 8, 13, 23, etc.), as to the superiority of the apostle over the most subtle philosophers.

Let us add that, in this reading of Platonism, despite certain allusions to falls and punishments, the accent is scarcely placed on the resistance that the demiurgic work comes up against, nor on the indomitable aspect of certain forms of malice. Marsilio is the resolute opponent of all forms of gnosis or Gnostic tendency (cf. notably *Plat. Theol.* II, 2). On the other hand he emphasizes the teeming life "everywhere present," which makes him indulgent towards the idea of a World Soul.<sup>54</sup>

If he invokes in passing the unlucky influx of Venus, particularly fearful when Saturn is opposed to the sun (for example, *De amore* IV, 4 and VII, 10–11), it pleases him to put confidence in Jupiter to counteract the misdeeds of Saturn (VI, 4–17). Despite his morose temperament (and a melancholy against which the *De triplici vita* of 1489 presents many remedies—dietary, astrological, and even "ecological"), in general he treats with much understanding the "sympathies" between planets (for the angels who move the spheres are all children of God, ministers of the same Father, *De amore* I, 8). In any case, never could the tyranny of Necessity prevail against the dominion—more ancient—of that Eros who, as

Orpheus said, "engenders all" and, in this way, "commands the three Parcae" (*De amore* V, 10–12). Below the transcendent God, "source of unity" (*Plat. Theol.* III, 1) within the scale leading from matter to the angels, Ficino emphasizes the continuities. With what he calls the "inert mass" of bodies (only recognized by Atomists) is linked, in fact, as of itself, the "efficacious quality" (brought to light by the Stoics) that in its turn leads to the "rational soul" (which Heraclitus described), then to the "angelic intelligence," the stage at which Anaxagoras stopped, leaving to Plato the concern to designate the "divine sun" toward which must turn the *purgata acies mentis* (I, 1).

As thunderbolt and mortars can prove, bodies have more power to the extent that they are less dense, nearer to air and fire, and the most humble forms, those that need a material substratum, act only through the immanence in them of an idea coming from the *primus mundani operis architectus* (I, 2 and 3). At the same time intelligent and intelligible, the angel remains motionless, a direct reflection of the operative principle. In an intermediary position, exactly in the center of the scale, the soul, like the moon, receives its light from on high; motionless by its substance, it is mobile through its works. Between the pure corporeal multiplicity and the divine unity (with the two intermediaries of quality or united multiplicity and of the angel or multiple unity), it alone forms the link between two infinities, that of the Good and that of primary matter, which, inasmuch as it aspires to Being, already participates in goodness (I, 4–6 to III, 1–2).

With its triple function (reason, anger, and concupiscence corresponding to brain, heart, and liver), the human soul is distinguished however from the *anima mundi*, indivisible and omnipresent, populated by demons, geniuses, and heroes, *vita mundo infusa* which the Stoics erroneously confused with the *summus Deus*. Although Saint Augustine and Saint Thomas judged the question of secondary importance, Marsilio wished that a council would explicitly confirm the thesis of the *Epinomis* (983b–c) on the souls of the spheres, intermediaries between ours and the *anima mundi*, but he scarcely seemed to doubt there would be a positive response that would harmonize with his astrological views (IV, 1). On the other hand, despite the opinion of Plotinus, he did not believe that the seminal reasons were finite in number, which would impose the image of an eternal return. And if it is true that the statement of Plato on the manufacture of souls by the acolytes of the demiurge seems to accord with Ficino's taste for mediations, Ficino here—not being afraid to invoke equally the authority of Aristotle as to the intellect coming from without (*Gen. Anim.* II, 3, 736a)—prefers the opinion of other "excellent Platonists" (Dionysius, Origen, Augustine) and asserts that, having been created *ex nihilo*, our souls owe their incorruptibility to a *virtus infinita* operating *sine medio* (V, 13 to X, 7–8). From this one can infer—Marsilio here comes close to Nicholas—that the *mens* also possesses, *quodammodo*, an "infinite virtue" thanks to which *non modo reperit infinitum actum qui Deus est, verum etiam potentiam infinitam quae est materia subdita Deo atque ad innumerabiles formas inde capiendas idonea* (VIII, 16).

Calling attention to certain disagreements between non-Christian Platonists (for example between Plotinus, on the one hand, and Porphyry and Proclus on the

other) on the immortality of irrational souls, he passes quickly on, making use of a formula (*sed haec ipsi viderint*) that means: it is their business (V, 4). Most often he believes he discerns between all the *Platonici*—Greek, Arab, and Christian—a fundamental agreement, notably on the existence of the "ethereal body" which will belong to souls inasmuch as they are incorruptible (IX, 6), but still more on the motion by which the *mens*, as *imago Dei*, turns back on itself, reflecting in some way the divine radiance, and can thus rise towards God (XII, 3–4 to XIII, 4).

In the fall of souls, Ficino—who pretends to rely at the same time on Moses and on Zoroaster, on Hermes and on Plato—see less ■ revolt than a sickness. In spite of the disorder that it produces in the cosmos, he emphasizes particularly what remains of harmony, notably those marvels of instinct that he presents as the signs of a divine presence, recognized by Saint John and Saint Paul and which the ancients symbolized by their *Jovis omnia plena* (X, 3 to XII, 1). And he extols above all that *mens humana*, constantly illuminated by the *mens divina* and which possesses an *intuitus naturalis veri* (XII, 4). Through the enthusiasm which captivates it, it can have command over beasts and things in such a way that man becomes a sort of "emulator of God in his arts and governments" (XII, 3). Describing him as the most religious of beings, Ficino seems to attribute to him the final ambition to "become all," to "do all," to "surpass all," to be "everywhere and always," to know "the supreme riches and the highest pleasure" (XIV, 2).

These are certainly rhetorical formulae rather than a statement of some Promethean wish, but the magical background remains disquieting to the extent that Ficino affirms a parallelism between three systems of determination—Providence which governs intellects, Destiny which rules over souls, Nature who is mistress of bodies—so that not only miracles, but all the spells and incantations (to use the expressions that Marsilio knew well and which soon imposed themselves on Pomponazzi) come to be written in a certain way into the *lex aeterna*. The author of the *Platonica Theologia* does not appear to doubt that this doctrine is at the same time that of Iamblichus, of Proclus, of Avicenna, and of the "Christian theologians" (XIII, 2–5). But is it enough, to assure this harmonization, to take up again arguments against materialism and against Averroism (notably in Book XV) that are partly borrowed from the Thomistic arsenal, or, finally, confronted with the eschatological problem, to invite the reader to pass beyond the philosophical circumlocutions to follow the shorter way that he is offered by the *theologici christiani* (XVIII, 8)?

Without casting doubt on the good faith of the canon of Florence, one will simply recall, among so many other signs of a mode of expression through which are revealed singular modes of feeling and of thought, the very terms of which Marsilio makes use—spontaneously and not without naïveté—when he expresses his gratitude to the archbishop of Florence, Rinaldo Orsini, the brother-in-law of Lorenzo. This prelate, in fact, made the journey to Rome to see the pope personally and to prevent an imminent condemnation of the *Apologia* published in December 1489 by the author of the *De triplici vita* who was accused of allowing too much scope to astrology in the third part of the medical work. In truth it seems

that his defense, on the contrary, aggravated his case. Saved by the representations of Orsini, he was not afraid to evoke Saturn, master of ravaging wolves, and to compare the archbishop to the beneficent planet that neutralizes inauspicious influxes:

Salve diu, salve semper, pastor bone, salus ovium. Pastor bonus animam suam ponit pro ovibus suis, ut ea et pascat et tueatur a lupis. Ita ut nuper agnum tuum Ficinum pie admodum ex voracibus luporum faucibus eruisti et Saturno jam nos graviter invadenti, tu quasi Jupiter es oppositus.<sup>39</sup>

## *Neoplatonism, the Greek Commentators, and Renaissance Aristotelianism*

EDWARD P. MAHONEY

In this paper I should like to share with my fellow students of Neoplatonism the results of researches in medieval and Renaissance Aristotelianism that have brought to light interesting ways in which Neoplatonism came to have a special impact on the development of Renaissance Aristotelianism. It is certainly not my aim to exclude other possible ways in which Neoplatonism had its effect, but I do believe that historians of ancient Neoplatonism will themselves be surprised to learn of the pervasiveness of certain themes among supposed proponents of Aristotle during the fifteenth and sixteenth centuries. The two topics on which I wish to concentrate are (1) the influence on late fifteenth- and early sixteenth-century Aristotelianism of two late ancient commentators on Aristotle, namely, Themistius (317–388) and Simplicius (*fl.* 530),<sup>1</sup> and (2) a conceptual scheme of metaphysical hierarchy whose origins are clearly Neoplatonic and which was constantly debated during the same period.

### THE GREEK COMMENTATORS THEMISTIUS AND SIMPLICIUS—AND THEIR INFLUENCE ON RENAISSANCE ARISTOTELIANISM

If we turn to the writings of two of the most famous philosophers at Padua during the fifteenth century, namely, Paul of Venice (d. 1429)<sup>2</sup> and Cajetan of Thiene (1387–1465),<sup>3</sup> we find no direct use of the writings of these Commentators in their own psychological writings. The situation is different with Nicoletto Vernia (d. 1499)<sup>4</sup> and his student, Agostino Nifo (ca. 1470–1538),<sup>5</sup> both of whom make extensive use of Themistius' paraphrases on the *De anima* in the translation of Ermolao Barbaro;<sup>6</sup> Simplicius' *Physics* and *De coelo* and the *De anima* traditionally attributed to him;<sup>7</sup> and Girolamo Donato's translation of the *De anima* of Alexander of Aphrodisias.<sup>8</sup> The work of Themistius had of course been known in the Middle Ages through the translation of William of Moerbeke, and it had played a role in the philosophical psychologies of Thomas Aquinas, Siger of Brabant, Henry Bate of Malines, and James of Viterbo, among others.<sup>9</sup>

In an early question on whether the intellective soul is united to the human body as its true substantial form, Nicoletto Vernia makes no use of the Commentators but presents a straightforward Averroist position.<sup>10</sup> However, in his *Contra perversam Averrois opinionem de unitate intellectus de animae felicitate quaestiones divinae*, finished perhaps in 1492 but only published in 1504 after Vernia's death, he makes constant use of the Greek Commentators on Aristotle, namely, Alexander, Themistius, and Simplicius, along with Albert the Great.<sup>11</sup> Although he cites both Ficino's translation of Plato and also that of Plotinus, Vernia culls his presentation of Plato's psychology from Albert, and he attributes essential elements of it to Aristotle as well as to Themistius and Simplicius. The intellective souls, which God has created from eternity, possess in themselves the forms of all intelligible things, but they no longer remember these forms after they have entered human bodies. Nonetheless, once the body is purged through study, the soul is excited to reminiscence since learning is for Plato a recollection, as Boethius also points out.<sup>12</sup> Vernia lists Themistius and Simplicius among those who hold that both Plato and Aristotle thought that intellective souls are many, have been created by God from eternity, are infused in the human body, and return to their respective stars at death, and he adds as a comment from the *De anima* attributed to Simplicius that any disagreement between the two is merely verbal.<sup>13</sup> He also quotes from Themistius' paraphrases on the *De anima* in Ermolao's translation to show that while the ancient Commentator presents a possible argument for the unity of the intellect based on the need of a teacher and student to know the same thing, he did not himself assent to such a view but rather argued against it.<sup>14</sup> Later in the treatise, Vernia reaffirms that Themistius was only presenting an argument in the text in question, and he adds that Themistius determined the problem in his comparison of the intellect to light.<sup>15</sup> What Vernia is referring to, of course, is the celebrated passage regarding illuminating and illuminated intellects, whose meaning had already been debated by philosophers in the late thirteenth

century on the basis of Moerbeke's translation.<sup>16</sup> Paraphrasing Ermolao's translation, Vernia interprets Themistius to mean that there is one illuminating intellect for all men but many illuminated intellects, just as there is one sun although light itself is divided.<sup>17</sup> He also argues on the basis of other passages from Themistius' *De anima* that the individual human intellect survives death, and he denies that Themistius intended to have Aristotle disagree with Plato regarding preexistence and recollection.<sup>18</sup>

Vernia uses both Simplicius' *Physics* and also the *De anima* attributed to him in presenting his position on the soul and the intellect.<sup>19</sup> It must be admitted that Vernia is not wholly successful in welding together the ideas that he derives from the two works.<sup>20</sup> Among the things that Vernia takes from the *Physics* are that Plato and Aristotle both believe that the presence of the agent intellect to the sense image excites the soul to the knowledge that it previously possessed,<sup>21</sup> and also that the separation of the soul from the body does not involve a motion but simply the soul ceasing to illumine (*illustrare*) and to inform (*informare*) the human body by reason of some indisposition on the part of the latter.<sup>22</sup> From the *De anima* ascribed to Simplicius, Vernia appears to derive his own interpretation of Aristotle's doctrine of the agent and potential intellects, a doctrine which he also attributes to Plato. As we have already noted, Vernia assumes that both Plato and Aristotle held to the preexistence of the individual soul, which forgets all the intelligible species it possesses as soon as it is united to the body. The three stages of the soul's cognition can be considered in either an a priori or an a posteriori ordering. According to the a priori ordering, the soul first knows itself and things above it, then it somehow descends from itself to know the intelligible species that are innate to it, and lastly it flows wholly to the outside and thereby comes to know accidents and individual things. On the other hand, according to the a posteriori ordering, the soul first knows sensible things through the imagination, and it is then aroused by other sensible things to return to the innate intelligible species that it had forgotten and is thereby made to know material things perfectly, that is, through their causes, and finally it returns to itself and there contemplates both itself and higher beings. The possible or potential intellect is the soul before it flows outside; the speculative or habitual intellect is the soul as it has gone outside and then returned to grasp its innate intelligible species; and the agent intellect is the soul as it has returned from outside and contemplates both itself and higher things.<sup>23</sup> Vernia claims to find this same threefold mode of the soul's operating in the *Liber de causis*, which he attributes to Proclus.<sup>24</sup> What is lacking in Vernia's treatise is any discussion of the two intellects that stand above the individual human intellect.<sup>25</sup> It is most important to emphasize, however, that Vernia has read Simplicius to have held that the human intellect is multiplied, that is to say, individual in each human being, since his student, Agostino Nifo, and many other philosophers during the sixteenth century will interpret Simplicius in an opposed fashion.

In his commentary on Averroes' *Destructio destructionum*, published in 1497, Nifo quotes Ficino's translation of the *Enneads*, but only late in the commentary and not to decide any major doctrinal issue.<sup>26</sup> Simplicius' *De coelo* and *Physics* are mentioned, but not the *De anima* traditionally attributed to him.<sup>27</sup> On

the other hand, in the early *De anima*, which was published in 1503, Nifo cites Alexander, Themistius, and Simplicius constantly, often showing parallels between Themistius and Simplicius, on the one side, and Plotinus, on the other side. He reads both Themistius and also Plotinus (*Enneads* I, 1, chaps. 7, 10, 12) to hold that the rational soul extends a "life" or "animation" from itself into the body, though in doing this he is being misled by the imprecision of Ermolao Barbaro's translation of Themistius. The latter often contains explanatory remarks as part of the translation itself.<sup>38</sup> In any case, Nifo's exegesis of Plotinus is clearly inspired in great part by Ficino's own commentary on the *Enneads* (I, 1, chaps. 1, 7, 8).<sup>39</sup> Nonetheless, it should be noted that Nifo himself does not present Aristotle as upholding this sort of "animation" theory, although both Ficino, who bases himself on Themistius, and Ermolao's translation of Themistius do so. Indeed, Nifo seems to have been heavily influenced by Ficino's commentary on the *Enneads* in his own analysis of Themistius' views on the relation of soul and body.

Throughout his early commentary on the *De anima*, Nifo makes constant use of the *De anima* ascribed to Simplicius. He underlines Simplicius' distinction of the soul perfecting the body as opposed to its using the body, but he appears neither to understand too well nor to emphasize sufficiently Simplicius' doctrine of the various "lives" of the soul.<sup>40</sup> Without doubt, one of the most fundamental doctrines of Simplicius is that of the three levels of intellect, which Nifo interprets as involving: (1) the unparticipated intellect—Nifo identifies this intellect with God, the first agent intellect; (2) the participated intellect, which while abiding in itself in unwavering fashion attaches the soul to itself; and, (3) lastly, the human soul and its intellect which, when it abides in itself in the unity and permanence within itself, is the actual intellect, just as it is the potential intellect as it proceeds forth to the outside.<sup>41</sup> Nifo takes the third intellect to be one for all men. While Nifo does not always interpret Simplicius' doctrine correctly, the important thing to notice is that he helped to initiate a tradition of interest in that Commentator's psychology that lasted throughout the sixteenth century among Aristotelian philosophers.<sup>42</sup> And as with Themistius, so Nifo again turns to Ficino's commentary on the *Enneads* to explicate both Simplicius and also what Simplicius attributes to Iamblichus.<sup>43</sup>

Once again in his *De intellectu*, also published in 1503, Nifo uses both Themistius and Simplicius, as well as Ficino's translation of and commentary on the *Enneads*. He claims to find in agreement Themistius, Iamblichus, and Plotinus in saying that there is one World Soul that subsists in itself but vivifies by other souls (called "lives," "animations," or "traces") all living things.<sup>44</sup> He thus believes that Thomas could not use Themistius effectively against the Averroist doctrine of the unity of the intellect, though he admits that Thomas' *De unitate intellectus contra Averroistas* contains other arguments from which the Averroists cannot escape.<sup>45</sup> It should be noted that Nifo, in clear opposition to Vernia, takes Themistius and Simplicius to hold, in agreement with Averroes, that the intellect is one in number for all men.<sup>46</sup> On the other hand, he believes that no matter what Themistius may espouse, various "Platonists" maintain the plurality of human souls—

Ammonius, Origen, Plotinus, Porphyry, Proclus, and Iamblichus—all mentioned by Ficino. From at least this point of view, the Neoplatonists support Christian belief. Nifo has here simply borrowed from Ficino yet another time.<sup>47</sup> We should also note that while Nifo realized the similarities between the Commentators, that is, Themistius and Simplicius, and Plotinus as presented by Ficino, neither he nor his fellow Aristotelians seem to have fully appreciated the Neoplatonic doctrine of the simultaneous one-and-many which provides the key to some of the ideas of these two Commentators.<sup>48</sup> We might add that Nifo's interest in the Commentators continued in his later *De immortalitate animae*, where he again interprets Themistius and Simplicius as maintaining one intellect for all men and again rejects Thomas' use of Themistius against Averroes in his *De unitate intellectus contra Averroistas*.<sup>49</sup>

The works of Themistius and Simplicius on the *De anima* continued to be cited and studied throughout the sixteenth century by such philosophers as Giulio Castellani, Marcantonio Passeri (Genoa), Giovanni Faseolo, Francesco Vimercato, Federico Pendasio, Giacomo Zabarella, Antonio Montecatino, and Francesco Piccolomini.<sup>50</sup> The writings of Themistius and Simplicius brought with them a variety of Neoplatonic doctrines that were absorbed into the mainstream of sixteenth-century Aristotelianism. The origins of this use of the Commentators must of course be traced back to the use made of Themistius' *De anima* in the Moerbeke translation during the late Middle Ages, but the new translation of the work by Ermolao Barbaro and the latter's claim that Averroes had stolen his ideas from Alexander, Themistius, and Simplicius doubtless had much to do with renewed interest in Themistius' work.<sup>51</sup> Key points of contention that these ancient Commentators engendered among Renaissance Aristotelians concerned the unity of the intellect and the personal immortality of the soul. It is surely noteworthy that on occasion both topics much exercised religious authorities during the Middle Ages and the Renaissance.<sup>52</sup>

#### A CONCEPTUAL SCHEME TO ACCOUNT FOR METAPHYSICAL HIERARCHY—ITS NEOPLATONIC ORIGINS AND ITS INFLUENCE ON RENAISSANCE ARISTOTELIANS

Throughout Proclus' *Elements of Theology* there are scattered remarks setting forth a conceptual scheme that was to have great impact on Western Christian philosophy during the Middle Ages and the Renaissance. The scheme was also introduced into the West through the writings of Proclus<sup>53</sup> and the Pseudo-Dionysius,<sup>54</sup> the *Liber de causis*,<sup>55</sup> and some passages in Augustine.<sup>56</sup> Elsewhere I have traced the history of this scheme in the writings of over twenty philosophers, ranging from Albert the Great to John Locke.<sup>57</sup> I shall sketch out here only salient aspects of the scheme and the debates that it engendered. I shall take care to show what I take to be its potential for conflict with orthodox Christian thought.

The scheme involves taking God and matter (or non-being) as two poles or termini measuring all things and thereby determining their grade or rank in the

hierarchy of reality. Spatial terms like "nearness" and "distance" play crucial roles in this scheme. The closer something is to God, the higher its grade, whereas the more it recedes from God and approaches matter (or non-being), the lower is its grade. The scheme is found in Albert the Great's commentary on the Pseudo-Dionysius' *De divinis nominibus* as well as in other of his works. The greater the falling away from the simplicity of the First Being, the greater a thing's diversity and composition. In like fashion, participation and approaching God are inter-related.<sup>48</sup> Aquinas too adopts the scheme in various of his writings, pointing out that God can be called a "measure" only by transferring the word from the category of quantity.<sup>49</sup> But what is important to emphasize is that Thomas is careful to point out that there always remains an infinite distance between God and his creatures.<sup>50</sup> That is to say, Thomas seems wary of certain aspects of the conceptual scheme. He explains in the *Summa*, for example, that things are called "distant" from God through an unlikeness of nature and grace, not through any physical distance, since God is in fact omnipresent.<sup>51</sup> The scheme is also to be found in the writings of Siger of Brabant,<sup>52</sup> Henry of Ghent,<sup>53</sup> Giles of Rome,<sup>54</sup> and Godfrey of Fontaines.<sup>55</sup> The sources used by these various medievals include the Pseudo-Dionysius' *De divinis nominibus*, the *Liber de causis*, and Proclus' own *Elements of Theology*.<sup>56</sup>

The fourteenth-century discussions regarding the "intension" and "remission" of forms had their effect on the fifteenth- and sixteenth-century developments.<sup>57</sup> Richard Swineshead's *De intensione et remissione qualitatibus* played a central role in these later discussions.<sup>58</sup> Paul of Venice (d. 1429) will admit that the grade of things in the scale of being (*latitudo entis*) can be measured from the zero grade of being (*non gradus entis*), but he denies that measurement is possible in regard to the infinite grade (*ad gradum infinitum*), that is, God. He argues for this position on the grounds that the perfection of a man is no closer to the highest goodness than that of a horse, since in each case there will be an infinite distance from the finite grade of goodness to the infinite grade.<sup>59</sup> Not surprisingly, Marsilio Ficino (1433–1499) accepts the conceptual scheme and God as the primary measure of the grades of things in the hierarchy of being. One would expect this of a philosopher who translated and studied with care Plotinus, Proclus, and the Pseudo-Dionysius, and whose favorite medieval Christian philosopher was Thomas Aquinas.<sup>60</sup> He was also acquainted with Swineshead (Suiseth) and the so-called *calculatores* tradition.<sup>61</sup> Ficino shows special concern with the problem of how God can be infinite and yet measure the gradation of his creatures.<sup>62</sup> Indeed, Ficino at times speaks as though God were the highest (*summum*) or the first grade (*gradus primus*) within the genus of all things—so too had Thomas Aquinas—but further analysis of his fascinating but tortured attempts to solve this dilemma lies outside the scope of this paper.<sup>63</sup> What surely must be added is Ficino's denunciation of "certain barbarians" (*barbari quidem*)—Paul of Venice is doubtless the prime target—who deny that things can be measured by their approach (*accessus*) to God inasmuch as he is infinite and who assert instead that things are measured solely by their receding (*recessus*) from privation.<sup>64</sup> There was also a sharp interchange between George of Trebizond and Cardinal Bessarion on the same issue.<sup>65</sup>

The debate over whether or not the measuring should be taken only from the

zero grade of being (*non gradus entis*) and not from God continued in such thinkers as Gabriele Zerbo (ca. 1435–1505),<sup>66</sup> Cardinal Domenico Grimani (1461–1523), and Pietro Pomponazzi (1462–1525), of whom only Grimani defends Swineshead's view as applied to the metaphysical hierarchy.<sup>67</sup> Pomponazzi denounces Swineshead and cites Aristotle, Averroes, Plato's *Philebus*, Ficino's *Platonic Theology*, the Pseudo-Dionysius' *De coelesti hierarchia*, and Augustine's *Confessions* (XII, 7) as authorities for the view that intension and remission are measured by approach to and receding from the highest grade of a latitude, a view that he himself accepts.<sup>68</sup> The Franciscan, Antonio Trombetta (1436–1517), accepts God alone as measuring things by their approach to or receding from him, but by omitting non-being he is simply being loyal to his intellectual master, John Duns Scotus.<sup>69</sup> In contrast, the contemporary Thomists, Thomas de Vio (1469–1534) and Jacobus Brutus, accept both God and prime matter as the measure of things, thus reasserting Thomas' view on the subject.<sup>70</sup>

The conceptual scheme of God and non-being or matter measuring the hierarchy of being, which is clearly Neoplatonic in origin, was adopted by various Renaissance philosophers who are usually identified with the Averroist tradition. In his commentary on the *Destructio destructionum* (1497), the medieval Latin translation of Averroes' *Incoherence of the Incoherence*, Agostino Nifo (ca. 1470–1538) frequently invokes the scheme in order to explicate Algazel and Averroes.<sup>71</sup> The *Liber de causis* is cited on several occasions, and Albert's and Thomas' works probably influenced him to adopt a participation metaphysics and to attribute it to Averroes.<sup>72</sup> In this and other of his works, Nifo takes Averroes to have adopted the scheme in order to explain the composition both of the Intelligences and of all other things.<sup>73</sup> Nifo's work had an impact on another so-called "Averroist," Marcantonio Zimara (1460–1532), who also attributes to Aristotle and Averroes a participation metaphysics and the conceptual scheme. However, Zimara goes beyond Nifo to seek other authorities for the scheme, not simply Augustine, but also the *De coelesti hierarchia*, the *Letters*, and the *De divinis nominibus* of Pseudo-Dionysius.<sup>74</sup> Both Zimara and Alessandro Achillini (1463–1512),<sup>75</sup> another Averroist who adopted the scheme, show special concern with the problem of how an infinite God can be said to measure things approaching to him, granted that he is always infinitely distant from them. Zimara tries to solve the dilemma by arguing that while God's perfection is formally infinite when taken in itself, it is not infinite when taken as imitable or participable by creatures.<sup>76</sup> Achillini, on the other hand, would say that only if God is finite, as Aristotle maintains, can he serve as a measure, but he also adds that he holds as the truth that the Intelligences are in fact infinitely distant from God. His solution would be, it appears, to fall back on the zero grade of being (*non gradus perfectionis entis*) as measuring the hierarchy of being.<sup>77</sup> Zimara attacks the *sophistae* and *calculatores* for just this position.<sup>78</sup>

The scheme is debated and either adopted or rejected by a variety of other sixteenth-century philosophers. For example, the Dominican Giovanni Crisostomo Javelli (ca. 1470–ca. 1538) appears to accept the scheme,<sup>79</sup> whereas Gaspare Contarini (1483–1542), one of Pomponazzi's students, makes God alone the

measure and rejects the zero grade. By means of a tortured line of reasoning, Contarini argues that God can be considered as finite as well as infinite, at least insofar as he is free of the infinity of matter and multitude—he resembles the finiteness of the number one in comparison to other numbers.<sup>80</sup> The problem of reconciling the concept of an infinite God with taking him as the measure of all things as they approach or recede from him also vexed a group of thinkers of the late sixteenth century. In his *De motu libri decem*, Francesco Buonamici clearly takes God to be such a measure or standard. He interrelates the concepts of participation, “nearness,” intension and remission, and the latitude of being.<sup>81</sup> Buonamici’s solution as to how something that is of infinite perfection, and therefore unknown to us, could enable us to understand how much each thing approaches to it appears to be that God is known by us as finite.<sup>82</sup> Galileo Galilei (1564–1642) presents arguments against measuring things by their distance or receding from God in his *Juvenilia*, and in so doing he is rejecting the view of his own teacher, Buonamici.<sup>83</sup> On the other hand, one of Galileo’s acquaintances at Pisa, Jacopo Mazzoni (1548–1598), does accept God as the measure of all other things. However, he is very concerned to answer the objection that an infinite God cannot serve as a measure. His reply, in short, is that the “closeness” and “distance” at stake mean nothing but a greater or lesser participation in infinite perfection.<sup>84</sup> Finally, Cesare Cremonini (1550–1631), Galileo’s acquaintance at Padua, rejects the scheme as presented by Nifo and Zimara, and he makes pointed criticisms against using the word “to lack” (*deficere*) of the Intelligences in comparison with God.<sup>85</sup>

In this brief survey of the fate of the conceptual scheme during the Renaissance, one constant concern has become evident, namely, how to reconcile the concept of an infinite God of orthodox Christian theology with the notion of a God who measures all grades or levels in the hierarchy of being as things approach or draw near to him according to a set “distance.” It is not surprising that some thinkers rejected that scheme as unreconcilable with the concept of an infinite God. On the other hand, it should be noted that Plotinus himself did consider God to be infinite and saw him as outside and beyond all measure, though he measured everything else.<sup>86</sup> Moreover, in contrast to Proclus, Plotinus seems eager to present God as outside any genus or even hierarchy.<sup>87</sup> Consequently, we should perhaps view the debate about the conceptual scheme as revealing not so much a conflict between Neoplatonism as such and Christian orthodoxy but rather as difficulties inherent in the hierarchical conceptions of such Neoplatonists as Proclus.<sup>88</sup> It is instructive to note that Philo and the early Church Fathers used the terminology of “enclosing, not enclosed” to bring out God’s transcendence rather than that of “infinite distance.”<sup>89</sup> In like fashion, a Church Father such as Gregory of Nyssa who knew both Plato and Neoplatonism appears to make no use of the scheme to explain metaphysical hierarchy.<sup>90</sup>

The present paper has examined two different areas in which Neoplatonism had an important influence on the course of Renaissance Aristotelianism, namely, in psychological analyses, through the writings of Themistius and Simplicius, and in the long history of discussions regarding a conceptual scheme of metaphysical hierarchy. This scheme had its roots in Proclus, with perhaps some anticipations

in Plotinus, and was known to the Christian West through the Pseudo-Dionysius, the *Liber de causis*, and Augustine, as well as through Proclus’ own *Elements of Theology*. It even had some history, though in a watered-down form, in early modern thought, but that is another story.<sup>91</sup>

# Andreas Camutius on the Concord of Plato and Aristotle with Scripture

CHARLES B. SCHMITT

The more deeply one studies the philosophical thought of Western Europe during the fifteenth, sixteenth, and early seventeenth centuries, the more it becomes apparent that there are two dominating factors at work. I say this basing myself on the very imperfect state of our knowledge of the vast philosophical literature from the period that has not yet been assimilated into the general interpretative structure found in most syntheses of the thought of the Renaissance and early modern world. I am convinced that we are still very far from plumbing the depths of Renaissance thought, and even in those very few instances (e.g., Ficino, Pico, Pomponazzi, or Bruno) where we have a substantial interpretative literature, we are still not very close to having a complete understanding of these men's thought and their definitive place in the complex of Renaissance philosophy. Indeed, in the present paper, I hope to be able to add a footnote to the *fortuna* of Pico della Mirandola and Ficino in the sixteenth century.

The two principal factors of the Renaissance that I referred to above are that: (1) the continued importance of Aristotle as the dominant philosophical influence during the Renaissance is far greater than has been realized by interpreters up to

now; and (2) the deep penetration of Neoplatonic thought in the Renaissance fabric, although generally emphasized by most interpreters at the expense of Aristotelianism, is both deeper and more widespread than generally thought. These two statements, of course, seem at first hearing to be mutually contradictory; and, so they are. They require explanation, qualification, and clarification.

Let us look at Aristotelianism first. The general interpretation of Aristotelianism found in most writers of history of philosophy and of intellectual history is that, after having had its day in the high Middle Ages, it declined rapidly in the fifteenth century to be replaced by humanism and Platonism. Recent work shows this to be patently false. In fact the real high point of Aristotelianism—quantitatively speaking—can be located in the fifteenth and sixteenth centuries. Leonardo Bruni's translations of the moral writings had few peers in terms of popularity in the fifteenth century.<sup>1</sup> Flodr's *Incunabula classicorum* shows clearly the degree to which Aristotelian editions dominated the classical revival in fifteenth-century printing:<sup>2</sup> there were 552 Aristotle editions in the fifteenth century compared to 389 of Cicero, 181 of Ovid, and 18 of Plato, to give a few illustrative examples. A similar pattern is to be found for the sixteenth century, though we are still far from having a reliable and fairly complete list of Aristotelian editions for the century.<sup>3</sup> I estimate there to be between 2000 and 3000 Aristotelian editions, commentaries, and expositions printed during the century, perhaps ten times as many as there were Platonic works. For most of the individual Aristotelian works more new Latin translations were made during the fifteenth and sixteenth centuries than during all earlier centuries combined.<sup>4</sup> There can be no doubt whatever that Aristotelian philosophy still dominated the West during the fifteenth and sixteenth centuries as much as it had done during the Middle Ages.

How then can I say that Neoplatonism also was even more influential during the Renaissance than normally supposed? Many years ago it was shown by Professor Fabro in his pioneering work that there was a far deeper penetration of Neoplatonic themes and doctrine in the thought of Thomas Aquinas than had previously been thought.<sup>5</sup> More recent research has substantiated and broadened his findings, so it is now generally accepted by all, save a few, that *Doctor Angelicus* is not necessarily equivalent to *Doctor Aristotelicus*. That is to say a very large amount of Neoplatonism went into the medieval Aristotelianism of the thirteenth and fourteenth centuries as well as of the twelfth century. What is not so well recognized yet, however, is that the same is true for the Renaissance. While many Aristotelians of the Renaissance wished to go back to the "true" Greek Aristotle—Zabarella is a good example—the interpretative framework of most Aristotelians still owed much to the Neoplatonism already present in the Middle Ages. Many aspects of medievalism were consciously removed from Renaissance Aristotelianism, ranging from linguistic formulation (e.g., *De generatione et corruptione* becomes the more classical *De ortu et interitu*)<sup>6</sup> to a rejection of fourteenth-century logic in the name of something closer to Aristotle.<sup>7</sup> Though there are many exceptions, and generalization on the matter is difficult, it is my view that the penetration of Neoplatonic themes and doctrines—in the broad syncretistic sense formulated by Ficino—became more widespread among Renaissance Aristotelians than

it had been during the Middle Ages. Not only do some of the Neoplatonic themes favored by the Greek commentators on Aristotle (who were largely of Neoplatonic persuasion) become more central,<sup>8</sup> but much Hermetic and Neopythagorean doctrine finds its way into Aristotelian writers often under the guise of *prisca theologia*, a formulation of Ficino's much favored by Renaissance Neoplatonists, but by no means spurned by self-styled Aristotelians of the period. It has taken us some time to realize the degree to which *prisca* themes are to be found in Aristotelian writers and now, even nearly thirty years after Walker formulated *prisca theologia* as a functional descriptive term,<sup>9</sup> it is usually considered to be a doctrine of Renaissance Platonists and not Aristotelians.<sup>10</sup>

The result of all this is that when one looks closely at Aristotelian writers of the Renaissance, especially if one studies particular doctrines in detail, patently Neoplatonic doctrine is very often fused with Aristotelian, Platonic philosophy frequently being put into Aristotelian language so effectively as to conceal its true paternity. The insinuation of this Neoplatonic material into the Aristotelians comes about in various ways, several of which are worth briefly mentioning. First, there is frequently a conciliatory and syncretic motive on the part of Aristotelians to assimilate Platonic materials into a synthesis. Second, a particular Aristotelian will sometimes find some Peripatetic doctrine outmoded or questionable on philosophical or other grounds and will substitute a convenient and more suitable Platonic doctrine in its place. Third, certain pseudo-Aristotelian works of decidedly Neoplatonic inspiration were accepted as genuine and gave Aristotelianism a more Neoplatonic cast than it otherwise would have had. There are various other reasons for the absorption of Neoplatonism into Aristotelianism, but further discussion would take us too far off the track.

In conclusion to these introductory comments, let me emphasize once again my view that even if Aristotelianism (or as I would prefer it, "Aristotelianisms")<sup>11</sup> dominated Renaissance philosophy to a degree hitherto seldom recognized, Neoplatonism was also lurking everywhere, even in places where one would hardly expect it. Renaissance philosophy in general can be viewed as a wide variety of different eclecticism, consisting of a nearly endless number of blends of a relatively limited number of constituents. "Eclecticism" in this sense is one of the most important contributions of the Renaissance Neoplatonic tradition stemming from Ficino. In that sense—a structural one—almost all of Renaissance philosophy can be seen as Neoplatonic.

Having made these preliminary comments, I would like to illustrate some of these ideas by a consideration of a Renaissance thinker, who, as far as I have been able to discover, has completely escaped the nets of modern students of the subject. Andrea Camuzio (Camutius) was of a distinguished family of medical men native to Italian Switzerland.<sup>12</sup> He fits into the general picture I have sketched in several different ways. In addition to writing medical works, he published various philosophical treatises that make use of Neoplatonic themes and sources, as well as Aristotelian ones; the names of Plato, Plotinus, and Pico occur frequently throughout his works. His general position, which owes much to Pico, emphasized the general philosophical agreement between Plato and Aristotle and

interpreted both to be in harmony with Scripture, as the title of his first published works brings out so clearly. This work, directed towards Cristoforo Madruzzo, the Bishop of Trent, who was to play such a key role in the forthcoming Council, consists in a preface to a disputation held in Milan in December 1541 and bears the title *In Sacrarum literarum cum Aristotele et Platone concordia praefatio*.<sup>13</sup> Not only the title, but the content of the work as well hark back to Pico's endeavor of a *pax philosophica*. Before turning to a consideration of this brief work, however, let us examine Camuzio's life and activities insofar as they can be learned from the current state of our knowledge. The necessary archival and manuscript work has not yet been done to establish the details of his life. We must, therefore, make use of the information we have, realizing that not all of it is reliable.<sup>14</sup>

Camuzio (Andreas Camutius) was the son of Francesco, himself an eminent physician,<sup>15</sup> and of a family noted in medicine from the fifteenth to the seventeenth century. He was apparently born in Lugano, though in 1557, by a special dispensation, was granted Milanese citizenship and appears later as *mediolanensis*.<sup>16</sup> Secondary literature is silent or imprecise about the date of his birth, but it must have been about 1512, since he tells us in 1541 that he was then twenty-nine years old.<sup>17</sup> His life seems to break down into three periods: one in Pavia-Milan, a second one in Vienna, and finally one in Pisa, though we also know of his presence in Rome.<sup>18</sup> His studies were at the University of Pavia,<sup>19</sup> where he began teaching prognostics in 1536 and then logic and philosophy during the next few years.<sup>20</sup> After a period of medical practice in Milan (and perhaps elsewhere), he then taught theoretical medicine again at Pavia between 1559 and 1568.<sup>21</sup> During those years he published several works and was involved in a public disputation on medical topics in 1563 with Girolamo Cardano, whose account leads us to believe that Camuzio did not come off very well:

A three-day debate was instituted at Pavia with Camuzio, to be held in public before the Senate. My opponent was silenced, on the first day, in the first proposition, even in the judgement of all my rivals who were present. Certain memorials of this same event are graven in letters on the monument to Camuzio: "This then, in truth, was known to all, that they debated not for a mere refutation of argument, but with a power which seemed unassailable." And I believe the memory of that debate lives to this day.<sup>22</sup>

Cardano wrote this in 1575 and undoubtedly it cannot be accepted entirely at face value. It may be that the clever Cardano got the best of Camuzio in debate, but it was Camuzio who published a work arguing against various *conclusiones* of Cardano, dedicating it to Danicelo Barbaro.<sup>23</sup>

In spite of his alleged failure against Cardano, Camuzio was called to Vienna to become *protophysicus* to Maximilian II.<sup>24</sup> While there he published his *De amore atque felicitate* in 1574 and dedicated it to his patron.<sup>25</sup> This work is much indebted to Ficino and the Renaissance tradition of Platonic love treatises, making particular use of Leone Ebreo. A telling passage of the letter to Maximilian clearly shows the tenor of his work:

O poor and changeable Aristotle. Truly the Christian law preaches the law of love; of the Christians I know (if you exclude the few who have understood Plato), are there none who have hitherto attempted to define love? Rightly Plato alone among the ancient philosophers ought to be marked off by the term *divinitas* and should rightly be named *divinus*, because he treated the subject of love with care and vigor.<sup>26</sup>

Two years after the publication of the *De amore* the Emperor was dead and Camuzio wrote and published a work on his fatal illness.<sup>27</sup>

According to most reference works Camuzio died in 1578 (some giving the place as Vienna, others Milan),<sup>28</sup> but he was still good for another ten years of teaching at the University of Pisa, where he was *sopraordinario* in theoretical medicine from 1577 to 1587.<sup>29</sup> He was considered a man of eminence although he incurred the wrath of several colleagues including the irascible Girolamo Borro.<sup>30</sup> Among his students may have been the young Galileo, who studied medicine there in the early 1580s.<sup>31</sup> His death would seem to have occurred in 1587.<sup>32</sup>

As we have already mentioned, Camuzio's *Praefatio* was dedicated to Bishop Madruzzo, whose taste for Platonism is well known.<sup>33</sup> It takes the form of a preface to a disputation, that is, it can be read as a work similar to Pico's *Oratio*. Indeed, perhaps the most significant influence that is evident in Camuzio's work is that of Pico. In addition to the disputation held with Cardano, we know of at least three more public disputations in which he was involved: one held at Pavia about 1536, the one we are here concerned with, which was held at Milan in 1541, and a third held at Rome in 1544.<sup>34</sup> The first of these Camuzio tells us about in his *Praefatio*. Following the example of Giovanni Pico, he attempted, at the age of twenty-four, to reconcile Plato and Aristotle in a public disputation at the University of Pavia.<sup>35</sup> Though we do not know many details of this earlier attempt to defend the doctrines of both Plato and Aristotle, it is noteworthy that Pico's impact is still evident on a young philosopher of the 1530s. In his *De humano intellectu*, published in 1564 and dedicated to Carlo Borromeo, Pico still looms large and Camuzio's consideration of the human intellect owes as much to Pico and the Platonists as to the Aristotelians.<sup>36</sup>

The *Praefatio* is a straightforward apologetic work arguing that there is no essential disagreement between Greek philosophy and sacred Scripture. Though I have not been able to identify the precise reason why he was led to write on the topic when he did, it seems clear enough that there was a certain group of contemporaries to whom the work was directed as a polemical piece. Several times he speaks of those who oppose him, once saying: "I know that my adversaries (of whom there is an especially large number at Pavia) object that it is a vile thing to mouth one's own praises."<sup>37</sup> These opponents of his are also most notably the same ones who argue that religion and philosophy are in disagreement.

There are some philosophers as well as professors of Scripture, who think that the study of philosophy, especially the Peripatetic variety, is very much in opposition to sacred theology and that the teachings of the philosophers are counter in every way to the decrees and saving commands of Christ.<sup>38</sup>

Camuzio tells us that he adhered to such an opinion before he became converted to more of a concordist position.<sup>39</sup> There are several reasons why he is opposed to ■ separation of philosophy and theology. First of all, if what the philosophers teach us is not in accord with Scripture, then they have wasted their lives in misleading us and are no more than out-and-out deceivers.<sup>40</sup> Such a state of affairs would be unthinkable for it would lead to a situation in which truth in philosophy would be falsehood in theology.<sup>41</sup>

Camuzio has no sympathy for such a "double truth" position and would prefer to follow the position of the Neoplatonists rather than the Academic Platonists.<sup>42</sup> Unwittingly perhaps, opposing the two main strands of the Platonic tradition one to another, he sets up a clear contrast between the Academic Scepticism known through Cicero and the Christian Neoplatonism epitomized by Ficino. We all know now, especially since Tigerstedt has put the matter forward in such clear terms,<sup>43</sup> that the Neoplatonic interpretation of Plato won the day during the Middle Ages and Renaissance. Camuzio is no exception to this general tendency and his Platonism is very similar to that of Ficino, even if he does not mention the Tuscan by name. The general way in which the philosophy-theology relationship is viewed is very close to that of Ficino. For example, Camuzio emphasizes that both philosophy and theology are directed towards the same end (*ad eundem finem*), and that is knowledge of God (*finis est divinae essentiae [ut philosophice dixerim] cognitio*).<sup>44</sup> Again, like Ficino, he emphasizes that ■ philosopher is capable of contemplation of the divine and that this activity is proper to him.<sup>45</sup> Perhaps his clearest statement of the ultimate agreement of philosophy and theology is the following:

The professors of sacred Scripture and of philosophy may argue against it, but I am of the opinion that the doctrines of sacred theology are in no way contrary to the teachings of Aristotle and Plato, rather they agree in all ways.<sup>46</sup>

This, however, is not to say that philosophy and theology are not distinguishable, though it is obviously a problem for one who takes Camuzio's position. Not quite formulating the position in Ficinian terms that *Philosophia et religio germanae sunt*,<sup>47</sup> he does tend to see the two as parallel paths to a knowledge of God. He emphasizes that God can be known in various ways, for example, by inspired knowledge (*alii divino tantum afflati spiritu Deum agnoscunt*)<sup>48</sup> or through knowledge of the lower world (*per naturalium rerum speculationem*).<sup>49</sup> The latter method of knowledge is a gradual one and obviously Camuzio has in mind here the stepwise progression of knowledge towards God that has characterized Christian Neoplatonism. Indeed, he attributes this method of gradual ascent to a knowledge of God specifically to Plato:

For this reason Plato has always seemed to me—in this matter, as well as in other things—to have carried out his task wisely, because he has proposed that moral reasoning has everywhere been established towards living well and happily and for the purpose of cleansing the soul of the young; next one passes through the study of natural things and hence ascends gradually to the discovery of the divine.<sup>50</sup>

The debt to Plato and to later Neoplatonists is evident throughout Camuzio's work. Although it is formulated in terms of a concord of Plato *and* Aristotle with sacred Scripture, the Platonic side of philosophy seems to dominate. It is true that much of the language is Aristotelian, but even that is infused with many specifically Platonic formulations. Forms, ideas, harmony, and mixture all play a central role in Camuzio's arguments. For example, there is a long passage on the importance of *harmonia* in the soul and the question of the proper balance of the constituent parts.<sup>51</sup> At the conclusion of the section, he states again quite clearly his preference for Plato: "In this matter Plato has always seemed to me to stand out from the others."<sup>52</sup>

It would distort the issue to assert that Camuzio was one of the chief representatives of Renaissance Neoplatonism, for obviously he is not a thinker of much originality. Moreover, his works must be seen in balance and we cannot call him a Neoplatonist, strictly speaking, as we might call Ficino, Pico, Steuco, or Patrizi a Neoplatonist. There is probably as much Aristotelianism in Camuzio as there is Platonism, but it is interesting to note how many Neoplatonic formulations can be detected beneath a somewhat Peripatetic exterior. What his education at Pavia was in the 1530s is not clear. His remarks indicate that there was a strong sceptical tendency there that tended to separate clearly philosophy from theology.<sup>53</sup> He was probably at Pavia during a transition stage when the medieval tradition of logic and natural philosophy was dying out and there was little resonance still remaining from Agrippa's short tenure there when he taught both Plato and Hermes Trismegistus.<sup>54</sup> Still, Camuzio got his eclectic and Neoplatonic ideas somewhere, but from where remains to be determined. Also remaining to be determined is what happened to some of his ideas in his later works, when the second phase of his publishing career started. After the publication of the *Praefatio* in 1541 nothing else from his pen appeared in print until 1563, when he began publishing various more substantial works divided between medicine and philosophy.<sup>55</sup>

Cassirer's contention (put forward in his book on Platonism in England)<sup>56</sup> that intellectual history must be studied in the foothills as well as the peaks can be well applied to the Neoplatonists of the Italian Renaissance. A figure such as Camuzio shows so well how influential the intellectual orientation of the Platonic Academy remained a couple of generations after the death of Pico and Ficino. Besides the more ambitious and more influential writings of Francesco Giorgio, Symphorien Champier, Francesco da Diaceto, and Agostino Steuco, among others, the spread of Neoplatonic teaching can be seen among minor figures such as Camuzio.

## MODERN THOUGHT

## *Triads and Trinity in the Poetry of Robert Browning*

ELIZABETH BIEMAN

First, a prefatory *apologia*. Of course the topic opened by the title is hubristically broad for development in one brief paper. Yet, in a literary critic called to explore the poetry of Browning before an audience interested in the interaction of Neoplatonism and Christian thought, a degree of rashness is preferable to the finesse, appropriate on other occasions, that would focus more narrowly.<sup>1</sup> Some comfort lies in the comprehensive temper of the Neoplatonic tradition, in a postlapsarian Christian consciousness of human limits, and in the robust aspiring spirit of Robert Browning that issues so candidly in his own poetic language. Heaven demands that human reach exceed the grasp, even as one acknowledges humbly that it does.

From first to last in a long and productive life Browning concerned himself with matters of psychology, theology, and epistemology: man's mind, God's mind, and exploration of the process or act of knowing that might join the two. "I have always had one lodestar," confesses the speaker of *Pauline* in 1833. "A need, a trust, a yearning after God."<sup>2</sup> More than five decades later the speaker of the prologue to *Asolando* (1889) offers his reader a hypothetical choice between a

lens that would drape the world in varied rainbow hues and one capable of revealing the naked "inmost" truth ablaze. In the poems between these years (perhaps most strikingly in *The Ring and the Book*) lie countless instances of the search for the one Truth in a world of shifting perceptions of truth; and the records of infinite moments when Truth flashes, evanescently, upon the seeker, or of starry points beyond the world of finitude where all contraries meet.

Any student of the Neoplatonic tradition will recognize, as Browning surely did, that such epiphanic moments and centers belong to the annals of mystical experience, and that the *noesis* sought, and occasionally achieved, has at least as much to do with the dynamic of a Platonic *eros* as with the ratiocinative dialectic that may be employed to begin the pattern of ascent. But too many readers of Browning, having no prior command of the perennial wisdom of the mystic, and paying insufficient attention to the poetic dialectic through which he seeks to move them to the point of initiation, have misunderstood him grievously.

All too often Browning has been characterized as a pious obscurantist, whether by sycophantic friends who see in him a saving prophet of some true religion bearing a resemblance to the one they themselves profess, or by hard-headed modernists who deplore his selling out what could have been a clear head in surrender to the promptings of his heart. This distorted opinion prevailed for half a century on the impetus it got in 1891, immediately after Browning's death, in Henry Jones' influential book, *Browning as a Philosophical and Religious Teacher*.<sup>1</sup> Few noted during that period how the vision and craft of the poet were obscured in the question-begging title.

I am far from the first to take issue with such error: it has not dominated for a few decades now, although it still finds the odd champion. But the occasion of a conference on "Neoplatonism and Christian Thought" offered the unusual course of tracing Browning's lifelong quest for God and truth through examining the triadic and trinitarian patterns so apparent in his poetry, a strategy quite appropriate to the task.<sup>4</sup>

Let us begin on the base of an argument from numerology. Man is propelled into a deep dyadic dilemma by his fall, whether it be understood as the fall of the soul into the body<sup>5</sup> or as Adam's separation from God in the primal garden. His consequent yearning turns source into goal: he longs for the world once known beyond the Platonic cave, for the Plotinian One, or for the biblical God. (Not that these are identical concepts!) He can be satisfied, however partially, only when a third term is activated to bind the separated opposites.

This truism, familiar to every Pythagorean if not to every child of Adam, led of course to the ubiquity of triadic formulations in ancient and Hellenistic philosophies. The triad can enclose a triangle, the first geometric figure in the progression generated from the monad to possess a surface, and hence the first truly visible to the senses. Thus, in the lower universe, three may be regarded as "the first *real* number."<sup>6</sup> In the *Timaeus*, Plato depicts triangles as the building blocks of the cosmos. It can, and will here, be argued that triadic thought patterns are equally ubiquitous in Browning's imaginative cosmos.

Although Browning was demonstrably familiar with the Neoplatonic tradi-

tion, especially as it manifested itself in the Renaissance,<sup>7</sup> he was at least as familiar with the triads of German idealistic thought, popular in England since the time of Coleridge. The intellectual heirs of Kant, Schelling, and Hegel are still, at some remove, heirs of Plato and the Hellenistic Neoplatonists. Triadic and dynamic thinking characterizes all periods in the tradition, but it is possible to note shifts of emphasis in the prevalent patterns.

Whereas the early Neoplatonists were concerned with a third term mediating between higher and lower, or inner and outer, poles in a dynamic eddying circuitry, Hegel characteristically visualized the third term of his triads (the synthesis) as arising logically from, but thrusting ontologically beyond, the first and second (the thesis and antithesis).<sup>8</sup> The Hegelian thinker, then, will still see, as did his forebears in the tradition, the world of becoming shot through with vital being from beyond; but his vision of a powerful forward thrust, as each synthesis becomes the thesis for a new triad, imposes an assumption of linear process or progress on his system that is radically different from prevailing assumptions in earlier idealism. The hypothetical absolute is still source and goal, but the post-Hegelian eye tends, in its preoccupation with process, to turn its gaze away from the top story in the three-storied universe derived from the ancients.

The contrast just drawn is simplistic, of course. For that reason alone it would be wrong-headed to attempt to pinpoint source or specific antecedent for elements in Browning's poetry that offer analogies to elements in the long Platonic tradition. An even stronger reason to resist any such temptation is this: pervasive as triadic patterns are in Neoplatonism, they are certainly not exclusive to it. Nor is every pattern of three to be assimilated to the Trinity in a Christian poet, as many an undergraduate has yet to learn. Thus, although such paradigms in the work of a poet as impressively learned as Browning are worth the examining, the process of exploration itself may have to serve as an answer to the questions we put.<sup>9</sup> We know better than to expect the crisp certainties sought by an earlier academic generation addicted to source-hunting; we know better than to attempt to choose Neoplatonism or Christianity as exerting exclusive domain in the Browning canon.

Disclaimer expressed, we may find nonetheless a certain clarity of insight in the realization that the world of noetic activity through which Browning's speakers seek their varieties of truth is congruent with that known to Neoplatonists of every age, and that Neoplatonists of any age would find something therein with which to feel spiritually at ease. Sometimes in the poems we find the divine forces that permeate the world of particularity discharging all differences in a mystic flash: "not a fourth sound, but a star" to quote Abt Vogler (st. VII, 4). Sometimes the moribund state of some character realized in dramatic monologue leads us to see "The central truth, Power, Wisdom, Goodness—God" (*The Ring and the Book* X, 1634) as it were by negation, in an afterimage: such is the case when the murderer, Guido, in *The Ring and the Book* characterizes himself as a bleating "shuddering sheep," helplessly judged a wolf by the shepherd, Pope Innocent, and thrust back into the hellish "quag wherein it drowns" (XI, 402, 405). Sometimes the divine creative power is best understood as that which maintains the motive thrust in an otherwise flagging human life: such in the Pope's eyes was the

helpless Pompilia's instinctive compulsion to save the life of her unborn child, the "prompting of what I call God, / And fools call Nature," that moved her "To worthily defend the trust of trusts / Life from the Ever Living" (RB X, 1073-81).

The old Pope, more than any other character in *The Ring and the Book*, may be speaking for the older Browning. He is sceptically aware that perceptions of God's truth are very limited from man's fallen perspective, yet he accepts the limitations in sanguine good faith. In this he differs strikingly from speakers who take two other stances in Browning's poetic dialectic, each typical of a phase in the sequence of poetic attempts to bridge the gaps in human experience. Representing the first phase we can see, in 1835, the young Paracelsus: like the heroes of *Pauline* and *Sordello*, the early works that bracket the long dramatic poem bearing his name, Paracelsus seeks to ascend to realms no God-fearing son of Adam should hope to reach under his own noetic power. Forced to abandon the Promethean quest, to learn his limits through years of loss and opprobrium, Paracelsus enjoys only momentary triumphs in the course of his life, and, perhaps, a liberation of vision at the point of death. He never reaches a point at which he can make the triumphant affirmation typical of the second phase in the development of the Browning canon, "See the Christ stand!" Those words are given to David in the version of "Saul" published in 1855, ten years after the first version of the poem broke off inconclusively at a point where the loving young singer was praising the heroic power of his king in an unsuccessful attempt to heal his broken life. The incarnational assertion could not be made in the poem until Browning had himself moved to another phase in his own struggle for unified vision. The impetus came, of course, as the intensity of Elizabeth Barrett Browning's Christian faith augmented the residue of Christian fervor the youthful Browning had absorbed under his mother's influence.<sup>10</sup> Once experienced in maturity, the unifying incarnational vision remained a constant factor in his creative life. Yet after the death of his wife, it was rarely again articulated directly: the limits that life imposes on visionary certainties possess his imagination in later years more powerfully than vision itself.

Three phases, then, provide the schema by which I shall order the demonstrative portions of this essay. The differences are primarily those of emphasis. They are defined in dramatic voices expressing, first, strenuous aspirations towards the absolute Truth that is denied fallen man; second and centrally, proclamations of incarnational truth; third and last, awareness that moments of certainty are evanescent, but that the necessarily endless search for truth confers its own rewards. Although, as suggested, the concerns dominant in early, central, and late periods of the Browning canon may reflect the phases here defined, only the central phase—in which the "central Truth" is forcefully reiterated—applies directly to a limitable period in the life of the poet. The hunger for truth, and the recognition of the limits that deny it, are constants in the poetry of the lifetime.

In the early—the aspiring—phase, the focus is psychological, the vision is internal and subjective, in spite of the dramatic masks Browning assumes to protect the ego flayed by criticisms of his earliest publications. The reader's

sympathies are not denied the thwarted aspirant, but he is led to recognize the futility of man's unaided efforts. In the central phase, the focus is theological, the vision sacramental. Affirmations of God's gracious aid to man mark the poems now so strikingly that the less than careful reader may miss the omnipresent evidences of dialectical struggle undergirding the proclamations. Scepticism is never denied, but threads through the fabric of faith. As Christian language recedes over the years to incidental dramatic occurrences, the humane concerns of the Christian—truth, goodness, justice, life here and life hereafter—never recede. The focus of the last phase is epistemological, the vision still sceptical, as it first became when events forced scepticism upon the early striver. Once again, particular truths emerge through particular voices, but the voices are more numerous in the great dramatic epic of this phase, *The Ring and the Book*. Experience is more confusing. Absolute Truth is more and more shadowy, impossible to be proclaimed in single human utterance.<sup>11</sup>

The disparate voices thus necessitated speak, from first to last, in paradox and metaphor, the only linguistic vehicles available for oracular and prophetic utterance.<sup>12</sup> Only by participating in the forward thrust of the poems themselves, focusing on the voices one by one, struggling towards a possible wholeness and holiness refracted in dramatic tensions and recalcitrant language, can we hope to experience the process of indoctrination Browning has in mind for his readers.

In *Paracelsus*, a poem of voices, the young Browning is transparently sketching out his poetic paradigms; the work claims careful attention. At the outset the protagonist is striving for power—power "to comprehend the words of God / And God himself, and all God's intercourse / With the human mind" (533-535). This fierce erotic energy asserts apparently autonomous authority within him: he boasts to Festus, his friend, that the drive comes from God, that he must trust that "God / Ne'er dooms to waste the strength he deigns impart!" (345-346). He claims, in his obsession, that the power he seeks will serve mankind, but adds, "there our intercourse must end: / I never will be served by those I serve" (612-613). Appalled by this arrogance, Festus cautions "How can that course be safe which from the first / Produces carelessness to human love?" (619-620).

The dialectic of the poem is thus established: the tensions will be generated across the gap perceived in fallen existence between the poles of power and love. That Browning's aim was allegorical—to represent an inner action "instead of having recourse to an external machinery"—he explained in the preface to the first edition, later discarded.<sup>13</sup> The mind of Paracelsus, actively demonstrating the stance of power-hunger, is both theater and leading actor for the psychic drama.

Love finds two chief exemplars in the action: Festus, who lives by the warmth of human love and towards whom Paracelsus expresses what little mundane affection is given him to feel; and Aprile, an etherealized Shelleyan sort of poet, whose self-characterization as he enters the action in the second canto leaves no doubt as to his function—"I would LOVE infinitely, and be loved!" (II, 385). In spite of that "infinitely," an adverb of degree, what Aprile loves as artist are the things of earth and "every passion sprung from man" (II, 433); he would capture

them in art to the glory of their creator. Through this angelic presence, yearningly in love with the particulars of the world, Paracelsus comes to understand, if only partially, his own fault in unlovingly rejecting the world:<sup>14</sup>

Die not, Aprile! We must never part.  
Are we not halves of one dissevered world.  
Whom this strange chance unites once more? Part? Never?  
Till thou the lover, know; and I the knower  
Love—until both are saved.

(II, 633–637)

Aprile dies at the end of canto II.

The third canto, set in the middle years of the life of the Renaissance magus, gives us a humanized Paracelsus, partially successful in the university at Basel, warmer and less abstracted towards Festus, but painfully aware that his early hopes were vain and that "The truth is just as far from [him] as ever" (III, 502). He defines

Two sorts of knowledge; one—vast, shadowy,  
Hints of the unbounded aim I once pursued;  
The other consists of many secrets, caught  
While bent on nobler prize.

(III, 923–926)

Earlier, we recall, "knowledge" for him meant knowledge of absolutes, the radiant star of his youthful obsession; at midpoint now in life the adjective he applies to his "unbounded" goal—"shadowy"—underscores the change the years have brought. He sees painfully how, by contrast, the divine intelligence "casts (man's) mind / Into immeasurable shade" (III, 1026–1027). Shadows pervade this universe of loss, from top to bottom.

His fortunes have declined further by canto IV. Even scientific "knowledge" is slipping from him. Accused of quackery, he has called in dejection for Festus. In bitterness he raves of the black arts and of poetry (IV, 588–594); but admitting that he has "no julep, as men think / To cheat the grave," he consoles himself by claiming a faith in the indestructibility of the human soul (IV, 672–676). The characterization in this canto rings true to records of the historical personality, scientifically rebellious but conservative in his philosophical and religious attitudes—too strange, perhaps, to be a typical Christian Neoplatonist of his period, but participant nonetheless in the amalgamated streams.<sup>15</sup>

The thwarted life is near its end when the final canto opens; Festus laments at the bedside of his silent friend. Paracelsus awakes in delirium, hearing Aprile's voice, and babbling of loving and knowing. Moments of apparent lucidity alternate with flashes of arrogance towards man, or of sardonic raillery at the God who has been defeated in defeating this creature.<sup>16</sup> When, still delirious, he reverts to a happier past, Festus seizes the break in the black torrent to sing an Aprilean lyric of a stream meandering through a natural world inhabited by a multitude of lovely creatures (V, 418–446). Paracelsus sighs, now calmly awake, that the "dark snake

that force may not expel / . . . glideth out to music sweet and low" [449–450]. The image, as we shall see, is a precise anticipation of a key moment in "Saul."

Reminiscing of Aprile's quest for God through love, and his own through the power of knowledge, Paracelsus comes to pronounce his own epitaph:

Let men  
Regard me, and the poet dead long ago  
Who loved too rashly; and shape forth a third  
And better-tempered spirit, warned by both.

(V, 885–888)

Then as death comes, another triadic pattern is implied in his last words:

Festus, let my hand—  
This hand, lie in your own, my own true friend!  
Aprile! Hand in hand with you, Aprile!

(V, 905–907)

But this triad (Paracelsus as the mean term between exemplars of mundane and etherial love) rounds to a circle in the theater of Paracelsus' mind, if we visualize the ambiguous lines in one possible way. By "this hand," he is perhaps not demonstrating his own, "my hand," in a semantic stutter, nor blurring Festus with Aprile in delirium, but is attempting to join the hand of Aprile, seen clearly as the veil of this world is parting, in the free hand of Festus, and then to take Aprile's free hand himself to close the loving circle. If so, at that moment Paracelsus triumphs by bridging in love, not power, the chasm his life's proud striving has failed to close, and rounding life's angular patterns into perfection.

The dynamic circuitry of love implied in this ending—love in, and beyond, this world of flesh—anticipates the incarnational visions of Browning's central phase in some senses, without doing so specifically. In lines at the original end of canto II, which Browning emphasized by expansion in the 1849 edition that made the incarnational suggestion explicit, Aprile voiced this insight at point of death:

I see now, God is the perfect poet,  
Who in his person acts his own creations.

(II, 648–649)

To a reader cognizant of the root meaning of "poet" and the Logos tradition in the ancient world, this came close to proclaiming the Christ, even before the expansion. The dying Aprile continued, chiding Paracelsus for the idolatrous intensity of his expressed need—and the words place him far beyond the world of flesh at this point in the fiction:

Crown me? I am not one of you!  
'Tis he, the king, you seek. I am not one.

(II, 658–659)

More ethereal always, in his allegorical role, than the incarnate king, Aprile can speak and teach of love but is lacking in power to save. Paracelsus at his own

death will call upon *men* to "shape forth [the] third" who will join the human functions expressed by knower and lover, intellectual and intuitional halves of divided humanity. But it has been given the poet of the two to hint that the saving action must come from God.

The dyadic dilemma has been expressed as operating in more than one dimension in *Paracelsus*: horizontally in the division between the two who strive for the power of forbidden knowledge and for infinite love; vertically, in the gap separating them from the creator-source who is their goal. In canto V, at the end, where Aprile is part of the eternal world of love, the vertical dimension predominates.

Power and love are opposed once again in the figures of Saul and David in the early version of "Saul," published four years before the incarnational addition to *Paracelsus*. In lonely agony, like a heavy "king-serpent," the afflicted Saul hangs motionless against a great "cross-support" in his tent (29, 31). The young singer David seeks in love to release him and restore his failed power. The song to which he progresses in the ninth stanza might have been sung by Aprile; it celebrates the same particular beauties of creation, the same passions of men. David's finale, the finale to the early version, is tonally triumphant—"The name rings—King Saul!" (96). But the narrative action is inconclusive. The image of transfixed flesh at the beginning of the poem has implied the ending Browning was presumably incapable of writing in 1845.<sup>17</sup>

Not until stanza X, the first of those published ten years later,<sup>18</sup> is Saul released to full awareness, as the dying Paracelsus had been released in response to the song Festus sang in Aprilian celebration. Yet full salvation in the poem comes not for Saul but for the young poet who will see power and love fused in the vision of Christ. The serpent image does not apply directly to Saul in the second half of the poem, yet it enters once more in the culminating lines as David makes his breathless way home through a night charged with angelic and demonic presences. Armed by his vision of Christ, he feels the fears that could beset him subside harmlessly—"the Hand still impelled me at once and supported, suppressed / All the tumult" (321–322)—and in the consequent hush he sees a serpent slide away silent, under "the new Law" of love. (The serpent image, harmless now or even benign, will be noted again in another incarnational context.)

Any tendency to see the atemporal vision of David as a pious anachronism, or as the facile imposition of a metaphysical solution upon a physical problem, should be forestalled by attention to the hand imagery in "Saul." The breakthrough whereby David sees the loving potency of Christ as the inevitable answer for a fallen and separated world comes in response to an affectionate gesture from the king, whose hand tilts the boy's head back for an intense interchange of gaze. The rush of love David then feels brings in the rush of truth. If he, mere work of God's hand, would give new life to Saul "had love but the warrant" (236), could creature possibly surpass creator in this? Love has a warrant, when love is God's, because love is a power, and grants "power to believe." "All's one gift," a dynamic process in which "all's love, yet all's law" (288, 289, 242). Ecstatically, David proclaims a truth the Neoplatonist might define as the circuitry of procession from, and return to, the lodestar, God:

As Thy love is discovered almighty, almighty be proved  
Thy power, that exists with and for it, of being Beloved!  
(305–306)

David then moves on to explicitly Christian utterance:

O Saul, it shall be  
A Face like my face that receives thee; a Man like to me.  
Thou shalt love and be loved by, for ever: a Hand like this hand  
Shall throw open the gates of new life to thee! See the Christ stand!  
(309–312)

David's prophetic vision is of the mediator who alone, in the Christian understanding of things, can rejoin what the fall has put asunder. And his mystical knowledge is typical of two modes of biblical "knowing"—it is felt as received from beyond but is not contrary to reason; and it is carnal knowledge too. Hands of flesh are needed to participate in the preparation for, and realization of, God's now accessible truth.

The vision of Christ in the completed "Saul" is the strongest direct declaration of its sort in the canon, direct in the sense that there is no dialectical qualification in the poetic context, although, of course, the words are dramatically distanced from Browning by ascription to David. Thereafter the incarnational "central truth" remains a given whenever Browning writes of the human dilemma. The drier tones that ensue when he explores the epistemological concerns dominant in the final phase, the inevitable resumption of sceptical ratiocination, must not be taken as evidence of denial of the peak of vision. "Infinite moments" are not susceptible of perpetuation in a finite world; to understand this is not to deny infinity.

While Browning was working his way toward the vision in "Saul" he wrote, in 1850, a long discursive double work, "Christmas Eve and Easter Day." The work is not totally successful as poetry: it reads as recall of a dialectical struggle internal to some consciousness—perhaps Browning's, perhaps by intent his reader's—punctuated by fleeting instances of more visionary mental events.

The dialectic between power and love is modified and complicated in the first and more poetic half: the speaker observes and explores his responses to the events of Christmas Eve in three imagined settings: an unlovely service in a dreary nonconformist chapel, an imposingly ritualistic service in Saint Peter's at Rome, and a lecture on Christology at Göttingen by a professor steeped in the arguments of the higher criticism. The binding thread, as the wanderer makes his imagined survey of these manifestations of contemporary response to the Christmas event, is the fleeting figure of Christ, whose flying garments serve to "suck" the speaker

along in the flying wake  
Of the luminous water-snake.  
(503–504)

These striking lines occur first in stanza IX as the poet is being led from the chapel to Rome, and again, in precise repetition, as he is led to Göttingen. But

they have been anticipated—in brightness, in fluidity, and in the serpentine detail—in the denouement to the most mystical passage in the poem, one beginning in stanza VII and describing the vision triggered by the sight of a “moon-rainbow, vast and perfect / From heaven to heaven extending” when a “black cloud-barricade was riven” (378, 385–386):<sup>19</sup>

I felt my brain  
Gutted with the glory, blazing  
Throughout its whole mass, over and under  
Until at length it burst asunder  
And out of it bodily there streamed,  
The too-much glory, as it seemed,  
Passing from out me to the ground,  
Then palely serpentine round  
Into the dark with mazy error.

## VIII

All at once I looked up with terror.  
He was there.  
He Himself with His human air.

(421–432)

The passage is logically and emotionally ambivalent. Although the vision has begun above in the moon-rainbow, “mazy error” suggests a resumption of scepticism; and the word “gutted” begins a line of suggestion that the physical brain of the speaker (note “mass”) is womb for the birth of the Christmas vision. But it demonstrates a clear advance towards specifically Christian statement when compared with the unbinding of the dark snake’s coils at the end of *Paracelsus*; and the “serpentine” image leads here to the sudden appearance of Christ, a Christ recognizable in the very midst of doubt and terror.

The vision of the flying Christ compels compliance in the poet, but not unthinking compliance. He debates strenuously with himself throughout the whole experience, striving to find “one way, our chief / Best way of worship” so that he might “contrive / My fellows also take their share!” (1170–1174). Once he reaches a point of recognition that

I can but testify  
God’s care for me—no more, can I—  
It is but for myself I *know*  
(1185–1187, italics added)

He feels the enfolding warmth of the flying robe, and then a passionate impulse to spring “out of the wandering world of rain, / Into the little chapel again” (1236–1237).

He is still fully aware of its ugliness. But having tested and rejected the power of the professor’s searching intellect through a succinct and witty parody of the arguments by which the continental critics of Scripture were reducing the “Myth

of Christ” to “vacuity”: and having earlier “feast[ed] his love” on the palpable beauties of Saint Peter’s, he makes the existential choice: “I choose here!” (859, 914, 737, 1341). Having chosen, he participates freely in singing

The last five verses of the third section  
Of the seventeenth hymn in Whitfield’s Collection.  
To conclude with the doxology.

(1357–1359)

The search for the universal answer has been silently dropped. The glory has faded. But the particular man has taken his stand in the dry particularity lightly mocked in lines just quoted. This nonconformism may be “an earthen vessel”: but for him it holds more accessible treasure than the “golden ewer” (1313–1314) of Rome, or the empty bell jar at Göttingen—both of which stand, he has made evident at an earlier point of transition,<sup>20</sup> for the dis severed halves of love and power.

“But for myself I *know*”: affirmation and scepticism have become inseparably entwined in the fabric of “Christmas Eve.” Knowledge has been identified with, and more importantly, conferred in, the existentially chosen Way, in this record of dialectical growth. In the process of knowing, the act of choice is all important.<sup>21</sup>

“How very hard it is to be / A Christian!” This opening exclamation of “Easter Day,” separated from the “doxology” by merely the title of the second part, serves as much as retrospective commentary as it serves to sound the renewed theme. It is not always easy to “Praise Father, Son, and Holy Ghost.”

“The whole, or chief / Of difficulties, is belief” (29–30), asserts the sceptical voice in the ensuing dialogue. Then suddenly the God of power appears in apocalyptic vision to stand in judgment over the quaking sceptic. When he sees by the light of that “One fire” (505) that knowledge of the things of earth must fail, the appellant prays for love, and reverberations of Roman 7:24 and 1 Corinthians 13:8 soften those of the book of Revelation.

Thou Love of God! . . . . .  
. . . . . leave me not tied  
To this despair, this corpse-like bride!  
. . . . .

## XXXII

Then did the Form expand, expand—  
I knew Him through the dread disguise,  
As the whole God within His eyes  
Embraced me.

(992–1007)

The God of judging power, when known, is known to be loving too. The wholeness here finds expression in an embracing image that does not burst, although consciousness fades with the vision.

Power, love, and the knowledge that unites the dyadic poles through visionary experience and existential response, these terms of the Browning triad may be fitted now to the persons of the Trinity, although the danger of overschematizing must be resisted. The Father, the creator and judge, is shown forth usually in Power; the Son, also creative and standard of all true judgment, is shown forth usually in Love; but the third "person" is more elusive. This spirit is Knowledge, but not that forbidden sort sought at first by Paracelsus. Knowledge, given in pentecostal brilliance, communicable in the tongues of poetry, may be tenuously sustained by the choice that brings comforting strength. The way, the truth, the life may be willfully embraced as the visible Christ fades in the distance.

Once it is recognized that the ongoing searching and testing of knowledge has, in the Browning scheme of things, the force of the Holy Ghost in more traditional creeds, the epistemological concerns that dominate the final phase may be understood in perspective. They are the interim tasting, and testing, along the way, of the fruit that may only be assimilated in the New Jerusalem where knowledge and the fullness of life are one.<sup>22</sup> The final phase in no way, then, need be seen as marked by a falling off from faith. As the terrain through which the fallen quester must make his way, doubt was even in 1855 for Browning the very testing ground of faith. The Childe Roland who, after his dread passage, could sound his slughorn still, had more courage by far than to sell out his head to his heart or to abandon his quest. His successors in the canon can do no less.

Saint John, the disciple Jesus loved, speaks from a powerful intellect in "A Death in the Desert" (*Dramatis Personae* 1864), offering Browning's "most closely reasoned *apologia* for Christianity."<sup>23</sup>

I saw the power; I see the Love, once weak  
Resume the Power; and in this word "I see,"  
Lo . . . the Spirit of both.

(221-223)

John, on his deathbed, recognizing that his temporal witness will pass with his temporal life, and that the poetic record of his vision on Patmos may not serve all subsequent purposes, proceeds to argue that finite reason is not violated by the truth, but, as agent, is incapable of comprehending the truth. He establishes his argument on his doctrine of three souls in one (82-104), which bears an imprecise analogy to orthodox formulations concerning the Trinity, a stronger resemblance to the description of the tripartite soul in *The Republic* and Augustine's adaptations thereof, and an even closer resemblance to the doctrine Milton's Raphael owes to Plotinus and Plato as he instructs Adam in *Paradise Lost*.<sup>24</sup> John's lowest soul, "what Does," parallels Plato's vegetative soul; his median soul, which "feeleth, thinketh, willeth" in an Augustinian subtriad, is seated in the brain; and "duly tending upward" it seeks to grow into "the last soul," the one that returns to God. Once that last soul, the "what Is," has been achieved, the finite man "ends . . . in that dread point of intercourse." He has, hypothetically, grown into Godhead, and hence into the world beyond death. Like the Lazarus of "An Epistle to Karshish,"

such a man can no longer be of this earth. This is why, in God's infinite wisdom, the Knowledge beyond knowledge must remain beyond man's sustained experience.

"Caliban upon Setebos," a poem from the same volume, strikes a sceptical note that also chimes with Neoplatonic doctrine. The negative theology of Dionysian mysticism is grotesquely but movingly suggested through the words of the beast-man as he struggles through the early steps of an argument from "natural theology."<sup>25</sup> Setebos, the god worshiped by Caliban's dam Sycorax, is a gross parody of modern man's "rational" anthropomorphic projections. Setebos is a brutish sadist, a Caliban writ large. But over him, the craven Caliban hopes wistfully, rules the hidden God, "the Quiet," who may, "some strange day . . . catch . . . Setebos" (281-282). This natural eschatology fades as soon as it is articulated: Caliban sinks back into propitiating whine. Yet an interesting triad has been suggested: worshiper, projected god, and unknowable overgod. Browning probably derived his conception of "the overgod" most immediately through Unitarian friends in his youth. Nonetheless, its remoter ancestry is Neoplatonic. Caliban's god, "the Quiet," anticipates the mystical dimensions of the discourse of the Pope, which forms the climax, Book X, of Browning's great endeavor of the late sixties, *The Ring and the Book*.

The Pope is a highly rational and humane man, engaged in his own dramatic quest for truth. His epistemological concerns set him securely in Browning's final phase. The Pope speaks of two kinds of truth, parallel to the "two sorts of knowledge" Paracelsus defined for Festus. As one who must judge the final appeal in a complex murder case, his immediate concern is with the truth he must "evolv[e] at last / Painfully" from "these dismalest of documents," the records of Guido's trial.

Truth, nowhere, lies yet everywhere in these—  
Not absolute in a portion, yet  
Evolvable from the whole, [he must trust].

(229-230)

"Mankind is ignorant, a man am I" (258-259), he muses, yet if he exercises his God-given judging faculty in good faith, he will be able to face Guido's ghost without fear, confident he has attained as much truth as "We men, in our degree, may know" here. But not so "There," (377-378) at "God's judgment bar" (348). There, "He, the Truth, is, too, / The Word" (376-377). The standard of absolute truth is Christ.

The Pope sees that unless, in life, "the true way" is lit by "the great glow" of faith (1816) man's movement towards eternal truth is fearfully difficult. Only at times of mortal trial, as "When in the way stood Nero's cross and stake" (1833), is true progress possible. More often "We fools dance thro' the cornfield of this life" in "ignoble confidence" (1838, 1848). The Pope's mind opens ahead to times that will "shake / This torpor of assurance from our creed" (1854), and wonders whether the Molinists currently under threat of death for heresy, recognize

truths, obedient to some truth  
 Unrecognized yet, but perceptible?—  
 Correct the portrait by the living face,  
 Man's God, by God's God in the heart of man?  
 (1871–1874)

The words of Innocent XII, no mystic himself as Browning draws him, link the Molinists to the visions in "Christmas Eve and Easter Day" and "Saul," the standards for existential faith in the world of doubt as the middle phase yields to the third. The Pope's sympathy towards the Molinists, first demonstrated in the first book, is juxtaposed in this second expression with his musings on the enhanced probability of finding truth at points of mortal transition.<sup>26</sup>

When he does finally pass the judgment on Guido, he does so with the prayer that "suddenness of fate" may open the wretch's soul to salvation:

may the truth be flashed out by one blow,  
 And Guido see, one instant, and be saved.  
 (2127–2128)

The prayer evokes John's argument that the "last soul" truly knows at the "dread point" of death. Not inconsistently, then, the Pope seems to rest his own trust in his now-secure judgment on his own impending death:

I may die this very night:  
 And how should I dare die, this man let live?  
 (2133–2134)

In the meantime, the forward thrust of living dominates the poetry of the poet's final phase. The hunger for truth that has been evident from the outset seeks, in the recognition of limits, satisfaction through discerning the evidences of God in the particulars of this world.

Unanswerable questions still trouble Browning: he ponders, for instance, arguments for and against a belief in immortality in the little volume *La Saisiaz: The Two Poets of Croisic* which was prompted by the death of a dear friend in 1877. There the poetic imagination, the "fancy" as scoffers would have it, provides truths answerable to felt need as it transmutes the hard facts of existence into truths larger than the earthly sort defined by Paracelsus and the Pope.<sup>27</sup>

A decade later yet, in the prologue to the *Asolando* volume published the day of his death, Browning is still playing variations on the themes of epistemology using "fact" and "fancy" as key notes.<sup>28</sup> "The Poet's age is sad": the first words mark the poem as personal although three voices speak its lines. The first voice laments the passing of the colors projected upon the world in youth by the "soul's iris-bow," and brought there, for one remembering Wordsworth's great ode, from the preexistent beyond. An unmasked voice responds, setting up an opposition between the effects of a lens capable of restoring such coloration, and one that would reveal "truth ablaze, / Not falsehood's fancy-haze." The apparently straightforward words are full of evocative trickery. The imagery triggers memories of

"the rainbow [that] comes and goes," and also of Shelley's "dome of many-colored glass" casting its stained light on the world Platonists learn to regard as illusory, the world Victorian empiricists would call "factual." Once the reader adapts to the wavering perspectives, he realizes that a claim of exclusive truth for either lens would be quite false.

Reminiscing in tune with the opening voice the poet recalls the time, in his youth, when he found the town of Asolo "palpably fire-clothed." Now he sees Italy's "rare / O'er-running beauty" still—"But flame? The Bush is bare." Again the perspectives demand attention. Focusing one way we think of Moses, a young Moses, before a bush that like Asolo was "palpably fire-clothed," from which spoke the voice of God. The first response is to see the divine as immediate in the glowing vision. But the "palpable" fire may be a material screen, benignly protecting mere man from the "too much glory" of a hidden God. Then, from this other perspective, when "the bush is bare" the barriers to human perception of God's presence in his creation seem to be going down as the glories perceived in youth subside.

"What then?" the poet asks. From out of "Hill, vale, tree, flower" speaks ■ third voice, uttering a command Aprile would have been lovingly ready to obey:

"Call my works thy friends!  
 At Nature dost thou shrink amazed?  
 God is it who transcends."

The words are far from one-dimensional, but one message comes clear. God can still speak through a nature that aging eyes have shrunk from as deficient—or too powerful. The world of the many does reveal the one Truth.

The epilogue to the same volume—thus, accidentally, the epilogue to a life—paints a forthright, almost blustery picture of the poet in dialogue from beyond the grave with some "you" who loved him in life. He had well-founded misgivings about publishing it—it has met with much disapproval. "It almost looks like bragging," he told his sister and daughter-in-law, "But it's the simple truth; and as it's truth it shall stand."<sup>29</sup> This is the self-portrait designed to forestall any possible pity at the end of a life:

One who never turned his back but marched breast forward,  
 Never doubted clouds would break,  
 Never dreamed, though right were worsted, wrong would triumph.  
 Held we fall to rise, are baffled to fight better,  
 Sleep to wake.

Anyone who finds this "blustery yea-saying . . . little more than rhetoric," and untrue at that since "doubt and occasional despair run like counterpoint to his cheerfulness through all these later years"<sup>30</sup> is failing to take into account the primacy for Browning, ever since "Christmas Eve," of the act of choice. (He is in the company of most Christians in the Pauline, Augustinian, and existentialist tradition, of course, in making will an agency in bridging the dyadic gap.) Choosing the "here" of the existence he has been given, choosing to march "breast forward"

on the Way, not in denial or even in spite of doubt, but exulting in the challenge to overcome it—this is an unabashed declaration of courage. It is also the best way discovered by one particular poet and man to move towards truth. In Christian terms, it is the continuing incorporation of, and response to, the dynamic gift of the Spirit.

No, at noonday in the bustle of man's worktime  
Greet the unseen with a cheer!  
Bid him forward, breast and back as either should be,  
"Strive and thrive!" cry "Speed,—fight on, fare ever  
There as here."

The call to the living friend, "Greet the unseen with a cheer," is an exhortation, of course, to participation in the sort of "muscular Christianity" that left Browning open always to sneers from the genteel. But it is more than that. Until the boundaries of life are passed, "the unseen" must mean something Other to the human. In the imagined present tense of this "epilogue," "the unseen" is the speaker, seeing himself—to quote from another often strenuous Christian poet—now "made God's music."<sup>11</sup> Since the participant in glory is Browning, the tune must be an up-tempo march.

The vision of this last stanza crases even the qualitative boundaries between the "here" and the "there." Since Browning's existential faith has long been invested in his knowledge of the Way as the divine *persona* available to his grasping, he imagines that the nearer he comes to the real presence, the more exhilarating will be the demands upon him. Process and growth cannot possibly be seen to cease at "that dread point of intercourse";<sup>12</sup> they are his way of knowing God, his means of grace. Only an Hegelian heaven can attract this latter-day Neoplatonic saint.

In brief recapitulation, triadic patterns of thought mark Browning's poetry in all of its phases, and in the middle phase the median term between searching man and his God becomes specifically the Christ. The Trinity, as patristic tradition conceived it, is harder to recognize in Browning's characteristic patterns: Father and Son are abundantly clear, the Father dominating as distant goal for the Paracelsian aspirant of the first phase, and Christ the mediator standing clear to the visionary of the central phase. When, in the final phase, the vision has faded, the commitment it has occasioned and the taste it has conferred draw the *man* along his existential way. The impetus to the Way, the Truth, the Life has been the pentecostal gift; many tongues henceforth are needed in the poetry to weave out of partial truths the holy fabric of Truth.

## 17

# *The Christian Platonism of C. S. Lewis, J. R. R. Tolkien, and Charles Williams*

MARY CARMAN ROSE

C. S. Lewis, J. R. R. Tolkien, and Charles Williams have had a great deal of attention as writers of fiction and poetry. In addition, Lewis is widely known as an apologist for the Christian faith and for his medieval studies; Williams' *Descent of the Dove* is accepted as a significant history of the Christian church;<sup>1</sup> and, Tolkien's professional work centered on Anglo-Saxon philology and literature. It has not been sufficiently recognized, however, that all three wrote as Christian Platonists. In what follows I wish to examine the Christian Platonism that informs their literary creativity. I will (1) provide evidence that these writers wished to be identified as Christian Platonists; (2) characterize Christian Platonism as it is used in this context and draw attention to some of the Christian Platonist elements in the literary work of these writers; and (3) state some conclusions pertaining to the philosophical importance of this resurgence of Christian Platonism at the present time.

1. The establishing that Lewis, Tolkien, and Williams wished to be identified as Christian Platonists requires, first, drawing attention to their Christian faith and, moreover, to the orthodoxy of that faith and, second, establishing their

deliberate choice of Platonist concepts and beliefs for the development and illumination of Christian beliefs.

That all three intended to write as Christians is clear. In *Surprised by Joy* Lewis tells of his conversion experience.<sup>2</sup> In seven novels Williams explores the relation of Christianity to pagan gnostic, Jewish, and Muslim beliefs, practices, and mysticism. Also, Williams' *Taliessen through Logres* and *Descent of the Dove* express his Christian convictions.<sup>3</sup> Tolkien's "On Fairy-Stories" reveals the import for all his work of the explicitly Christian meaning he gives to what he sees as the important concepts of subcreativity and eucatastrophe.<sup>4</sup>

The thoroughgoing exploration of the Christian orthodoxy of these writers would require an extended study, including, of course, an examination of the meanings that history gives to "Christian orthodoxy" itself. Suffice it to say here that each writer has in one way or another declared himself to be a Trinitarian with no desire to demythologize the Incarnation or the Atonement. Further, no one of the three displays any tendency toward limited theism, the secularization of Christianity, or any form of Manichaeism. These points need not be argued in the case of Lewis whose orthodoxy is explicit in his theological works, while Williams states his orthodoxy in *The Descent of the Dove*.

The task of establishing Tolkien's Christian orthodoxy is more complex and presents an interesting challenge in which his concepts of subcreativity and eucatastrophe are of central importance. Tolkien's view is that to be faithful to his role as subcreator, man must work within the limits of objective truth that he did not himself create. Further, this objective truth possesses its correlative beauty, while the role of the subcreator is to be the faithful steward of truth and beauty wherever he finds them. The permanent role of steward given to man implies that man has a permanent relation to a master. This relation is not compatible with any secularized interpretation of Christianity which puts emphasis on man as independent. Further, Tolkien calls the resurrection the most important eucatastrophe.<sup>5</sup> (Additional exploration of this topic lies outside the scope of this paper.) I suggest, however, that any attempt to interpret the works of these three writers as informed by any view except that of Christian orthodoxy must result in a reductive, distorted view of them.

It is clear that Lewis and Williams wish to be known as Christian Platonists. In the *Chronicles of Narnia* one of Lewis' most spiritually developed and wise characters is Lord Digory.<sup>6</sup> The following is an account of his response to the passing of the physical world of Narnia:

"That was not the real Narnia. That had a beginning and an end. It was only a shadow or a copy of the real Narnia, which has always been here and always will be here; just as our own world. England and all, is only a shadow or copy of something in Aslan's real world. You need not mourn over Narnia, Lucy. All of the old Narnia that mattered, all the dear creatures, have been drawn into the real Narnia. . . . And of course it is different; as different as a real thing is from a shadow or as waking life is from a dream." His voice stirred everyone like a trumpet as he spoke these words: but when he added under his breath "It's all in Plato, all in Plato. Bless me! What do they teach them at these schools?" the older ones laughed.<sup>7</sup>

Williams' *The Place of the Lion* relates the spiritual awakening of Damaris Tighe, a graduate student in philosophy doing a dissertation on medieval Platonism without realizing the intellectual and spiritual import of the texts she studies. Anthony, like Lewis' Lord Digory, is a spiritual leader in his community. Anthony loves Damaris and reflects on her thus:

She would go on thoughtfully playing with the dead pictures of ideas, with names and philosophies. Plato and Pythagoras and Anselm and Abelard, Athens and Alexandria and Paris, not knowing that the living existences to which seers and saints had looked were already in movement to avenge themselves on her. "O you sweet blasphemer!" Anthony moaned, "Can't you wake?" Gnostic traditions, medieval rituals, Aeons and Archangels—they were cards she was playing in her own game. But she didn't know, she didn't understand. It wasn't her fault; it was the fault of her time, her culture, her education—the pseudo-knowledge that affected all the learned, the pseudo-skepticism that infected all the unlearned, in an age of pretense, and she was only pretending as everybody else did in this lost and imbecile century.<sup>8</sup>

Also, in his preface to *Essays Presented to Charles Williams*, Lewis warns against the error of taking Williams' novels as only exciting fantasies. Lewis says that Williams' novels present

some of the most important things Williams had to say. They have, I think, been little understood. The frank supernaturalism and the frankly bloodcurdling episodes have deceived readers who were accustomed to seeing such "machines" used as toys and who supposed that what was serious must be naturalistic.<sup>9</sup>

Also, Lewis expresses himself on the importance of Damaris' discovery of the reality of the archetypes:

And the frivolously academic who "do research" into archetypal ideas without suspecting that these were ever anything more than raw material for doctorate theses, may one day awake, like Damaris, to find that they are infinitely mistaken.<sup>10</sup>

The demonstration that Platonist convictions inform Tolkien's creativity is another matter. As a vehicle for Christian Platonism, the fiction of Lewis and Williams offers idealized situations that are not only consistent with the truth of Christian Platonism, but are to be expected if that position is true. Anyone who lived through these situations and who possessed sufficient spiritual preparation would have some experiences that would count as verification of the truth of Christian Platonism. Tolkien, on the other hand, has created a culture which, like Heidegger's *Dasein*, does not impel toward any one interpretation of reality and man, but rather is suggestive of many interpretations. Thus, while a Christian Platonist interpretation of *The Lord of the Rings* and of Tolkien's short stories is consistent with the content of these works, it is not explicitly stated by their author.<sup>11</sup> All doubts about Tolkien's Christian Platonist interpretation of Middle Earth are dispelled, however, with the posthumous appearance of *The Silmarillion*, the first two chapters of which provide an obviously Christian Platonist account of creation.<sup>12</sup> Here the divine creator puts into creation an axiological orientation toward harmony. The act of creation is accompanied by the beauty of song, and

the product of this song is a metaphysically fundamental locus of beauty in the harmonious relations between creation and creator and among the various aspects of creation. The harmony is broken by the disobedience of one of the Valar, creatures analogous to the angels of the pseudo-Dionysius and to whom some of the work of creation is entrusted.

2. Platonism, Neoplatonism, and Christian Platonism are, of course, equivocal. What meanings is it legitimate and fruitful to give them in this context? And do they have the same meanings for Lewis, Williams, and Tolkien? I will try to show that there is ground for answering this latter question in the affirmative. Further, in my opinion the Christian Platonist elements shared by these three writers are too numerous to examine exhaustively in this context. I will discuss three of these elements: the reality and availability of suprasensory aspects of creation; the modes of our coming to know these aspects of creation; and the ideal copresence of truth, beauty, and goodness in all aspects of creation. I have chosen these for emphasis because I wish to show that these are of great import for the comprehension of the intention and content of the work of these three authors and also for present and future philosophical and theological creativity based on their work.

We have noted Lewis' acceptance of the reality of the archetypal realm. His *eldila*, or angels, which are of central importance in his Trilogy, are not perceptible to physical sight or hearing, though when they choose they can make themselves seen and heard by earth dwellers. The hero of the Trilogy is Elwin Ransom who sees and converses with the *eldila*:

The faces surprised him very much. Nothing less like the "angel" of popular art could well be imagined. The rich variety, the hint of undeveloped possibilities, which make the interest of human faces were entirely absent.<sup>11</sup>

And in Christian Platonist fashion the *eldila* have work to do in respect to the physical world. One *eldil* tells Ransom of the former's relation to the human inhabitants of *Perelandra*:

I was not sent to rule them, but while they were young I ruled all else. I rounded this ball when it first arose . . . The beasts that sing and the beasts that fly and all that swims on my breast and all that creeps and tunnels within me has been mine.<sup>12</sup>

Williams' character Anthony is given a vision of the archetypal realm that he immediately recognizes for what it is:

Patterned upon the darkness he saw the forms—the strength of the lion and the subtlety of the crowned serpent, the loveliness of the butterfly and the swiftness of the horse—and other shapes whose meaning he did not understand. They were there only as he passed, hints and expressions of lasting things, but not by such mortal types did the Divine Ones exist in their own blessedness. He knew, and submitted; this world was not yet open to him, nor was his service upon earth completed. And as he adored those beautiful, serene, and terrible manifestations, they vanished from around him.<sup>13</sup>

One theme of *The Place of the Lion* is the development of Plato's conception of participation.<sup>16</sup> Williams writes of Anthony's knowledge of the archetypes in physical objects:

He knew them in the spiritual intellect, and beheld by their fashioned material bodies the mercy which hid in matter the else overwhelming ardours; man was not yet capable of naked vision.<sup>17</sup>

Likewise, we have noted the importance Tolkien gives to the Valar who are analogous to Lewis' *eldila*.

All three writers see the suprasensory realm as knowable, but not by intellectual means alone. On this topic, however, there is a fundamental difference between the views of Lewis, Tolkien, and Williams, on the one hand, and, on the other hand, those of Plato as expressed in Socrates' speech in the *Symposium*; of Plotinus; and of the Jewish Platonist writers of the *Zohar*. According to all three of these last the individual who achieves direct perception of the archetypal realm of creation does so through his efforts at spiritual and intellectual development in which he is aided by a knowledgeable teacher who has walked that path of development. These efforts bring about a distinctive total maturation of the self, including the development of powers for investigation of reality. Thus, the individual becomes an instrument of metaphysical inquiry, his nature having become correlative to certain metaphysically fundamental aspects of reality.

That Lewis was cognizant of these pagan and Jewish forms of Platonist inquiry concerning suprasensory aspects of creation may be surmized from his interest in Western occultist writings, the teachings of which were in large part drawn from the *Zohar*.<sup>18</sup> And that Tolkien and Williams as well as Lewis were cognizant of these philosophical views may be surmized from the activities, knowledge, and powers of some of their characters. Lewis' character Uncle Andrew in *The Magician's Nephew*; Tolkien's Sauron in the *Lord of the Rings*; and Williams' Mr. Berringer and Mr. Tighe in *The Place of the Lion* and Henry Lee and his uncle in *The Greater Trumps* all represent a misuse of the Platonist and Jewish Platonist opportunity and ability to seek knowledge of suprasensory aspects of creation. That is, each wishes this knowledge for the sake of the knowledge per se; for the sake of the power that such knowledge gives; or for the sake of the contemplation of the beauty that inheres in the suprasensory.

The Jewish Platonist view, on the other hand, is that the knowledge of the suprasensory will harm the individual who does not seek it out of a willingness—an eagerness, rather—to use that knowledge for the well-being of the community. And Lewis, Tolkien, and Williams likewise draw attention to the serious results of the misuse of these Platonist modes of inquiry. Nonetheless, there is ample evidence that each was sympathetic with the legitimate use of these methods. For each has at least one character who proceeds successfully along the path to the achievement and use of knowledge of the suprasensory. There is Tolkien's Gandolf who is a hero in *The Lord of the Rings*; Lewis' Hermit of the Southern March who is a kindly and honest character in *The Horse and His Boy*; and Williams' Prince Ali in *Many Dimensions* who is well-intentioned according to his own lights.

It is clear, however, that Lewis, Tolkien, and Williams are interested in contrasting all forms of non-Christian Platonism with Christian Platonism. Further, all three express the same conclusions on this topic through their characters' moral and spiritual development, as shown in words, actions, problems, aspirations, failures, and successes. This conclusion suggests the importance for these three writers of the distinction between, on the one hand, the Platonist and Neoplatonist knowledge of reality that is not Christian and, on the other hand, the way in which that knowledge is achieved. In general, Lewis, Tolkien, and Williams are agreed that these metaphysical beliefs are true. Also, they are agreed that these beliefs are desiderata for the spiritual development of some persons and their subsequent fulfilling of their roles in their communities.

The view of these three writers, however, is that these non-Christian approaches to metaphysical knowledge are not necessary for the Christian. And for the latter they may, in fact, be counterindicated. For the events of the Christian's life, together with his faith in Christian beliefs maintained through these events, takes the place of the several non-Christian disciplines. Through numerous sources come the needed insight into, convictions concerning, and experience with normally hidden depths of reality. A belief in the providential nature of these events, always important in Christianity, is a major theme in the work of these three writers.

Lewis encourages this interpretation of his work. For, on the one hand, he tells of his rejection of the non-Christian modes of inquiry;<sup>19</sup> yet, on the other hand, his fiction and much of his philosophical work are informed by the Platonist metaphysics. Peter, high king of Narnia, discovers that whatever knowledge of reality he requires comes to him from a variety of sources. At these times he is grateful that he has no need to use "magic." And Lewis uses "magic" to name non-Christian knowledge and the use of the laws of creation, particularly those pertaining to suprasensory aspects of creation. Also, Elwin Ransom is admitted to important knowledge of reality and of some creatures that he could never have achieved in his English university education because he had a love and reverence of the new truth he had glimpsed and because he loved those creatures whose language, knowledge, and perspective on reality he wished to learn. Lewis' description of Ransom's experience has great import for the understanding of Christian Platonism: "Through his knowledge of the creatures and his love for them he began ever so little" to hear their music "with their ears."<sup>20</sup>

Analogous comments are to be made of the characters of Williams and Tolkien who are spiritual leaders. Each in a distinctive way, and always in a way that is both practical and at least implicitly Christian, is an intellectual leader and provides metaphysical insight as well as spiritual leavening when and how they are needed. Thus, the unmistakable heroes of *The Lord of The Rings* are Frodo and Sam whose faithfulness and good will toward their respective tasks won for each knowledge needed for his work and the strength and wisdom to appropriate that knowledge. Also, there are Williams' characters Sybil in *The Greater Trumps*, Chloe in *Many Dimensions*, and Anthony in *The Place of the Lion*. Of great import for the comprehension of Christian Platonism are Anthony's reflec-

tions on the eve of his achieving the knowledge of reality and the determination, courage, and clarity of purpose that he needs to lead his community out of chaos:

An intense apprehension of the danger which many . . . were in grew within him, a danger brought about by the disorder which had been introduced. He could not honestly say he loved these others, unless indeed love were partly a process of willing good to them. That he was determined to do, and perhaps this willing of good meant restoration. By order man ascended; what was it St. Francis had written? "Set love in order, thou that lovest Me."<sup>21</sup>

A constant theme in all the literary creativity of Lewis, Tolkien, and Williams is the fundamental roles in creation of truth, goodness, and beauty and their inextricable interdependence. This theme, which they elaborate and defend in numerous ways, may be seen as a Christian appropriation of Diotima's affirmative answer to her question, "Is not the good also the beautiful?"; of her emphasis on the "science of beauty everywhere"; and of her teaching that, since beauty is the accompaniment of truth, true beauty will be recognized by persons with a rectified spiritual nature.<sup>22</sup>

Lewis' character Lucy, whose name signifies her spontaneous, eager discerning of the light of truth, has a deep appreciation of natural beauty. Her cousin Eustace, however, who is totally self-centered and out of touch with the true spiritual and moral orientation of creation, finds no beauty in stars, trees, or the great Aslan, who is spiritual leader of Narnia and friend and teacher of the children whom he calls to work in Narnia.<sup>23</sup> Tolkien's characters who are willing, albeit grudgingly, to lend a helpful hand to others and to try to keep their promises, display in their words and actions a pleasing whimsy. And some of these characters ultimately in their very being achieve a great beauty. On the other hand, orcs, whose exploited nature suggests the Platonic understanding of evil as the nonbeing of good, have faces, music, and language that, because of their ugliness, are frightening to innocent well-intentioned creatures. Williams' acceptance of the metaphysical ground of the interdependence of truth, goodness, and beauty is implicit in *Taliessen Through Logres*.<sup>24</sup> And the beauty of the transcendent archetypes as well as the beauty they bestow on all that participates in them is explicit in Mr. Tighe's ecstatic discernment of the archetypal butterfly. Mr. Tighe suffers a severe lack of spiritual development, however, as seen in his failure to care sufficiently for his daughter (i.e., because of his failure to appropriate the truth and the goodness that are the correlatives of the beauty he loves).<sup>25</sup>

Other important aspects of the Platonist tradition, which are stressed by one or two of our writers but not predominantly featured by all three, are the Platonist psychophysical dualism; the other-worldliness that is implicit in the latter; and the Platonist ontological view of the degrees of being.

According to the Platonist psychophysical dualism, although in this life soul and body are one harmonious whole, the individual is not his body nor the combination of spirit and body. Rather, the individual is spirit, and, surviving the death of the physical body, is at home eternally in suprasensory aspects of reality. That this is Lewis' view is clear. In *Out of the Silent Planet* the Oyarsa, or

archangel, can unbody anyone he likes; and the rational creatures who have been killed by evil men are said to have been unbodied and to have gone to their eternal home.<sup>26</sup> Further, at least three of Williams' novels—*Many Dimensions*, *Shadows of Ecstasy*, and *Descent into Hell*—are supportive of this psychophysical dualism.

The Platonist other-worldliness is a corollary of the Platonist psychophysical dualism. It is the belief that the mundane world is not man's true home and that during life in this world the hope for the next life provides a steadying, leavening influence. Perhaps this other-worldliness may safely be said to be at least implicit in the work of Tolkien and Williams. Tolkien's Frodo looks forward finally to unending life in the Grey Havens. It is suggested by friends of Williams' character Chloe that the latter will find fulfillment in the next life after her sacrificial acts in this life. The Platonist other-worldliness is, however, unmistakably a major theme in the writing of Lewis. He calls the intellectually and spiritually consummatory last chapter of the last volume of the *Chronicles of Narnia* "Farewell to Shadow Lands." And, as we have seen in the quotation given above, his characters who leave the shadow lands, having passed suddenly through physical death, find themselves in the "real England." And Lewis ends *The Chronicles of Narnia* thus:

And for us this is the end of all the stories, and we can most truly say that they all lived happily ever after. But for them it was only the beginning of the real story. All their life in this world and all their adventures in Narnia had only been cover and title page: now at last they were beginning Chapter One of the Great Story, which no one on earth has read; which goes on forever; in which every chapter is better than the one before.<sup>27</sup>

Finally, with Heidegger's having recalled the philosophical community to work in ontology, it is of no little import that Lewis may be interpreted as having also called our attention to ontology and having thus made a creative contribution to twentieth-century ontological thought. The basis for this statement is the last four chapters of *The Voyage of the Dawn Treader*. This novel tells how some of the characters are permitted to get very close to, yet not to enter, Aslan's country, which is the eternal home of those who die in Narnia. As they approach it they find differences in their very being and in the being of their surroundings. The characters need less food and sleep. Their eyes grow sharper and their minds clearer. The air becomes brighter, and the water is sweet. There is no explicit ontological discourse. But the children's responses, particularly those of Lucy, indicate ontological changes. Lewis describes some of their experiences thus:

There seemed no end to the lilies. Day after day from all those miles and leagues of lilies there arose a smell which they found it very hard to describe: sweet—yes, but not at all sleepy or overpowering, a fresh, wild, lonely smell that seemed to get into your brain and make you feel that you could go up mountains at a run or wrestle with an elephant. She and Caspian said to one another, "I feel that I can't stand much more of this, yet I do not want it to stop."<sup>28</sup>

I suggest that here Lewis has appropriated the Platonist ontological view of degrees of being and, moreover, has revealed its existential import for those, but

only for those, who are privileged to know mystically the aspects of reality where a fullness of created being is encountered.

3. To conclude: clearly the reappearance of Christian Platonism in our day is of interest to the historian of philosophy. It also has great significance for the creative and the constructively critical thinker. For Platonism has ever proved capable of harmonious synthesis of diverse philosophical views. A corollary is that Platonism has been developmental, Platonists having persuasively demonstrated the timeliness of their views in many times and places. Lewis, Tolkien, and Williams have given us clues to the present timeliness of Platonism by showing the existential import of this position.

Further, in the developmental aspect of their thought each has introduced a feature that in respect to Platonism is, perhaps, new as well as timely. This is the fact that not one of them has offered Christian Platonism as the sole path to true spiritual fulfillment. Each has characters who are appreciative of some types of beauty, truth, courage, and compassion, but who are in some respects not in total sympathy with the characters who represent the appropriation of Christian Platonism. Further, each of these characters brings to his community data, insights, and perspectives on reality and man that are possible to him only because he has walked his particular spiritual path. In fact, the view that there are several spiritual paths, each making possible the spiritual fulfillment of some, but only of some, is a central theme of all three writers. One thinks of Tolkien's hobbits, elves, dwarves, Valar, and men, each of whom in distinctive ways possesses some objective truth, enjoys some beauty and artistic creativity, and serves good causes. One thinks also of the several kinds of creatures Elwin Ransom learns from and comes to love in *Out of the Silent Planet*. And definitely this theme is dominant in Lewis' portrayal of life at Saint Anne's Manor, although it is suggested that the Christian Platonists of the community are intellectual and spiritual leaders.<sup>29</sup> And Williams' novels feature the tremendous importance to the philosophical enterprise not only of Christian but also of pagan, Jewish, and Islamic Platonism. I have suggested that this movement toward a philosophical ecumenism is a development within the synthetic creativity of Plato.

Further, there is in all three writers at least the suggestion of a ladder of intellectual, aesthetic, and moral development of the individual. In its totality this ladder is Platonist, Christian, and useful in our day. The first step on the ladder, however, is common to all paths that lead to peace and spiritual development. Not to take this first step is to choose one of the many paths that inevitably lead to frustration, and may lead to despair. This first step which may, but need not, lead to the spirituality of Christian Platonism has four features.

First, there is the willingness to the extent that one is able to give love to one's fellow man. *Love*, of course, is equivocal. And Lewis' analysis of love into four types serves admirably to illustrate the meaning of *love* in this context.<sup>30</sup> These are the appreciation of, rather than indifference to, others; willingness to share one's interests with likeminded persons; the recognition that one has need of others and the grateful appreciation of the persons who supply the need; and the charity which forgives and gives of itself for the sake of others. In this connection

we have seen the importance of love in the thought of all three writers. Second, there is hope which eschews skepticisms about the feasibility and value of the search for the truth that satisfies the spirit. It is the maintaining even in times of boredom, frustration, and pain of a trust in the burgeoning of a new spring in one's life and in the affairs of one's community. This hope is seen in the Narnian's sustained hope for the end of winter and in Gandolf's and Frodo's courage maintained through intense personal misfortune.<sup>31</sup> And among Williams' characters there is hope in the spiritual awakening of Damaris and her effort to rebuild her life and the lives of those close to her.<sup>32</sup>

Third, wonder is needed. This is the wonder that Aristotle said is the source of the search for truth. And perhaps in respect to Aristotle's emphasis on wonder, we do well to reflect that Aristotle is the pupil of Plato. For in the *Dialogues* Plato continually expresses wonder before beauty and the truth which is the correlative of beauty. Wonder before objective truth, before the beauty of that truth, and before the stupendous power of rational creatures to respond to the demands of life are constant themes in the lives of the characters of these three writers. Fourth, each writer sees the individual as possessing freedom to take some responsibility for cultivating love, hope, and wonder. Although on the other hand, each writer is also realistic about the extent to which and the ways in which the individual's power of choosing these may be limited, confused, or misguided.<sup>33</sup>

Although, as I have suggested, the nonexclusivist view that the taking of this first step may lead to a variety of spiritually fulfilling relations to reality may be new, the theme of the philosophical import of the spiritual development that corresponds to the axiological as well as the epistemological structure of reality is not new. This view has been present in all forms of Platonism. Here is, however, a most significant type of philosophical creativity: the present-day recalling and development of philosophical truth that has been virtually forgotten but which nonetheless is full of promise. In particular, Lewis, Tolkien, and Williams have drawn our attention to the role in philosophical inquiry of the spiritual development of the thinker. The many valuable areas of the philosophical enterprise which are stressed in our day are alike in ignoring this view of the demands that philosophical work makes on the thinker. At the very least these three writers are recalling us to the unification of all aspects of our nature in the philosophical enterprise. They have pointed to a path of philosophical creativity which is really a renewal of an ancient path. And the beauty that their characters are able to find on that path and the doors of learning and service that their faithfulness opens to them are powerful final causes attracting some of us to the same path and its current philosophical promise.

# 18

## *Negative Theology, Myth, and Incarnation*

A. HILARY ARMSTRONG

There are few, if any people who have done more than Jean Trouillard to open our eyes to the depth and richness of the thought of the last Hellenic Platonists, above all of Plotinus and Proclus. My own debt to him is immense, and I know others, of very different ways of thinking, who would say the same. But he has not been content simply to expound these venerable thinkers as period pieces, belonging to a past time and irrelevant to the concerns of our age. He has tried to show that they can speak to our condition, and do something to illuminate the religious and philosophical perplexities of our own time (though not, as we shall see, by providing dogmatic solutions). This has sometimes brought upon him the charge of inventing a "neo-Neoplatonism" of his own (a very Platonic thing to do). But his concern for the contemporary may be a very important reason for the depth of his insight into the ancient. And it is because of this that I dedicate in his honor this odd attempt to show the relevance of some of the late Platonic ways of thinking which he has so well explained to us to the crisis of religious thought in our own time.

It will be well to begin by explaining what this large vague phrase "the crisis

of religious thought" means to me. What seems to me to have been happening for a very long time, but to have become particularly apparent recently, is the progressive breakdown of any and every sort of "absolutism." By "absolutism" I mean the making of absolute claims for forms of words and ways of thinking about God as timelessly and universally true (including, of course, the absolute claim that all God-talk is meaningless and hopelessly incoherent). These claims can be made in various ways. They can be made by prelates, preachers, and theologians asserting the absolute, unique, and universal claims of one special revelation; or by philosophers of the older style (including, of course, systematic Platonists) who claim that their metaphysical system is the one absolutely and universally true philosophy and, of course, those of their newer-style opponents who claim equally dogmatically that *their* philosophy provides the one infallible method of disposing of all this metaphysical and religious nonsense; or by the believers in a *philosophia perennis* in the Huxleyan sense, a single tradition that underlies all the great religious traditions and is uniformly confirmed by all religious experience. There are, of course, plenty of absolutists of all these varieties still with us. But their influence is generally confined to restricted circles, and outside these circles (and I think increasingly within them) absolute claims and assertions are now subjected to immediate critical questioning, and generally found wanting or dubious: historical claims are questioned historically, and dogmatic nonhistorical statements (e.g., about the personality of God or the Trinity) are questioned philosophically.

Two points must be made here, which will probably indicate to many what a conservative and old-fashioned paper this is. The first is that questioning does not mean outright rejection; that would be just another, and unpleasant, form of dogmatism. In the field of Christian theology the rejection of "absolutism" does not mean that "radical" positions are always to be preferred to "conservative" ones. Many radical positions are very silly; many conservative ones deserve serious consideration and are supported by excellent scholarship. Nor does critical questioning mean wholesale rejection of the great systematic philosophies. This paper is permeated by the deepest qualified affection and critical respect for the great late Platonists, Hellenic and Christian, who were in some ways very systematic thinkers. And even if one finds the idea of a *philosophia perennis*, in any sense, implausible, one can still agree with its exponents who insist that living tradition is necessary for any art, including the art of living. What the rejection of absolutism means is that all dogmas become hypotheses, and that one does not arrive at an unhypothetical principle of demonstration or guarantee of certainty. (God is not such a principle or guarantee.) One therefore simply continues the discussion, probably forever. One must stand away from the tradition one respects (as Aristotle stood away from Plato and Aristotle's personal pupils from Aristotle), not to propound an improved dogmatism of one's own, but to go on asking more and more questions. This paper is conceived in this spirit, as a contribution to a completely open-ended discussion, not as a final solution to anything. The second point is that when claims to possess an exclusive revelation of God or to speak his word are made by human beings (and it is always human beings who

make them), they must be examined particularly fiercely and hypercritically for the honor of God, to avoid the blasphemy and sacrilege of deifying a human opinion. Or, to put it less ferociously, the Hellenic (and, as it seems to me, still proper) answer to "Thus saith the Lord" is "*Does he?*," asked in a distinctly sceptical tone, followed by a courteous but drastic "testing to destruction" of the claims and credentials of the person or persons making this enormous statement.

What are the reasons for this breakdown of absolutism? The first, and oldest, is, probably, steadily growing intellectual dissatisfaction with the arguments produced for the various and incompatible absolute positions. This springs from a very venerable element in our tradition, the sceptical in its Academic form,<sup>1</sup> which has revived particularly strongly in Western Europe since the Renaissance, and been powerfully reinforced in the last two centuries by the development of critical philosophy and critical history (modern critical historians and scholars are perhaps the truest spiritual descendants of the Academics in our world). The second, which is also ancient (it can be traced back to Herodotus), but which has developed very powerfully in my own lifetime, is an intense and vivid sense of our own historical limitations. We are aware, both by experience and our study of history, of the immense and irreducible diversity of human beliefs and ways of thinking. We know sufficiently well that not only our own thought but that of the founder and teachers of any religious group or philosophical tradition to which we may adhere is limited and determined by historical circumstance, by time, place, heredity, environment, culture, and education: even quite small differences in the circumstances of our education (e.g., going to a different university, or even a different college in the same university) might have made our religious and philosophical beliefs quite different by causing us to be influenced by different people, to read different books, and so on. And we think this matters—it is not to be casually dismissed with a few rude remarks about "relativism," as is still sometimes done. We should think it crudely and antiquatedly arrogant to be certain of our certitudes, especially in religious questions, without unattainable confirmation by the agreement of all those, of all beliefs and ways of thinking—saints, sages, and scholars—who are or have been competent to consider the belief for which certainty is claimed. This leads straight to the third reason for the breakdown of absolutism. This is comparatively modern (though it is anticipated to some extent in pre-Christian antiquity) and its strong and full development and increasingly wide dissemination are becoming more and more notable in our own time. It is the vast and unprecedented increase in our knowledge of other ways of faith, piety, and thought about God than our own, which has more and more both led to and been helped by a growth of understanding, respect, and sympathy for them and a willingness to learn from them. Especially if this is not merely gained by reading, but also by direct acquaintance with other ways and personal friendship with those who follow them, this produces an irrevocable change of mind and heart, which both strengthens and is strengthened by our sense of historical limitations. Our new awareness includes, of course, an awareness of the divergences, tensions, and contradictions within our own tradition and the value of many ways in it which diverge from those authoritatively accepted. We have become con-

scious of the folly and arrogance of "not counting" people; of simply dismissing from consideration (as some philosophers and theologians still do) those who do not conform to the official orthodoxy of the group to which we belong. We have learned at last, I think once and for all, to believe that there is no one universally true or universally saving way—that many different paths lead to the great mystery.

At this point some religious persons will no doubt want to say "But what about *real* faith? What about the Leap, the Wager, the Great Option? Throw away these rationalistic hesitations and commit yourself, if you want to know what true faith is." I am unable genuinely to accept this peremptory and dramatic invitation (I have tried hard enough), because, if one really looks around and stops "not counting" people, one finds that one is being invited to leap in altogether too many directions at once. One can only discriminate between them by returning to the probably endless and inconclusive critical discussion of claims, credentials, and arguments. And even if there was only one direction to leap in (and some Christians still talk as if this is so), it would be impossible without returning to the critical examination of the claims and credentials of the clergyman summoning me to faith (and other related matters), to distinguish faith from gross credulity, which is not religiously or morally virtuous, especially in an academician. I cannot, with regret, accept the view that our experience or awareness of God can in itself justify or guarantee one particular dogmatic and exclusive faith. This is because I hold the view that this experience (even at its lower levels) is strictly ineffable; we naturally try to interpret it, always inadequately, in the language of the religious tradition to which we belong, but the experience does not justify or guarantee the interpretations (not that we can think or say what it is "in itself" or compare it with the interpretations). Yet this whole paper is based on a faith in and dim awareness of the Unknowable Good, which I cannot and do not want to get rid of, but which remains tentative, personal, not absolute or exclusive, and making no demands on others.

What, then, has the old Neoplatonic "negative theology," and other related aspects of the later Platonic tradition—Hellenic and Christian—to give to those who have experienced the breakdown of absolutism but still want to believe in and worship God? I can only offer what I myself have found helpful. Trouillard has written most illuminatingly on this subject, and I have stumblingly tried to follow in his footsteps<sup>2</sup> (and have also learned very much from the Greek Orthodox Abbess Maria, who really lived the "negative theology" to its ultimate point). I will not here repeat much of what can be found better elsewhere, but it must be stressed that what seems likely to be helpful is the fully developed negative theology in which we negate our negations (which does not mean that we simply restore the original positive statement with a "super" attached, although this language is often used by the ancients because they could not find anything better); perhaps the "pre" language often used by post-Plotinian Neoplatonists ("pre-being," "preintellect," etc.) is somewhat less misleading nowadays than "super-being" or "superintellect". This leads us to the state of mind in which we are not content simply to say that God is not anything, but must say and be aware that he

is not not anything either: and, in the end, not even to know that we do not know. It is a strange kind of liberation from thinkings and languages that enables us to use them freely and critically, always with a certain distance and detachment. (There are, of course, a number of kinds of human language—poetic, musical, those used in the visual arts, and mathematical, as well as the rather clumsy and limited prosaic-discursive kind normally used in philosophy and dogmatic theology, which by no means escapes metaphor.<sup>3</sup> Of course, if we use this last we must use it precisely, and according to the rules of the game as played in our particular environment, as the great Neoplatonists did excellently.) Having gotten this far, we can, of course, use positive terms about God as freely as negative, provided that we prefix something like the favorite *hoion* of Plotinus ("as if" or "in a manner of speaking") to indicate their inadequacy. I can agree a great deal with what Christopher Stead says about the desirability of using "being" or "substance" terms about God, on the appropriate occasions, and could supply him with some excellent Neoplatonic texts in which they are freely and quite consistently used in a context of radical negative theology.<sup>4</sup> It seems that the traditional terms "beyond being," "nonbeing," or "nothing" applied to God are most significant when used in their proper Hellenic context in which being is closely correlated with intelligibility: real being is intelligible being. They mean, then, that God is not a somebody or something who can be discursively defined or discerned with intuitive precision. It is not that his intelligibility transcends our limited and fallen human intelligences, but that he has no intelligible content: Trouillard has explained this very well.<sup>5</sup> It is this ability to use positive terms in a peculiar way that may make the negative theologian sympathetic to "myths," as we shall see. I prefer, myself, to call what I am talking about "icons," partly for reasons of my own not unconnected with Eastern Orthodox theology and piety, and partly because "myth," since about the fifth century B.C. has had, probably for most people in the Western tradition, the rather narrow and derogatory meaning of "more or less poetic fiction." I shall, however, use "myth" (in an extended and complimentary sense) in this paper in order to relate it to contemporary theological discussions.

Before proceeding to discuss myth, it should be made clear that what has been said about "negative theology" so far is perfectly compatible with conservative Christian orthodoxy. The Eastern Christian tradition as a whole and many perfectly orthodox and traditional Western theologians insist that all our language about God is inadequate, that our statements about him are only "pointers" to or "icons" of his unknowable reality. But they hold that certain statements only are divinely revealed or authoritative, and so are privileged pointers or uniquely authorized icons, and that the Incarnate Christ is the one and only perfect icon (to use patristic language) of the supreme divinity. Reasons for disagreeing with this have nothing to do with the "negative theology" as such. They spring from the attitudes of mind discussed earlier which have led to the general breakdown of absolutism. For those in whom this breakdown has taken place, however, the "negative theology" can, I think, do something useful. It can, sometimes, prevent them from giving up the whole business of religion in disgust—the usual reaction—and help them to remain at least dimly aware that there is really somebody or

something there "behind" or "beyond" (to use the inadequate spatial metaphors that we must all use in this context) the dubious stories and inadequate concepts and definitions. It may help to give some expression to a deep, obscure anonymous faith that remains untouched by the breakdown of absolutism, though as the result of this breakdown it insists on remaining anonymous. And those who arrive (not necessarily by a Neoplatonic route) at understanding that a radically apophatic faith permits the use of very positive language in a peculiar way may come to understand the expressions of their traditional religion "mythically" or "iconically" and not just as "myths" or "icons" made up by men, but as a multiple and varied revelation of images through which the Good communicates "iconically" with all of us, of all religious traditions, according to our several needs, that we may all have something through which to sense his presence and worship him.

If we understand "myth" in this way, as part of the expression of what happens when the Unknowable, so to speak, seems not content to remain aloof in his ineffable obscurity but "turns" and comes back to us as the painter of many icons not made with hands in that "outgoing" which "Dionysius" calls his "ecstatic eros," we may see better how we should use the term and how widely it can be extended. The sense to be given to "myth" in the context of this way of thinking will obviously be strongly positive. It will often be practically equivalent to something like "general" or natural revelation (this involves, of course, human participation, and human error and inadequacies, in expressing what God suggests). In this way it will come close to the significance of myth (and ritual) as understood by Proclus, whose accounts of the function of mythical and mathematical imagination are most illuminatingly correlated and discussed by Trouillard.<sup>8</sup> Myths and the rites and arts that express them can provide true ways to God, although they can also mislead. (The superbly and fruitfully ambiguous valuation of art in relation to philosophy and religion by Iris Murdoch in her very Platonic—though not Neoplatonic—book on Plato and the artists<sup>9</sup> should be carefully studied by anyone who wishes to understand its dangers, uses, and, in the end, inescapable indispensability.) But myth for Proclus is exclusively poetic or imaginative myth: and he would not have been at all pleased if we extended the term to cover his own (or, as he thought, Plato's) systematic philosophical theology. But the breakdown of absolutism seems to have made it necessary to see systematic theology mythically, as well as the alleged historical facts contained in some particular revelations. The most abstract and logically constructed treatments of the Henads or the Trinity can only function for us mythically, if they function at all. (One can, and should, of course criticize the logic, as one can criticize the historical evidence or the expressive quality of the images in other kinds of myth, but these separate and distinct kinds of criticism will not necessarily deprive the myths to which they are applied of all power and value.)

It may help to clarify the way in which I regard the Christian story and Christian doctrine as mythical if I compare my position briefly with those of a small selection of others. I am not conscious of any strong differences with Maurice Wiles, though our different environments and preoccupations may lead to rather different theological conclusions. I admire the scholarly caution and reli-

gious discretion with which he pursues the argument, and find his comparison between the way in which Christian thought about the Creation and the Fall has developed and the way in which Christian thought about the Incarnation might reasonably develop fruitful; and his statement (derived, like so much else in contemporary discussions, from Strauss) that a myth may have a historical element may be a very useful corrective to extremist positions.<sup>10</sup>

With Don Cupitt, and others who think like him, my difference is rather sharp, and may be of some general significance.<sup>11</sup> It is not that I object to his history—his treatment of the evidence seems to me at any rate plausible. But (to say something which, from inherited reverence, I have refrained for some time from saying), I do not find the Jesus of good critical biblical scholars very impressive or interesting. I am not even sure that the only people in the first century A.D. with whom I can conceive myself having much in common would have thought so, that is to say, Greek-speaking people with some degree of Hellenic philosophical culture, for instance in the neighboring Decapolis. This reconstructed Galilean rabbi, this Jesus (or these Jesuses) of scholarship, seems very restricted, not only in period but in place and culture.<sup>12</sup> It seems unlikely that the "Jesus of scholarship" can ever attain even the limited universality, even in our transitory Western culture, of the "Christ of history." (I am using here the excellent terminology of Wilfred Cantwell Smith. The "Jesus of scholarship" is the Jesus reconstructed by scholars; the "Christ of history" is the mythical or iconic Christ, the Christ who has mattered in Christian history.)

I owe a personal debt of gratitude to the biblical scholars and theologians, conservative and radical, to the demythologizers and de-Hellenizers from Bultmann onwards, and to those who, with excellent pastoral intentions, have forced the Bible so much on our attention in the non-Reformed churches in recent years. They have shown me something that I was too obtuse and traditionalist to notice before, but is of the greatest historical significance—our Inherited Conglomerate (as Gilbert Murray and E. R. Dodds would call it)<sup>13</sup> is breaking up. The biblical and the Hellenic elements are, apparently now finally and irrevocably, coming apart. And, if they come apart, it is not as certain as Christian theologians and preachers seem to suppose that most of those who remain at all interested in the matter will choose the biblical and reject the Hellenic. In my own case my remote forefathers (if they were ever genuinely converted to anything) were pretty certainly converted to a strongly mythical, Hellenized form of Christianity, and the succeeding generations, Roman Catholic or Anglican, retained this form, on the whole, and interpreted the Bible in its light. The faith of my fathers centered on the "Christ of history." The tradition handed down to me was the myth, and in my own religious wriggings of earlier years I think I was, at first unconsciously, trying to get further from the Bible and nearer to the myth, in a strongly Hellenic, Mediterranean form for which I still have much affection. (Of course my Christian parents and teachers in the earlier twentieth century took very good care to see that I should be well educated in Greek poetry and philosophy, which carry Hellenic religion.) I really do not think that I have much reason for allegiance to "authentic," "truly biblical" Christianity, whether radical or conservative. And now that

(because of the breakup of the Conglomerate) I have to choose between the biblical and the Hellenic, I shall choose the Hellenic, though I can only choose it as myth. And it may be that a good many other people, less well informed than I am about our own older tradition, will make the same choice: either because it has really been the strongly Hellenic elements in the theology and piety of the Conglomerate that will be discussed later which have attracted them; or because it is the myth that has inspired the great Christian visual art and music that may be doing more than anything else to keep something of Christianity alive in our own day; or because they are drawn to Indian or esoteric Islamic ways which are often (for whatever reason) very much closer to Neoplatonism than they are to Jewish-Biblical ways of faith, thought, and piety.<sup>14</sup>

To conclude this essay, let us attempt to see what a "mythical" treatment of the central Christian doctrine of Incarnation might look like. It must be stressed here again that there is no question of dogmatic rejection of traditional doctrines, but of well-grounded doubt, suspense of judgment, the reduction of the doctrines to endlessly discussible hypotheses. In this position one is perfectly entitled to consider as acceptable more conservative and traditional hypotheses than those just discussed, when they are well based on excellent scholarship, like those of C. F. D. Moule,<sup>15</sup> provided that they are still considered as hypotheses, and not used apologetically to justify a return to absolutism. And this means that, within the limits imposed by free and sound scholarship and history, a closer hypothetical linking of the "Jesus of scholarship" and the "Christ of history" might be attempted than has been suggested above. We are not bound to believe that the myth has no historical foundation or core, even if the extent of the historical element in it must probably remain forever undefinable. But it should also be made clear again that the rejection of absolutism and the questioning of claims and demands extends beyond the claim that Jesus was God Incarnate in a unique sense. It extends to all claims made that any revelation of God has unique and universal authority or that any people or community has been brought into a unique and special relationship with him. If anyone demands faith, submission, or territory as a representative of the unique "people of God," he should be taken all the way back to the covenant with Abraham and his claims tested every step of the way by the intensest criticism that can be brought to bear, for the honor of God. Criticism can be inspired by religious fervor as well as dogmatic faith.

Even if one is prepared to consider, tentatively, as tenable the hypotheses of the more conservative New Testament scholars who really are scholars and not apologists (some of course, rather bewilderingly to the layman, speak now in one capacity and then in the other), one will probably have to go fairly far in separating the fully Hellenized "Christ of history" from the "Jesus of scholarship." (It is, at least, reasonably certain that Jesus was a Jew, and this makes a difference.) I have already shown my preferences if this has to be done.<sup>16</sup> What then, can an irremediable gentile like myself make of the center of the Christian myth, the doctrine of Incarnation? A good deal, in fact, and some of it surprisingly traditional; and I should describe my "mythical" interpretation as "expansionist" rather than "reductionist." The method I apply here to the thought of the Greek Fathers

is, of course, heretical in the strict sense, a process of *hairesis* or selection. (There is a good deal of *hairesis* in orthodox theology, especially nowadays.) For this reason I bring them in, not to claim their authority, but to acknowledge my debt to them. The characteristic that I have discovered in their thought struck me most forcibly when reading Dionysius, particularly the *Divine Names*.<sup>17</sup> Though it can certainly be observed over a much wider area,<sup>18</sup> and I do not regard it in Dionysius as an Athenian Neoplatonist deformation of Christianity, it will make for brevity and clarity—and be appropriate in a paper in honor of Trouillard—if I discuss it in a Dionysian context. The first point which impressed me was that, though the language, and I am sure the belief, of the author of the Dionysian writings about the Trinity is perfectly orthodox, *Trias* is only one of the names (all inadequate) for the Unknowable God, the Thearchy, interchangeable with others: his Trinitarian theology is rather in the background and only comes into use when required for the purposes of his simplified, and in a sense Christianized, Neoplatonism. It is not grounded in, and has not much connection with, the historic Incarnation.<sup>19</sup> About this, again, the author's language and faith is quite orthodox. But, as with *Trias*, "Jesus" is, in the Christological passages of the *Divine Names*, just another name for the ineffable Thearchy, whose whole function in these passages he takes over, and the details of his earthly life are interpreted entirely symbolically.<sup>20</sup> What this seems to mean is that what really matters to Dionysius (and perhaps to many others, in the Greek-Christian tradition especially, though individual cases need particular and careful examination)<sup>21</sup> is the outgoing of the Unknowable Godhead in his theophanies and ecstatic *eros*, which is creation, and his leading all things back to himself by that same *eros*, in its return, which is redemption. And both of these are cosmic and universal, not strictly tied to a particular human person or historic event, though the historic Incarnation is of course seen as the exemplar, guarantee, and center of the whole creative-redemptive process and the principal means of redemption.

When one has realized that this sort of distinction between a universal and a particularist understanding of Christian doctrine related to the Incarnation can be discovered in our Christian tradition, and that the emphasis (especially, perhaps, in the Dionysian tradition) lies sometimes more on the universal than the particular, some consequences may begin to appear to one who is conscious of the "breakdown of absolutism" and the grave doubts that must now exist about the Incarnation in its historical particularity. If one retains some sort of faith in the Unknowable Good, one may still want to be able to see not only God's creative but his saving work, as extending from everlasting to everlasting, not only to every human being, but to every being in his universe (anthropocentrism is one of the disadvantages of conservative Christianity<sup>22</sup>); and to hold that God so works because the cosmos is in him and he is united with it (though "inexpressibly," as the Fathers say about the Incarnation) from the beginning with an intimacy that the hypostatic union of developed Christology cannot surpass. This is part of any Platonic faith because the Platonic Good is self-diffusive, and being good means doing good.<sup>23</sup> And I (because of my Christian background) can think of no better way of speaking of this ineffable outgoing of the Good in his *eros* than in terms of

the everlasting and universal mission of Logos and Holy Spirit. Others will legitimately prefer other ways of speaking. I know that I only use these words because my parents and teachers, the books I have read, and perhaps most effectively of all, the great liturgies and arts of Christendom have taught me to. If I had been brought up in India, or in a Buddhist or Islamic country, I should have used different myths or icons. And even within our own traditions, many of anonymous faith—but (often with good reasons) deeply anti-Christian—will prefer other ways of speaking. But, if the negative theology carried through the double negation leads, as it often does, to this sort of belief in cosmic incarnation, then the Christian “myth” can come to have a very powerful and positive effect as a myth. It will not give us the kind of assurance possessed by all the Fathers and traditional theologians who believe (as they do) in the unique Incarnation fully and completely as historical fact and the dogmas in which its meaning was explained as divinely guaranteed; we must be content with a more tentative and uncertain faith nowadays. And accepting a myth is not like accepting a creed. It leaves room for free reinterpretation, imaginative and intellectual development, and plenty of criticism of details and variation of emphasis (even the most orthodox and conformist Christianity allows, and has always allowed, for plenty of all these, though theologians have sometimes pretended otherwise). But, in the end, I can think of no better representations of the faith I hold, if they are interpreted in the free and universal way I have suggested, than the great theological and artistic “icons” of traditional Christianity.

## *Why Christians Should Be Platonists*

JOHN N. FINDLAY

In presenting this paper at the end of this distinguished conference I should like to make an apology. I am not contributing to the historic discussion of some Christian thinker influenced by Platonism or Neoplatonism in some remote epoch, but making a personal statement as to what Platonism signifies in my personal and philosophical life, and how it relates to my Christian and other interests. What I am going to say has many qualities of a sermon, a form of discourse to which I am becoming increasingly addicted, though without the talents or depth of a Meister Eckhart. I am going to ask you to see your Christianity and everything else you care for in the light of the inspiration to be derived from Plato and Plotinus. My giving this paper is also an impertinence in that I am not in any orthodox sense a Christian. I am by nature and by force of circumstances a syncretist and an ecumenist, one who has found devotional and spiritual guidance in the Tao-teh-King as much as in the New Testament, in Plotinus as much as Saint Paul, and in the Upanishads, the Gita, and the great Buddhist Sutras as much as in Christian devotional and theological works. I was unfortunate in my first contacts with Christian belief—in the form of Dutch Calvinism, that of the

church of my mother—which effectively turned me off. I now realize that it represents a great intellectual structure, deeply penetrated by scriptural influences and by a type of spirituality, the Pascalian or Kierkegaardian, which, though it can never be mine, still deserves respect and reverence. It is the narrow way along which certain fine natures have to tread, even if I have the ignorance or the arrogance to think that I can well follow another course. In any case I am sufficiently a Christian not to want to leave Christianity and its transfigured Founder out of my thought and life, and with this preamble I shall proceed to business.

I regard both Christianity and Platonism as making contributions to a discipline that I prefer to call "Absolute theory," though the Aristotelian terms "theology" and "first philosophy" would be equally appropriate. Christianity, of course, does a great deal more than contribute to a philosophical discipline, but so also does Platonism. By Absolute theory I mean the elaboration of a particular sort of concept to which I shall ascribe seven demarcating characters.<sup>1</sup> An absolute is, in the first place, something that is credited with being in an unqualified sense, that is, it must not be thought of as existing merely in the sense that someone thinks of it or makes it the object of concern, ultimate or otherwise, or that it is merely an aspect or character or structuring form, or a dependent part of something else from which it is inseparable. What sort of thing has being in an unqualified sense will, of course, differ from ontology to ontology, and need not necessarily be individual: an absolute must, however, enjoy the prime ontological dignity in the ontology in question. An absolute must in the second place exist of necessity: it must be absolutely impossible (and not in some merely formal-logical or merely natural-scientific or merely contextual or relative sense) for such an absolute not to exist. It must not only be a fixture, but an irremovable ontological fixture. This means that, in the case of anything that we put forth for absolute status, its existence must cover the whole *Spielraum* of possibility and therefore be unconditionally necessary, or, if it does not and cannot do this, it can occupy no area in the *Spielraum* of possibility, and will accordingly be wholly impossible. Necessity of existence or total impossibility represent the hard choice before an absolute: it is not one of the sort of things that could either be or not be. And the ontological argument is absolutely valid provided the absolute's existence is possible, but if its nonexistence is in any way possible, then it is totally impossible that it should exist. That an absolute's being follows from its possibility is no doubt exciting, but since this very circumstance may lead us to deny its possibility, it leads to no conclusive result. An Absolute must, in the third place, be unique and can permit of no rivals and no alternatives. If *per impossibile*, there were a number of alternate absolutes, none of them could be the Absolute and there could be no absolute at all. There may be a plurality of alternative absolutes for our clouded insight, but certainly not in the nature of things. An absolute must fourthly be in the highest degree unitary: it may have many inner differentiations into aspects, members, relations, or functions, but in all of these functions it must be totally present, and can suffer no diremption into separable parts. And, since it must be a complete reality in whatever category we put it, it must, fifthly, be

capable of having an inner distinction of the essential and inessential, and the inessential aspects of its nature must be ontologically dependent on its essential aspects, and be the realization of one or the other of the alternative forms of self-realization of which it is capable. And among such unessential aspects may well be a capacity to be the originaive source of many dependent and derived existences that do not share its unqualified necessity of being. There must, however, be nothing in them that does not derive from the absolute, and represent the actualization of one of its essential powers. And an absolute must be credited with the power to *determine* which of the alternatives open to it will be realized by it, and must require no deciding factor beyond itself. And the sixth property of an absolute is that it must be all-comprehensive, both in regard to actual existence and also possibility. There can be nothing that exists that is not either an aspect or inseparable part of itself, or something whose being wholly depends upon it in every respect. Such all-comprehensiveness is in fact identical with its absolute necessity: there must be no possibility that it does not cover and no actuality that it does not determine. To these six qualifications of unqualified and necessary being, of uniqueness and incompositeness, and of the power to determine whatever is not necessary solely in virtue of the necessary, essential part of its nature, we may add, as a seventh character, that since Mind and its guiding values are by far the most remarkable, unique things that exist, they must both have a place in the Absolute, whether at its very center or not far from it. To banish them from the Absolute, or to give them a very marginal, derivative place in it, would make their existence unintelligible, and destroy the very nature of the Absolute itself.

I shall not attempt a detailed justification of my sevenfold delineation of an absolute. Plainly the human mind is haunted by ultimate explanatory concepts of the sort I have been sketching, and this is even the case when nothing of the sort is explicitly talked of. Matter, space-time, logical space, and the sensory continuum can be absolutes as well as the Absolute Ego or the Idea of Good or the Absolute Idea. And plainly religion builds itself around and enriches concepts of the sort I have been outlining, and would be felt to be imperfect if it did not include *all* their conditions. I shall also not attempt to deny that there are very great difficulties in the concept of an absolute. On some views, for example, those of Kant in respect to the phenomenal world, a necessity of existence is itself necessarily inapplicable and impossible, and all that exists is necessarily a brute contingency. And on other widely held views, the existence of something which is *freely* capable of realizing one or other of a set of alternatives, and which requires no further determining factor beyond the fact that it *is* so capable, is also of necessity inapplicable and impossible. And many other qualifications for absolute status can be held to be logically absurd (e.g., that an absolute can have no alternatives). I do not myself think that the conception of an absolute involves any inherent flaw, if sufficiently worked out, but I certainly do not *know* this, since the sort of insight required for determining even the *possibility* of the existence of an absolute, which involves necessary existence and the exclusion of all thinkable alternatives, exceeds my powers and could only, if at all, be enjoyed by the Absolute itself. And there is the further difficulty that some might object to the very notion of a possibility which, since it

covered all alternatives, would amount to a necessity, in which case there could not be an absolute at all. Our modal concepts may be among the most important we dispose of, but they are also among the most obscure. Nonetheless, it remains profitable for us men to engage in our unreliable ventures into Absolute theory, which have not so far been shown up as invalid, and among the forms of Absolute theory that now come up before us for consideration are those of Christian belief, on the one hand, and of Platonism and Neoplatonism on the other.

How shall I attempt to characterize the Christian Absolute insofar as this is documented in the Scriptures and other representative expressions of historic Christianity? I shall do no more presently but apply my own sevenfold list of qualifications to my own general impression of Christian absolutism: everything I say will be open to countless objections which I shall not here attempt to field. The Christian Absolute I should regard as in its main traits the same as the Hebraic and the Islamic Absolutes: all have had extensive historical commerce with Platonism and Neoplatonism, but all have retained a physiognomy that is in some ways definitely non-Hellenic. They all certainly believe in an absolute that exists in no derived, dependent manner and which could not in any circumstances not exist. They also all believe in its uniqueness and its unity, even though Christianity believes in a threefoldness of personal aspect which is not posited in Judaism and Islam. The Athanasian Creed certainly rules out any suspicion of tritheism; the Christian Absolute is not divided among its constituent personae but totally present in each. The Christian Absolute is certainly also thought of as all-comprehensive as regards existence and as regards possibility. There can be nothing that exists that is not either an aspect or inseparable part of itself, or whose existence and character does not depend wholly upon and is not wholly determined by itself. And certainly the Christian Absolute is thought of as being of the nature of Mind, or as being the transcendent original of which minds, as we know them, are the dim semblances, and also as incarnating the values of knowledge, power, love, bliss, and beauty in a superlative degree, or as being something better than them all, of which they are again only the dim semblances. What, however, is distinctive of the Hebraic-Christian-Islamic Absolute, and what sets it apart from other absolutes is, in the first place, that it is thought of (at least predominantly, and by the philosophically less sophisticated) on the likeness of what is individual, of what exemplifies characters and values and activities and relationships rather than on the likeness of those characters, values, activities, and relationships themselves. The Absolute of much of Christianity exists rather than is being, is mighty rather than is might, is beautiful rather than is very beauty itself, and so on. That "God is love" is indeed a Christian utterance, and that "to live and die are alike Christ" is also a Christian utterance, but there is for the Christian a certain strain of metaphor in them, and it is more natural to say that God is superlatively loving or that living and dying alike can be Christlike. And with this rooted individualism, literal or analogical, goes a tendency to stress the contingent aspects of the Absolute, as one does in the case of an individual, and with this tendency goes the tendency—since the Absolute is the sole determinant of all that specifies or derives from it—to exalt the arbitrariness of much that the Absolute is and of all that

it outwardly effects. It has generated a world but it need not have done so; it has generated such-and-such types of creaturely being conforming to such-and-such laws and having such-and-such freedoms, but it could have generated a quite different array of creaturely beings, and so on. One may of course give the Absolute an essence constituted by what one regards as the highest values (compassion, insight, etc.), but in the concrete implementation of these values there will tend to be much arbitrary selection and use of individual things and persons. The Jews are the divinely chosen people, not the Philistines; Abraham or Moses or David are their chosen leaders, Job and Saul are not; certain practices are prescribed for purification, atonement, and so on, while others are proscribed as idolatrous and vain. The Absolute does not care for Cain's pure offering of the fruits of the earth, but relishes the odors of frying lambs. Even in the New Testament there is a considerable element of the arbitrary. For while Jesus is made the embodiment of characters of boundless understanding of human need and weakness and boundless desire for human happiness and moral regeneration, which as values have nothing that is arbitrary about them, there is also something essentially arbitrary and Judaic about his role as chosen Messiah, chosen from all eternity to proclaim the gospel of the Kingdom, and to bring it about by the dreadful rite of the Passion, with its betrayal, its condemnation, and its final agonizing execution, all of which were ritually necessary for the purgation of human transgression and for the ultimate realization of God's perfect kingdom. What is further arbitrary about the whole transaction is that the Passion was *not* provoked by man's unwillingness to recognize the universal absolute values that Jesus incarnated, but by the claims to a special messianic status which were essentially part of a Jewish historicistic mythology, which has no claims to the acceptance of all men of profound insight and good will. And if one substitutes later theological language for this earlier messianism, the arbitrary element consists in the choice of a particular human nature for fusion and transfiguration by the divine, timeless Logos. Even among the beautiful parables in the New Testament there are some that sadden us with a note of arbitrariness: it was not well for those who lacked a suitable wedding garment or who arrived late for the bridegroom's feast. This large element of the arbitrary, in my view, tarnishes the Absolute's image: like Habbakuk, as Voltaire describes him, he becomes *capable de tout*. He can harden Pharaoh's heart, while he reshapes and softens the heart of Paul; he has his vessels of honor and vessels of dishonor; he may even, as some late medieval philosophers opined, cause certain devout persons to have advance intimations of beatitude only to overwhelm them with final reprobation. We can then readily pass to the late medieval view, which Descartes also accepted, that the necessities of thought and the moral law are all in the last resort arbitrary, that they could and would have been otherwise had the Absolute so willed it.

These tendencies to attribute increasing arbitrariness to the Absolute are not necessary, but they spring from the strong individualism of the sort of absolute thus conceived. And with this deep individualism goes the tendency to set an unpassable gulf between dependent individuals and their absolute source, a gulf resembling that between ordinary finite individuals, only wider and deeper. The

immense disparity in status and power between the Absolute and its dependents then readily relegates the latter to the rank of puppets: how they will function, what roles they will fulfil, all wholly depends upon the Absolute. They will have the further disadvantage of not feeling themselves to be puppets or wishing themselves to be such, and the conviction that they are such will be profoundly painful to them. All the agonies I have been outlining have been actually felt by Christians, mainly of post-Reformation and Calvinistic creeds, who have given their absolutes too much of that divine seasoning, contingency. Contingency is the glorious, many-colored outer icing of the ontological cake—if you will permit an irreverent simile—it is not a fit substance for its well-composed interior. It is not, as I say, necessary to conceive the Absolute as post-Reformation Christianity has so largely done, but there are strong forces always moving in this direction. This tendency has its main roots in the Hebrew scriptures, though there is, of course, much in these (particularly in the Prophets) that attenuates and ennobles it, and much too, of course, in the New Testament. It has, however, been Hellenic and (in the main) Platonic influences that have countered these tendencies in Christian absolutism.

I shall now say something about the brand of absolutism that is associated with Plato and Plotinus. This constructs an ontology in which primacy of being is given, not to particulars or individuals, but to the universal patterns that they exemplify, and in the prime case to patterns that are specific cases of intelligibility and excellence. The Platonic ontology has indeed a secondary place for patterns that merely approximate to, or fall short of, positive perfection, or which are merely relative or artificial or contingently complex, but its prime place is for the patterns of perfect substances and their essential excellences. (See, e.g., Syrianus on Aristotle's *Metaphysics*, 1078b, 32). Here we find the whole numbers of arithmetic, the celestial dynamics of a purified astronomy, and the patterns of souls that are able to cognize all patterns and direct all movements because all of these patterns are built into their structure. And beneath all these ideal structures lies the world of instances of which they are the true causes, though instantiation also involves the half-real media of empty space, on the one hand (in which indefinite multiplication and changeable combination become possible) and time, on the other hand (which is nothing but the half-real flux of sensible, instantial being, reduced to order by the regular motions that Soul and its higher exemplars impose).

Above all this complex hierarchical system, however, lies the Absolute, the Very Good itself, which is also Very Unity itself, the originative source of all the unified and excellent natures whether arithmetical, geometrical, dynamic, or psychic, and for their myriad sensible instantiations. For though Platonism sets an ineffable gulf of type between ideal patterns and their instances, and between the absolutely Good or One and all ideal patterns, this gulf of type does not prevent the lower from deriving from the higher, and throughout participating in its character, and in fact deriving all that it has by way of existence or essence from that which stands above it. Platonism, by not giving its Absolute the character of an individual instance, also enables it to communicate all that it has or is, in varying

degrees, to what falls beneath it, and without sacrifice of its ontological priority which cannot be shared by anything. And the Platonic Absolute necessarily and not arbitrarily develops its inner resources in the realm of ideal patterns and in the ideal intelligence that knows and delights in them all. And it necessarily overflows into the realm of instances in which accident, deviation, mutability, and other departures from perfection necessarily have their place. But over all these confusions presides an ordering Soul or Spirit, the highest of instantial beings, which gives tone and order to the instantial cosmos, while taking its own tone and order from what lies above. And the human soul can see nothing above it that is alien or arbitrary; what can raise and guide it always enters into its deepest being since the unity that is the same as being always holds it together and enables it to exist.

All these features of Platonic absolutism may be recommended to Christians. They give God the infinite distance from and otherness than his creatures, and from their creaturely deviations and abuses, which Christians desire, but, by making this a difference of ontological type, and not of individual being, they make God something that can be genuinely participated in and communed with, which is also what Christians desire. They make whatever is contingent and that might have been otherwise deeply different from what is essential and normative and essentially subordinate to the latter. Persons, rites, books, institutions, and so on, are only authoritative to the extent that absolute patterns are exemplified in them, and never in their own right. Instances as such never can be august. At the same time the contingent and the instantial are not to be scorned, for it is of the essence of the Absolute to flow over, or to be able to flow over, into finite instances and contingencies, in which there will always be possibilities of deviation that the Absolute can help to set right. And the Trinitarian structure that was hammered out in the early church is not unacceptable from a Platonic point of view. For if the Absolute is in the first place a pure unity which transcends being because it is Very Being itself, it is also an ideal intelligence that is the timeless thought of all the ideal patterns, and also a concrete living Soul which, itself an instance, presides over the whole instantial world. I need not say, further that there is place in Platonism for Incarnation theology: if the Soul is a supreme instance presiding over the instantial world, there may also be a human instance that surpasses all other instances in its participation in the Absolute. Only on Platonic assumptions there will not be an absolute gulf between this instance and various near-incarnations of other types and degrees. And even though no one comes to the Father but through the divine Logos, the divine Logos may have other sheep that are not of a given fold, and may shepherd many who have never heard of or acknowledged his Christian manifestations. I myself speak as a vagabond among folds, and a committed member of none.

Another reason why Christians are to be recommended to become Platonists is that so many of their best members have done so. This is, of course, also true of many of the best Jews and Mohammedans. Let us start with Clement of Alexandria whose hermeneutic principle was to interpret the Scriptures so that nothing discreditable was attributed to God, which meant that the Scriptures had to be made to satisfy Platonic standards. And let me then turn to Origen whose Father is

the Very Good itself, whose Son lives absorbed in his vision of the paternal depths but is surrounded by as many attendant essences, powers, and minds as in Plato and Plotinus, some of which fall into perverse ways but will for the most part return to the Father in a final restitution. Let me then mention Gregory of Nyssa who contrasts the participated goodness of finite things with the unparticipated goodness of God the Father, which includes all excellence in a wholly unsplintered, simple fashion, and contrasts with the Word which ramifies into countless distinct energies, and with the Soul which, in its higher functions, has much of the paradoxical unity-in-multiplicity of divinity. Let us also consider Augustine who, though in many of his utterances approving of the divine arbitrariness, also taught that God was Truth itself, Intelligence itself, and Unity itself, that he embodied whatever was categorial in *all* the categories, that he was good without having a quality, great without having a quantity, everlasting without having a date, and the source of all mutability without himself changing. Let us then also remember Anselm of Canterbury whose God, wrongly thought of by critical ontologists as *instance* of absolute perfection, is in his *Monologue* affirmed to be Perfection itself, Justice itself, and all other transcendental perfections, without exemplifying them as just and other good beings do. Such a being is indeed necessary as a supreme instance arguably cannot be. Finally let us consider Aquinas who, though boundlessly critical of Platonism in his explicit comments on it, is also infinitely Platonic in his actual teaching, no doubt deriving much of his Platonic inspiration from the Pseudo-Dionysius. Aquinas' God is *penitus simplex* like the One of Plato and Plotinus, and becomes many only in what derives from him and participates in him. He does not *exist* so much as *is* self-subsistent being: the gulf between him and his creatures is the ineffable gulf between what shares in being and what is the very Being in which other things only share. His existence is also one with his Essence: he is not characterized by various remarkable *properties*, but rather *is* the unified being of what in other things are only present as properties. And his perfection consists largely in this coincidence of essence and existence. God does not have to achieve the realization of anything he might have, since he already *is* whatever might be thus achieved or had, in imperfect form, by other dependent things. God's intelligence is further not at all like *our* intelligence which merely receives the pattern of external realities. God, like the supreme Unity of Neoplatonism, holds all finite existence in his power: in being himself, and thus inclusive of all possibilities, he is something that our cognitive intentionality only distantly imitates. His will also is a mere expression of his essence, the external actualization of an infinitesimal fragment of what in his timeless essence he is. The three Persons of the Trinity are somewhat dimly distinguished in the divine simplicity: they are outward-facing aspects rather than inner differences. Aquinas is so Platonic in his theology that he is almost a Unitarian. I shall not proceed further in my analysis: I approach Thomas as an interested outsider who perhaps sees things in him that his ultraorthodox supporters fail to discern. Certainly I see a much stronger vein of Neoplatonism in him than his orthodox expositors would countenance. He is acceptable to such as myself since the mere tantrums of will play a very small part in his Absolute: his God simply

is the systematic unity of all the values that I venerate, which I rejoice to see treated as more absolutely real than the botched things I see around me or that I know of through history.

I have, I may say in conclusion, given you a number of reasons why Platonic and Neoplatonic reinterpretations of Christianity are to be preferred to versions that are less revisionary, and that adhere more closely to the original Hebraic deposit. There is nothing impious in holding that, while the Jews may have provided the basic energies which make for the kingdom of heaven, it was the Greeks that gave them an intellectually acceptable and beautiful form. The Jews themselves, since the time of Philo, have admitted as much, and so have the adherents of Islam. Providence, the Absolute in action, works through many instruments, and is as capable of influencing Western spirituality through the subtle frauds of a Dionysius as through the narrow zeal of Tertullian. And I believe, as I have said, that the present syncretic confluence of many religious traditions also represents the Absolute in action: it deepens our understanding of what is invariant and necessary and what is contingent and variable in our belief and our devotion. Many of you will not agree with me at all, and you are quite at liberty to hold that Christians should resist the persuasive lures of Platonism.

# Notes

## INTRODUCTION

1. See A. H. Armstrong and R. A. Markus, *Christian Faith and Greek Philosophy* (New York, 1960), chapter 10.
2. Known as "Middle Platonism": see J. M. Dillon, *The Middle Platonists 80 B.C. to A.D. 220* (Ithaca, New York, 1977).
3. The Platonism of Plotinus and his followers is known as "Neoplatonism"; for a good survey see R. T. Wallis, *Neoplatonism* (New York, 1972). These historians' labels are potentially misleading. Plotinus could well be described as a very original and outstanding Middle Platonist, and non-Plotinian Middle Platonism (!) continued to affect the Platonic movement after Plotinus' death. All, in any case, would have described themselves simply as "Platonists."
4. See, for example, C. Fabro, *La nozione metafisica di partecipazione secondo S. Tommaso d'Aquino* (Turin, 1950).
5. The treatment in, for example, C. Elsec, *Neoplatonism in Relation to Christianity* (Cambridge, 1908), is no longer adequate. Albert Camus' dissertation for the Diplôme d'études supérieures, *Métaphysique chrétienne et Néoplatonisme in Essais*, ed. R. Quilliot and L. Faucon (Paris, 1965), contains some valuable insights, but is of most interest, it seems, for the study of Camus. A recent useful survey of Neoplatonism in relation to Patristic thought can be found in E. P. Meijering, *God Being History* (Amsterdam, 1975), pp. 1-18. See also H. Dörrie, "Die Andere Theologie," *Theologie und Philosophie* 56 (1981), pp. 1-46.

6. See H. Dehnard, *Das Problem der Abhängigkeit des Basilios von Plotin* (Berlin, 1964); D. Balas, *Meiosis theou* (Rome, 1966) (on Gregory); P. Hadot, *Porphyre et Victorinus* (Paris, 1968); P. Hadot, P. Courcelle, and A. Solignac (on Ambrose) in *Revue des Etudes Latines* 34 (1956), 202–239, and *Archives de Philosophie* 29, 3 (1956), 148–156; on Augustine's sources, see above, p. 35.
7. In a paper presented at the Conference on "Platonism and Christianity, the Fourth Century: Some Problems that Remain," Professor John Rist also gave a cautionary critique of various attempts to find Neoplatonic influences in Arius, Athanasius, and some Neo-Arians. This paper is part of a larger project to be published in the *Proceedings of the Toronto Saint Basil Symposium*.
8. On this triad see P. Hadot, in *Entretiens Hardt* 5 (1960), 107–141. On the *Liber de causis*, see Mahoney's bibliography below, p. 275, n. 45; p. 278, n. 56.
9. See McGinn's comments, above, p. 138.
10. The antidogmatic character of language about God in Neoplatonism and its religious value were also stressed by Professor Werner Beierwaltes in his paper "Image and Counterimage? Reflections on Neoplatonic Thought with Respect to Its Place Today" presented at the Conference and to be published in *Neoplatonism and Early Christian Thought*, ed. H. J. Blumenthal and R. A. Markus (Liverpool, 1981).

## THE PLATONIC AND CHRISTIAN ULYSSES

1. 'Ο Φιλόσοφος 'Οδυσσεύς, "the philosopher Ulysses," is an expression used by the twelfth century Byzantine exegete Eustathius, *Comm. ad Hom. Odysseam* I 51, vol. I (Leipzig, 1825), p. 17, 10; X 241, p. 379, 1, etc.
2. See the two antithetical declamations *Ajax* and *Ulysses*, ed. F. Deleva Caizzi, *Antisthenes fragmenta* (Testi e docum. per lo studio dell' Antichità 13) (Milano-Varese, 1966), pp. 24–28, with fragments 51, 52A, and 54, pp. 43–45 and the corresponding notes, pp. 105–108. See also R. Höistad, *Cynic Hero and Cynic King. Studies in the Cynic Conception of Man* (Diss. Uppsala, 1948), pp. 94–102.
3. Cf. *testim.* 2B and 12, and fragment 15 in J. F. Kindstrand, *Bion of Borysthenes. A Collection of the Fragments with Intro. and Comment.* (Acta Univ. Upsal., Studia Graeca 11) (Uppsala, 1976), pp. 106, 108, and 116, with the corresponding commentary, pp. 134, 155, and 204.
4. Thus *Diogenes epist.* VII 2 and XXXIV 2–3, ed. Hercher pp. 237 and 248; cf. W. Capelle, *De Cynicorum epistulis* (Diss. Göttingen, 1896), pp. 23–24; H. W. Attridge, "The Philosophical Critique of Religion under the Early Empire," in *Aufstieg und Niedergang der römischen Welt* II 16, 1 (Berlin-New York, 1978), pp. 64–65 dates the pseudocynographic Cynic letters to the first century A.D. One will note that later Ulysses ceased to be an *exemplum* for the Cynics, as can be seen in *Cratetis epist.* XIX, pp. 211–212; cf. W. Capelle, *op. cit.* pp. 52–53. The same change is found in "Un recueil de diatribes cyniques, Pap. Genev. inv. 271," edited by V. Martin, *Museum helveticum* 16 (1959), col. XIV 42–57, pp. 104–105, trans. pp. 82–83. On the Cynic Ulysses, see also W. B. Stanford, *The Ulysses Theme. A Study in the Adaptability of a Traditional Hero* (Oxford, 1954), pp. 96–100; F. Buffière, *Les mythes d'Homère et la pensée grecque* (Thèse Paris, 1956), pp. 367–374.
5. Cf. W. B. Stanford, *op. cit.*, pp. 121–127; F. Buffière, *op. cit.*, pp. 374–380.
6. Plutarch *Quaest. conviv.* IX 14, 6, 745DF. A probable reminiscence, as noted by F. Buffière, *op. cit.*, p. 480 (cf. pp. 476–481), of Plato *Phaedrus* 249B–250A, on the quasi-amorous emotion of the soul which remembers the former sights.
7. Thus Theo of Smyrna, *Expos.* ed. Hiller, p. 147, 3–6, credits the Pythagoreans with having meant by the Sirens the harmony of the spheres. Furthermore, two famous Pythagorean *akousmata* (in Iamblichus *De vita pythag.* 18, 82, = 58 C 4 Diels-Kranz, I, p. 464, 6–7) seem to testify, the one to a belief in a planetary sojourn of the souls after death (the Sun and Moon as the Islands of the Blessed), the other to the symbolic equation Sirens = cosmic harmony (the harmony in which the Sirens sing). See finally the attribution to Pythagoras of a theory of the Milky Way as the resting place of the souls that have left their bodies (Porphyry *De antro nymph.* 28, ed. Westerink et al., p. 28, 1–2; Proclus *In Plat. Rempubl. comment.* ed. Kroll II, p. 129, 24–26; Macrobius *Comment. in Somn. Scip.* I 12, 3; all three authors depend on Numenius: cf. *Testim.* 42, 44, 47 Leemans and pp. 151–152 of his collection), on which see P. Boyancé, *Études sur le Songe de Scipion* (Biblioth. des Univ. du Midi 20) (Bordeaux-Paris, 1936), pp. 136–137. There are, however, some reservations about this; see most recently I. P. Culianu, "'Démonisation du cosmos' et dualisme gnostique," *Revue de l'Hist. des religions* 196 (1979), pp. 4–10.
8. On this exegesis see A. Delatte, *Études sur la littérature pythagoricienne* (Biblioth. de l'École des Hautes Études, Sciences histor. et philol. 217) (Paris, 1915), pp. 133–134, 259–264, 276; F. Cumont, *Recherches sur le symbolisme funéraire des Romains* (Biblioth. archéol. et histor. des Antiquités de Syrie et du Liban 35) (Paris, 1942), pp. 23 and 328–331; E. Kuiser, "Odyssee-Szenen als Topoi," *Museum helvet.* 21 (1964), pp. 114–115. P. Boyancé, "Études philoniennes," *Revue des études grecques* 76 (1963), pp. 76–77, draws attention to a similar exegesis of the same origin (it is in fact simply a literary rapprochement, and not an allegory) in Philo *Quaest. in Gen.* III 3. The Pythagoreans also developed a more banal interpretation in which the murderous songs of the Sirens represent sensual pleasures: cf. Porphyry *Vita Pythag.* 39 and Clement of Alexandria *Strom.* I 10, 48, 6.
9. Cf. A. Delatte, *op. cit.*, pp. 128ff., 129: "Il semble que tous les mythes et toutes les légendes de l'*Odyssée* en particulier furent traités par l'interprétation symbolique." We must admit that we lack sufficiently well-established facts about this Pythagorean Ulysses, despite the efforts of M. Detienne, "Ulysse sur le stuc central de la Basilique de la Porta Maggiore," *Latomus* 17 (1958), pp. 270–286, and especially Homère, *Hésiode et Pythagore. Poésie et philosophie dans le pythagorisme ancien* (Collection Latomus 57) (Bruxelles, 1962), pp. 52–60.
10. See the discussion between Socrates and Hippias in Plato *Hippias min.* where we meet again with Antisthenes' preoccupations. The discussion in fact has to do with a quotation from *Iliad* IX 308–314 (365AB).
11. Notably in the episodes of Calypso (*Od.* v 55–269; vii 241–267), Circe (x 210–574; xii 8–143), the Sirens (xii 39–54 and 158–200), Charybdis and Scylla (xii 73–126 and 222–262).
12. Proclus *In Plat. Rempubl.* ed. Kroll, I, p. 131, 7–8 thus mentions those who "transpose to other deeper meanings (ἐπ' ἄλλας ἱστορίας) what is called the wandering" of Ulysses.
13. This difference impressed I. Heinemann, "Die wissenschaftliche Allegoristik der Griechen," *Mnemosyne* IV a ser., 2 (1949), pp. 15–16 who opposes Numenius to Heraclitus *Quaest. homer.* 70 (note that this last text contains several instances of the word "allegory", but it relates to a moral allegory on the surface of the text).
14. *Enn.* I 6 [I] 8, 16–21, ed. Henry-Schwyzer, p. 102; the first words Φερίωμεν . . . φίλην ἐς πατρίδα come from *Iliad* II 140 = IX 27 where they are spoken by Agamemnon, but φίλην ἐς πατρίδα is also found, in relation to Ulysses, in *Od.* v 37. There is a possible allusion to the return of Ulysses to his fatherland after much wandering in *Enn.* V 9 [5] I, 20–21.
15. *In Plat. Parmen.* V, ed. Cousin, col. 1025, 33–37; the mention of Ulysses is induced by the word πλάνη in *Parm.* 136E2.
16. *Ibid.*, col. 1025, 1–33.
17. *In Plat. Crat.* 158, ed. Pasquali, p. 88, 20–23; the passage commented on is *Crat.* 403DE, which has to do with the Sirens of Hades (Proclus distinguishes them from those of *genesis*). There are comparable texts, including the reference to the *Phaedrus*, in Proclus *In Rempubl.* II, p. 68, 3–16 and especially p. 238, 23–26: ". . . τῶν γενεσιουργῶν . . . Σειρήνων, ἃς δὴ καὶ αὐτὸς (Plato) ἄλλαχού συμβουλεύει κατὰ τὸν Ὀμηρικὸν ἐκείνῳ Ὀδυσσεῖ παραπλεῖν." See Festugière's notes *ad loc.*, vol. III, p. 195. Proclus' word θέλειν, "to bewitch," is already applied to the Sirens at *Od.* xii 40 and 44. On the sea as image of coming-to-be, see Proclus *In Plat. Tim.* ed. Diehl, I, p. 113, 30–31: τὴν εἰς τὸν πόντον τῆς γενέσεως . . . τῆς ψυχῆς φορὰν; Julian *Orat. VIII In Matrem deor.* 9, 169D: the soul flees γένεσιν καὶ τὸν ἐν αὐτῇ κλύδωνα; F. Cumont, *op. cit.*, p. 66 n. 1 and p. 326.
18. *Comment. ad Hom. Odysseam* I 51, 1389, Leipzig ed. (Weigel, 1825) I, p. 17, 9–16; see for more details F. Buffière, *op. cit.*, pp. 461–464. The most remarkable aspect of this passage is its skill in combining Homeric and Platonic themes: the body as "envelope" (ἐλυτρον) comes from *Republ.* IX 588E; but the assimilation of the enveloped soul to a pearl (μάργαρον) connects with the

- comparison with the oyster in *Phaedrus* 250C: the island surrounded by currants (νήσω ἐν ἀμφιρύτῃ) of *Od.* i 50 evokes for the commentator *Timaeus* 43A on the body which receives and excretes a liquid flux (ἐπιρρυντον σῶμα καὶ ἀπόρρυντον), etc.
19. 259AB: παραπλέοντας σφας ὥστερ Σειρήνας ἀκηλήτους, ὃ γέρας παρὰ θεῶν ἔχουσιν ἀνθρώποις διδόναι ταχ' ἂν δοίεν.
  20. Hermias *In Plat. Phaedrum schol.* 259A, ed. Couvreur, p. 214, 4–24: the words between square brackets give mostly the restitutions or clarifications in Couvreur's apparatus. For the idea that the true fatherland of the souls is the intelligible world, see already *ad* 230CD, p. 32, 26.
  21. *In Crat.* p. 88, 20–23 and *In Rempubl.* II, p. 238, 23–26; cf. *supra* p. 5 and note 17.
  22. This is the case for Proclus himself, *In Rempubl.* II, p. 68, 11 παραπλεύσεται; the verb here is intransitive, as it often is; it can also have an object in the accusative as we have seen in Hermias and in Proclus following *Phaedrus* 259A: παραπλέοντας σφας.
  23. Thus H. Dunbar, *A Complete Concordance to the Odyssey of Homer* (Oxford, 1880; Hildesheim<sup>2</sup>, 1962 ed. B. Marzullo), p. 293B; A. Gehring, *Index homericus* (Leipzig, 1891–1895; Hildesheim-New York<sup>2</sup>, 1970 ed. U. Fleischer), col. 656.
  24. In xii 69, where the ship *Argo* alone sailed past (παρέπλω) the Wandering Rocks. Yet here the verb is used in its Ionian form παραπλώω.
  25. Porphyry *De antro nymph.* 34, ed. Westerink, p. 32, 13–21. The two verses quoted are *Od.* xi 122–123. The reference to Numenius is *Testim.* 45 Leemans, pp. 103, 25–104, 2, = Fragment 33 des Places, p. 84. The word ἀποκαθισταμένον, which denotes a reestablishment in a former state, has been studied by W. Theiler, *Forschungen zum Neuplatonismus* (Quellen und Studien zur Geschichte der Philos. X) (Berlin, 1966), p. 27 and n. 48, and *Untersuchungen zur antiken Literatur* (Berlin, 1970), p. 536: he attempts to show that the well-known *apocatastasis* doctrine in Origen derives to some degree from Numenius, via Ammonius Saccas.
  26. *Ibid.* 35, pp. 32, 29–30 and 34, 4–7. Ulysses' "audacity" is to have blinded the Cyclops, hence Poseidon's hate (*Od.* i 68–75), which is to say: one does not free oneself of the life of the senses by blinding it in one blow. P. 34, 5 ἐν ψυχαῖς ἀπείροις, "with people who do not know . . .", is Westerink's correction of the MS reading ἑμψυχος ἀπείρων and of the reading ἀπείρος given by Hercher followed by Nauck; it has the advantage of harmonizing better with *Od.* xi 122–129 and with ch. 34 of the *De antro*, where it is the people among whom Ulysses must arrive, and not obviously Ulysses himself, who know so little of the sea as to make the mistake in question.
  27. Thus, in the geographical myth toward the end of the *Phaedo*, we find a devaluation of the sea, a place of corruption, imperfection, ugliness, decay (110A and E); in *Republ.* X 611B–612A the soul, joined to the body, is disfigured like the submerged statue of Glaucus, and will only show her true nature by leaving the sea (ἐκ τοῦ πόντου) in which she is; in *Laws* IV 704D–705A the proximity of the sea (θάλαττα) ruins morals; etc.
  28. 273D: εἰς τὸν τῆς ἀνομοιότητος ἀπειρον ὄντα πόντον (τόπον codd.); the whole context is ostensibly nautical: the Demiurge is described at length as a pilot who moves between the tiller and his observation post. One can understand then why πόντον would have been substituted for the supposedly authentic τόπον, whereas the reverse change would be harder to explain. The Neoplatonists in any case generally read πόντον. For the comparison, see J. B. Skemp, *Plato's Statesman* (London<sup>2</sup>, 1961), pp. 95–97. For the relation with *De antro* 34, see F. Cumont, *op. cit.*, p. 500.
  29. Thus Proclus *In Tim.* I, p. 179, 25–26: . . . ὅλη, ἣν ἀνομοιότητος πόντον ἐν τῷ Πολιτικῷ προσείρηκε [sc. Plato], and pp. 174, 10–11; 175, 18–20 (178, 15–16), etc.
  30. We must note here a very similar image in a text which, by all accounts, is important to Porphyry. It is the alleged oracle of Apollo which he quotes in his *Life of Plotinus*. If Ulysses is not named in this text, his figure can be read between the lines, for in this text victory over corporeal subjection is assimilated to a swift swim to the coast; the nausea and dizziness produced by carnal food are compared to sea sickness. Plotinus' striving for salvation is presented as an escape from the bitter waves, in the midst of the billows (ἐν μεσάτοις κλύδωνος) (*Vita Plot.* XXII 25–27 and 31–33).
  31. Numenius Fr. 27 L., pp. 141, 16–142, 2 = Fr. 18, 2–10 des Pl., pp. 58–59, = Eusebius *Præ- evang.* XI 18, 24, in particular *in fine*: "The Demiurge resides over her (i.e., matter) as if above a ship on that sea which is matter" (thus I think one should translate, in the light of the reference to Plato in the preceding fragment and keeping the received text: αὐτὸς μὲν ὑπὲρ ταύτης ἵδρυται, οἷον ὑπὲρ νεὼς ἐπὶ θαλάττης, τῆς ὕλης). This is an actual quotation from Book VI of Numenius' treatise *On the Good*.
  32. As thinks J. F. Kindstrand, *Homer in der Zweiten Sophistik. Studien zu der Homerlektüre und dem Homerbild bei Dion von Prusa, Maximus von Tyros und Ailius Aristides* (Acta Univ. Upsal., Studia Graeca 7) (Uppsala, 1973), pp. 179–180.
  33. ὑποβαλοῦσα, a reading proposed with reason by J. F. Kindstrand, *op. cit.*, p. 179 n. 81 instead of Hobein's ὑπολαβοῦσα.
  34. Maximus of Tyre *Philos.* XI 10 h (= XVII 10 Dübner), ed. Hobein, p. 142, 8–12.
  35. J. Huskinson, "Some Pagan Mythological Figures and their Significance in Early Christian Art," *Papers of the British School at Rome* 42 (1974), pp. 80–81 has shown, à propos of the scene of Ulysses and the Sirens in early Christian art, that in most cases it is a re-use of pagan images by Christians in decorating their churches. For the same scene in early Christian art and its interpretation in the light of pagan and Christian literary documents, see T. Klauser, "Studien zur Entstehungsgeschichte der christlichen Kunst," VI, in *Jahrbuch für Antike und Christentum* 6 (1963) pp. 71–100.
  36. The principal work on the Christian allegories of this episode is H. Rahner, *Symbole der Kirche. Die Ekklesiologie der Väter* (Salzburg, 1964), pp. 247–267; see also, by the same author, "Antenna crucis, I: Odysseus am Mastbaum," *Zeitschrift für katholische Theologie* 65 (1941), pp. 123–152. See also, especially for the Latin Fathers, P. Courcelle, "Quelques symboles funéraires du néo-platonisme Latin. Le vol de Dédale.—Ulysse et les Sirènes," *Revue des études anciennes* 46 (1944), pp. 73–91 (he gives also many details about pagan Neoplatonic exegesis); and again, by the same author, "L'interprétation évhémériste des Sirènes—courtisanes jusqu'au XII<sup>e</sup> siècle," in *Mélanges L. Wallach* (Monographien zur Geschichte des Mittelalters 11) (Stuttgart, 1975), pp. 33–48.
  37. Clement of Alexandria *Protrept.* XII 118, 1–4, ed. Stählin, p. 83, 8–30. I have profited by Mondésert's translation in the "Sources chrétiennes" series, 2. The prose quote at the end of the text comes from I Cor. 2:9. The last of the three poetical quotes is pure ornament and comes from Hesiod *Works* 373–374. The first two, on the other hand, are taken from *Od.* xii 219–220 and 184–185 (at 185 θειοτέρην, a "more divine" voice, is substituted for the νουτέρην of the text, "our" voice). There is furthermore an allusion to verses 45–46 (the island crowded with human bones) and 178 (Ulysses tied to his mast). This is good confirmation that Clement is really developing an exegesis of the Homeric episode.
  38. *Protrept.* X 109, 1, p. 77, 29–30; same opposition at X 89, 2 and 99, 3, as well as at XII 118, 1. On the word as applied to the cult of idols, see IV 46, 1; X 99, 1; 101, 1 and 3. These texts are referred to by H. Rahner, *op. cit.*, pp. 254–255.
  39. L. Alfonsi, "La Consuetudo nei Protreptici," *Vigiliae christ.* 18 (1964), pp. 32–36 gives several examples of this; let us make note of Cicero *Hortensius* Fr. 63 Ruch p. 134 (*consuetudo vitiosa*), Seneca *De ira* II 20, 2: plurimum potest consuetudo, quae si gravis est alit vitium.
  40. *Protrept.* IX 86, 2, p. 64, 27–37. This text has been very well analyzed by M. L. Amerio, "Su due similitudini del Protreptico di Clemente Alessandrino (*prot.* 9, 86, 2)," *Invisitata lucernis* (Bari), 1 (1979), pp. 7–37.
  41. I have drawn in this analysis from M. L. Amerio, *art. cit.*, especially pp. 12, 21–24 and 28–32 where a complete study may be found.
  42. *Strom.* VI 11, 89, 1–3, ed. Stählin, p. 476, 14–26; the quotation in brackets is from Psalm 23, 1. = I Cor. 10:26; it expresses at the same time the fact that Christian recruitment does not have ethnic limitations and that all knowledge is at the service of the faith. See the commentary on this text in A. Méhat, *Étude sur les 'Stromates' de Clément d'Alexandrie* (Patristica sorbonensia 7) (Paris, 1966), pp. 67, 132–133, 287, 327.
  43. Thus Paulinus of Nola (fourth to fifth century) *Epist.* XVI (*ad Jovium philosophum*) 7, ed. Hartel, pp. 121, 6–122, 2, cited by P. Courcelle, *art. cit.*, p. 89.
  44. Like [Justin] *Cohort. ad gentiles* (date uncertain) 36, ed. Otto, pp. 116–118: Plato and Aristotle seduce only by their δοκιμότης φράσεως and their εὐγλωττία; let us stop our ears with wax so as to escape the sweet death produced by these Sirens. One will note that Clement himself had

- recourse to the Sirens in order to denounce the magic of Sophists and the leading of the soul based on the charm of language; let us not repeat the trial of Ulysses, "it is quite enough for one man to have had to sail past the Sirens (Σειρήνας δὲ παραπλεύσας)" (*Strom.* I 10, 48, 6, p. 32, 8–10). On these texts see H. Rahner, *op. cit.*, pp. 255–256.
45. Hippolytus *Elenchus* VII 13, 1–3, ed. Wendland, pp. 190, 21–191, 11.
  46. Cf. *supra* p. 11 and V. Buchheit, "Homer bei Methodios von Olympos," *Rheinisches Museum* 99 (1956), pp. 19–23.
  47. Methodius *De autexuio* I 1–5, ed. Bonwetsch, pp. 145, 3–147, 1.
  48. Ambrose *Expos. in Lucam* IV 2–3, ed. Schenkl, pp. 139, 12–141, 3; the connection with the text of Luke seems very loose.
  49. Isaiah 13:21; there are thus "Sirens" in the Septuagint and in the Latin translation of the Old Testament read by Ambrose, but Jerome dared to use the word only once in the Vulgate, as Is. 13:22; cf. P. Antin, "Les Sirènes et Ulysse dans l'oeuvre de saint Jérôme," *Revue des études lat.* 39 (1961), pp. 232–234; E. Kaiser, *art. cit.*, p. 126.
  50. *Sermo XXXVII* 1–3, lines 1–43, ed. Mutzenbecher, pp. 145–146, = *Homilia* 49, Migne *Patrologia latina* 57, 339B–340B.
  51. This is the case in Augustine; see my work "Ex Platoniorum persona", *Études sur les lectures philosophiques de saint Augustin* (Amsterdam, 1977), p. xiii.
  52. Besides *Protrept.* XII 118, 3, see *Strom.* I 10, 48, 6, quoted *supra* note 44.
  53. *Nigrinus* 19: one must, imitating Ulysses, sail past (παραπλεῖν) the seductions of Roman life, but without binding one's hands or stopping one's ears with wax, so as to hold them, in full knowledge and liberty, in contempt. Every opinion on this point is of course full of uncertainty, given the lack of any collection of references which is near being exhaustive. I base myself on the rich repertory in E. Kaiser, *art. cit.*, where one finds seven instances of παραπλεῖν applied to the Sirens (pp. 128, 130, 131, 132, 134, 135, 136). If we eliminate the instances where this verb means "sail beside," and not "avoid," there remain only four texts of which two only are early enough to be of interest to our inquiry, one in Philostratus (*Heronius* 11), who must be a little later than Clement, and that in Lucian, who must be a little earlier.
  54. For the connection of the theme of flight with that of the return to the fatherland, see H. Merki, 'ΟΜΟΙΩΣΙΣ ΘΕΩ *Von der platonischen Angleichung an Gott zur Gottähnlichkeit bei Gregor von Nyssa* (Paradosis VII) (Freiburg/Schweiz, 1952), p. 127, Hermias, *loc. cit.*, p. 214, 22 does not have φεύγωμεν, but has ἐκφεύγοντα τὴν Κίρκην, etc.
  55. Clement, *loc. cit.*, p. 83, 21: παρίθι τὴν ἡδονήν; Hermias, p. 214, 9–10: παρερχόμεθα τὸν ἐνταῦθα βίον.
  56. See on this theme the classic article by C. Bonner, "Desired Haven," *Harvard Theological Review* 34 (1941), pp. 49–67.
  57. *In Parmen.* V, col. 1025, 36–37.
  58. See the title of the article by I. P. Culianu cited *supra* p. 235, n. 7.
  59. Cf. P. Reymond, *L'eau, sa vie et sa signification dans l'Ancien Testament* (Supplements to *Vetus Testamentum* VI) (Leiden, 1958), pp. 123–124 and 182–198.
  60. Thus Origen *Hom. in Gen.* I 10; *Hom. in Levit.* VIII 3; *In Epist. ad Rom.* 5, 10; Ambrose *De fide* V 2, 31; *Expos. in Lucam* IV 40. I take these references from H. Rahner, *op. cit.*, pp. 291–292.
  61. *Op. cit.*, p. 253, where indeed no reference is made to Hermias.
  62. Origen *Fr.* 95–96 *In Thren.* 4, 3, ed. Klosternmann p. 270, 2–12: τὰς κατὰ Σύμμαχον Σειρήνας ἀκούσει τὰ πονηρὰ πνεύματα . . . Κατὰ γὰρ τὸν ἔξω μῦθον αὐταὶ διὰ τῆς ἡδονῆς τοὺς προστυχόντας ἀπώλλουσιν.
  63. P. Boyancé, "Écho des exégèses de la mythologie grecque chez Philon," in *Philon d'Alexandrie. Actes du colloque de Lyon 1966* (Paris, 1967), p. 170.
  64. Hippolytus *Elenchus* VI 15, 4–16, 2, ed. Wendland, pp. 141, 22–142, 5; this concerns *Od.* x 286–306.
  65. *Ibid.*, V 7, 30–32, pp. 85, 23–87, 3, on which see H. Leisegang, *La gnose*, French trans. (Biblioth. histor.) (Paris, 1951), pp. 89–90; the Homeric passage is *Od.* xxiv 1–5; ἀνεμνησμένων, a word-play with μνηστήρες, "suitsors."
  66. Proclus *In Rempubl.* II, p. 351, 7–17, a reference given by the editor Wendland, p. 86.
  67. J. Carcopino, *De Pythagore aux Apôtres. Études sur la conversion du monde romain* (Paris, 1956), especially pp. 177, 188, 211–213.
  68. As thinks W. Foester, intro. to *The Exegesis on the Soul*, in R. McL. Wilson (ed.), *Gnosis* vol. II (Oxford, 1974), p. 103.
  69. *The Exegesis on the Soul* ed. M. Krause and P. Labib, *Gnostische und Hermetische Schriften aus Codex II und Codex VI* (Glückstadt, 1971), pp. 85–86, = p. 136, 26–35 of the Codex. What is given as a quotation from Homer is based on a compilation of several passages from *Od.* i 55–59 (Ulysses weeps and wants to see again the smoke of Ithaca), iv 555–558 (on Calypso's island, Ulysses weeps at not being able to return to his fatherland), v 82–83 and 151–158 (each day Ulysses weeps sitting on the cape), v 219–220 (Ulysses wants to return), xiii 299–301 (Athena never stopped helping Ulysses), etc.
  70. Epictetus *Discourses* III 24, 18–21, notably: "if Ulysses cried and lamented, he was not a noble man."
  71. See the excellent article by M. Scopello, "Les citations d'Homère dans le traité de L'exégèse de l'âme," in M. Krause (ed.), *Gnosis and Gnosticism* (Nag Hammadi Studies VIII) (Leiden, 1977), p. 3; the treatise is "une exposition du mythe gnostique de l'âme déchue dans le monde"; the purpose of the biblical and Homeric quotations is to "justifier le thème gnostique de la remontée de l'âme au Plérôme."

#### ORIGEN'S DOCTRINE OF THE TRINITY AND SOME LATER NEOPLATONIC THEORIES

1. *Ep. ad Menam*, p. 208, 26–32 Schw. = Fr. 9 Koetschau.
2. *Ep.* 124, 2, p. 98, 1–6 Hilberg.
3. 'Εκ τοῦ πρώτου λόγου τοῦ Πατρὸς ἀρχῶν βιβλίου. ὅτι ὁ μὲν θεὸς καὶ πατὴρ συνέχων τὰ πάντα φθάνει εἰς ἕκαστον τῶν ὄντων, μεταδίδους ἕκαστῳ ἀπὸ τοῦ ἰδίου τὸ εἶναι ὅπερ ἐστίν, ἐλαττόνως δὲ παρὰ τὸν πατέρα ὁ υἱὸς φθάνων ἐπὶ μὴν τὰ λογικά (δεύτερος γὰρ ἐστὶ τοῦ πατρὸς), ἐπὶ δὲ ἡττόνως τὸ πνεῦμα τὸ ἅγιον ἐπὶ μόνους τοὺς ἁγίους διακονοῦμενον ὥστε κατὰ τοῦτο μείζων ἡ δύναμις τοῦ πατρὸς παρὰ τὸν υἱὸν καὶ τὸ πνεῦμα τὸ ἅγιον, πλείων δὲ ἡ τοῦ υἱοῦ παρὰ τὸ πνεῦμα τὸ ἅγιον, καὶ πάλιν διαφέρουσα μᾶλλον τοῦ ἁγίου πνεύματος ἡ δύναμις παρὰ τὰ ἄλλα ἅγια.
4. "Filium quoque minorem a patre eo quod secundus ab illo sit, et spiritum sanctum inferiorem a filio in sanctis quibusque versari, atque hoc ordine maiorem patris fortitudinem esse quam filii et spiritus sancti, et rursum maiorem filii fortitudinem esse quam spiritus sancti, et consequenter ipsius sancti spiritus maiorem esse virtutem ceteris, quae sancta dicuntur."
5. "Arbitror igitur operationem quidem esse patris et filii tam in sanctis quam in peccatoribus, in hominibus rationabilibus et in mutis animalibus, sed et in his, quae sine anima sunt, et in omnibus omnino quae sunt; operationem vero spiritus sancti nequaquam prorsus incidere vel in ea, quae sine anima sunt, vel in ea, quae animantia quidem sed muta sunt, sed ne in illis quidem inveniri, qui rationabiles quidem sunt sed 'in malitia positi' nec omnino ad meliora conversi. In illis autem solis esse arbitror opus spiritus sancti, qui iam se ad meliora convertunt et 'per vias Christi Iesu' incedunt, id est qui sunt 'in bonis actibus' et 'in deo permanent.'"
6. The former question is well discussed in an article by Manlio Simonetti, "Sull' interpretazione di un passo del *De Principiis* di Origene (I 3, 5–8)," in *Riv. di Cult. Class. e Med.* 6 (1964), pp. 15–32, but he does not concern himself with possible Platonic analogies.
7. Πάν αἴτιον καὶ πρὸ τοῦ αἰτιατοῦ ἐνεργεῖ καὶ μετ' αὐτὸ πλείονων ἐστὶν ὑποστατικόν, εἰ γὰρ ἐστὶν αἴτιον, τελειότερόν ἐστι καὶ δυνατότερον τοῦ μετ' αὐτό, καὶ εἰ τοῦτο, πλείονων αἴτιον, δυνάμει γὰρ μείζονος τὸ πλείον παράγειν, ἴσης δὲ τὰ ἴσα, καὶ τῆς ἐλάττονος ἐλάττω καὶ ἡ μὲν τὰ μείζονα ἐν τοῖς ὁμοίοις δυνάμει δύναμις καὶ τὰ ἐλάττονα δύναται, ἡ δὲ τὰ ἐλάττονα δυνάμει οὐκ ἐξ ἀνάγκης τὰ μείζονα δυνήσεται, εἰ οὖν δυνατότερον τὸ αἴτιον, πλείονων ἐστὶ παρακτικόν.

ἀλλὰ μὴν καὶ ὅσα δύναται τὸ αἰτιατόν, μειζόνως ἐκεῖνο δύναται. πᾶν γὰρ τὸ ὑπὸ τῶν δευτέρων παραγόμενον ὑπὸ τῶν προτέρων καὶ αἰτιωτέρων παράγεται μειζόνως, συνυφίστησιν ἅρα αὐτῷ πάντα ὅσα πέφυκε παράγειν.

εἰ δὲ καὶ αὐτὸ πρότερον παράγει, δῆλον δῆπουθεν ὅτι πρὸ αὐτοῦ ἐνεργεῖ κατὰ τὴν παρακτικὴν αὐτοῦ ἐνεργειαν. ἔστιν ἅρα αἴτιον καὶ πρὸ τοῦ αἰτιατοῦ ἐνεργεῖ καὶ σὺν αὐτῷ καὶ μετ' αὐτὸ ἄλλα ὑφίστησιν.

ἐκ δὴ τούτων φανερόν ὅτι ὥσων μὲν αἰτία ψυχὴ, καὶ νοῦς αἴτιος, οὐχ ὥσων δὲ νοῦς, καὶ ψυχὴ αἰτία' ἀλλὰ καὶ πρὸ ψυχῆς ἐνεργεῖ, καὶ ἃ δίδωσι ψυχὴ τοῖς δευτέροις, δίδωσι καὶ νοῦς μειζόνως, καὶ μηκέτι ψυχῆς ἐνεργοῦσης νοῦς ἐλλάμπει τὰς ἑαυτοῦ δόσεις, οἷς μὴ δέδωκε ψυχὴ ἑαυτήν, καὶ γὰρ τὸ ἀψυχον, καθόσον εἶδους μετέσχε, νοῦ μετέχει καὶ τῆς τοῦ νοῦ ποιήσεως.

καὶ δὴ καὶ ὥσων νοῦς αἴτιος, καὶ τὸ ἀγαθὸν αἴτιον' οὐκ ἐμπαλιν δέ, καὶ γὰρ αἱ στερήσεις τῶν εἰδῶν ἐκεῖθεν (πάντα γὰρ ἐκεῖθεν), νοῦς δὲ στερήσεως ὑποστάτης οὐκ ἔστιν, εἶδος ὢν.

8. τὸ γὰρ ἐν καὶ ὑπὲρ τὸ ὄν καὶ σὺν τῷ ὄντι καὶ ἐπὶ τὰδε τοῦ ὄντος, ὡς ἐπὶ τῆς ὕλης καὶ τῆς στερήσεως.
9. *Did.* ch. X. 2: τούτου δὲ (sc. the Active Intellect) καλλίων ὁ αἴτιος τούτου καὶ ὅπερ ἂν ἐτι ἀνώτερω τούτων ὑφέστηκεν. οὗτος ἂν εἴη ὁ πρῶτος θεός. . . .
10. *Fr.* 15 *Des Places*: ὁ μὲν πρῶτος θεός . . . ἐστὶς. The πρῶτος νοῦς is also termed αὐτόον in *Fr.* 17, as being an object of contemplation for the Demiurge.
11. Alex. Aphrod. *In Metaph.* p. 59, I Hayduck, *ad Met.* 988a10–11.
12. *Fr.* 34 *Des Places*: "Ἰνθέν ἀποθοφσκει γένεσις πολυποικίλων ὕλης. Matter is also described as πατρογενής by Psellus in his *Hypotyposis*, sect. 27, p. 201 *Des Places*.
13. *In Alc.* p. 110, 13ff. Creuzer = lambl. *In Alc.* *Fr.* 8 Dillon.
14. Amelius, e.g., *In Tim.* *Fr.* 39; *Fr.* 54; *Fr.* 57 (with Numenius); Porphyry, *Fr.* 16; *Fr.* 70, Dillon.
15. *Expos. Chald.* 1153a10–11, p. 191 *Des Places*: συμπαθῇ δὲ τὰ ἄνω τοῖς κάτω φασὶ καὶ μάλιστα τὰ ὑπὸ σελήην.

#### A NEOPLATONIC COMMENTARY ON THE CHRISTIAN TRINITY: MARIUS VICTORINUS

21. *Ciu. Dei* XXII. 29.

#### SOME LATER NEOPLATONIC VIEWS ON DIVINE CREATION AND THE ETERNITY OF THE WORLD

1. W. Wieland, "Die Ewigkeit der Welt," in *Die Gegenwart der Griechen im neueren Denken* (Tübingen, 1960), p. 293: "Noch bei seinem Übertritt zum Christentum macht er den Vorbehalt, es sei ihm unmöglich, in allen Punkten der christlichen Lehre zuzustimmen: zu denjenigen Punkten, die er von seiner bisherigen philosophischen Überzeugung auf keinen Fall aufgeben zu können glaubt, gehört die Lehre von der Ewigkeit der Welt."

2. L. G. Westerink, *Anonymous Prolegomena to Platonic Philosophy* (Amsterdam, 1962), pp. xv-xx.
3. L. G. Westerink, *op. cit.*, pp. xxiii-xxiv. According to Westerink, Elias "is clearly unwilling to abandon the old belief (viz., the eternity of the world)," whereas David and Stephen mention this doctrine without dismissing it. According to A. Cameron ("La fin de l'Académie," in *Le Néoplatonisme* [Paris, 1971], p. 282), the influence of Philoponus' teaching on the Alexandrian school was rather weak: "Olympiodore qui enseignait encore à Alexandrie dans les années 560, était en effet païen, et ses successeurs Élie, David, Étienne, bien que chrétiens, continuèrent à enseigner des doctrines comme l'éternité du monde et la divinité des corps célestes, qui avaient déjà été depuis longtemps réfutées par Philopon."
4. H. D. Saffrey, "Le chrétien Jean Philopon et la survivance de l'École d'Alexandrie au VI<sup>e</sup> siècle," *Revue des études grecques* LXVII (1954), p. 406.
5. H. D. Saffrey, *art. cit.*, p. 397. After the death of Proclus there was some contention between Marinus who represented the Aristotelian trend and Isidorus who sided with the Platonic tendency.
6. H. D. Saffrey, *art. cit.*, p. 400; L. G. Westerink, *Anonymous Prolegomena*, p. xi.
7. W. Wieland, *art. cit.*, p. 300.
8. L. G. Westerink, *Anonymous Prolegomena*, p. xii.
9. Simplicius, *In Phys.* VIII, 10, p. 1363, 8 (*Commentaria in Aristotelem graeca* [CAG], vols. IX-X).
10. L. G. Westerink, *Anonymous Prolegomena*, pp. xv-xx.
11. H. D. Saffrey, *art. cit.*, p. 403.
12. H. D. Saffrey, *art. cit.*, p. 401.
13. Cf. W. Wieland, *art. cit.*, p. 303. The sentence in question ( *nihil ex nihilo*) is considered to be well known, notorious among physicists (*πολυθρόνητον ἄξιωμα*).
14. This position was firmly maintained by Proclus: in his view whatever comes to be must proceed from prime matter: cf. Philoponus, *De aeternitate mundi contra Proclum*, ed. H. Rabe (Leipzig, 1899), p. 455, 26.
15. Philoponus, *In Phys.* I, 3, p. 54, 8ff. (CAG XVI-XVII); cf. *De aeternitate mundi*, p. 458, 7ff.
16. Simplicius, *In Phys.* VIII, 1, pp. 1141-1142; cf. *De aeternitate mundi*, p. 344, 18.
17. Cf. *De aeternitate mundi*, pp. 64, 22; 367, 16; 368, 1.
18. Philoponus, *In Phys.* I, 9, p. 191, 9ff.; in his *De aeternitate mundi* also Philoponus endeavors to clarify the notion of divine creation: the author emphasizes the fact that God does not use any instrument when performing his creative activity (p. 76, 21) and that the divine substance does not become more perfect by producing the world; the cosmos does not contribute to the perfection of the Creator (p. 21, 1 and 21, 14). Both views are very interesting from a metaphysical viewpoint: they are clearly intended to show how creation has to be considered as an integral or transcendental causation.
19. Philoponus, *In Phys.* III, 5, p. 428, 23ff.
20. Philoponus, *In Phys.* III, 5, p. 429.
21. Philoponus, *In Phys.* III, 5, p. 458, 30; IV, 13, p. 762, 5-9.
22. E. Évrard, "Les convictions religieuses de Jean Philopon et la date de son commentaire aux 'Météorologiques,'" *Acad. royale de Belgique, Bulletin de la Classe des Lettres*, 39 (1953), pp. 300-301; cf. W. Wieland, *art. cit.*, p. 301.
23. Simplicius, *In Phys.* VIII, 1, p. 1130, 7ff.
24. Simplicius, *In Phys.* VIII, 1, p. 1133.
25. One of the arguments developed by Proclus in order to prove the eternity of the world starts from the Platonic definition of the soul. By its very nature the soul is a principle of movement and because it always exists, it necessarily causes an eternal movement: consequently the world must be constantly in movement, without beginning and without end. Philoponus however disagrees on this Platonic definition of the soul: the very essence of the soul could not be self-movement (*De aeternitate mundi*, p. 248, 19). If it belonged to the nature of the soul to move corporeal reality, then the psychic principle would depend on something lower and could not exist independently of the body. Moreover, the fact that the soul is able to move does not entail that it actually always moves (*De aeternitate mundi*, pp. 252ff.).
26. Simplicius, *In Phys.* VIII, 1, p. 1178, 9ff.
27. Simplicius, *In Phys.* VIII, 1, p. 1179.
28. Simplicius, *In Phys.* VIII, 1, p. 1179.
29. According to the *Timaeus* (32C and 41AB) of Plato, the Demiurge will never destroy the world: it would undoubtedly be wrong to pull down such a harmonious whole as the cosmos.
30. Simplicius, *In Phys.* VIII, 10, p. 1327.
31. Simplicius, *In Phys.* VIII, 10, p. 1329. According to Philoponus even the heavenly bodies are perishable by nature: they may however continue to exist indefinitely as a result of a divine decision: cf. *De aeternitate mundi*, p. 598, 7.
32. Simplicius, *In Phys.* VIII, 1, p. 1167.
33. Simplicius, *In Phys.* VIII, 1, p. 1163: Proclus contends that time must be eternal because it has been made according to an eternal pattern. In Philoponus' view the world could not reproduce in a perfect way the model according to which it has been made: there is always some distance between a perfect pattern and its imitation (*De aeternitate mundi*, p. 551, 8). As to the use of temporal terms, Philoponus points to the fact that we often use such words without implying any temporal meaning; we use them even when speaking about God (*De aeternitate mundi*, p. 117, 13).
34. Simplicius, *In Phys.* VIII, 1, pp. 1157-1158.
35. Simplicius, *In Phys.* VIII, 1, p. 1158.
36. Simplicius, *In Phys.* VIII, 1, p. 1164.
37. Simplicius, *In Phys.* VIII, 1, pp. 1141-1142; cf. *De aeternitate mundi*, p. 367, 16.
38. Simplicius, *In Phys.* VIII, 1, p. 1142; cf. *De aeternitate mundi*, p. 458, 7.
39. Simplicius, *In Phys.* VIII, 1, p. 1141; cf. *De aeternitate mundi*, p. 76, 21ff.
40. A. Cameron, *art. cit.*, p. 289.
41. Simplicius, *In Phys.* VIII, 1, p. 1166.
42. Simplicius, *In Phys.* VIII, 1, p. 1164. According to Simplicius all philosophers, except Plato, accept movement as eternal.
43. Simplicius, *In Phys.* VIII, 1, p. 1131.
44. Simplicius, *In Phys.* VIII, 1, p. 1135.
45. Simplicius, *In Phys.* VIII, 1, p. 1136.
46. Simplicius, *In Phys.* VIII, 1, p. 1180.
47. Simplicius, *In Phys.* VIII, 1, pp. 1180-1181.
48. Simplicius, *In Phys.* VIII, 1, p. 1165. Proclus already contends that, the pattern of the world being eternal, the world itself must be eternal too (*De aeternitate mundi*, pp. 24, 14; 550, 18). The reply of Philoponus is twofold: he firstly points to the fact that the Platonic doctrine of the Ideas is rather controversial and has actually been opposed by Aristotle. Moreover, the very essence of the Ideas is not that they are the patterns of sensible reality. In Philoponus' view the Ideas are self-sufficient and could perfectly exist without any relation to something else (*De aeternitate mundi*, p. 35, 6).
49. Simplicius, *In Phys.* VIII, 1, p. 1163.
50. Simplicius, *In Phys.* VIII, 1, p. 1168.
51. Simplicius, *In Phys.* VIII, 1, p. 1151. According to Philoponus the starting of creation does not involve any change in the divine perfection: it is not situated in a temporal dimension and is consequently not a movement; besides it is not a passage from potency to act, but a transition from an habitual (*ἐξής*) disposition to act, which can occur without being produced by something else (*De aeternitate mundi*, pp. 51ff.).

61. W. Wieland, *art. cit.*, p. 315: "Denn das zeichnet ja Philoponus von den anderen Christen der Spätantike aus, dass er die zeitliche Endlichkeit der Welt nicht als Glaubenssatz hinnimmt, sondern sie gerade im Rahmen der aristotelischen Begrifflichkeit zu beweisen versucht."

### JOHN PHILOPONUS AND STEPHANUS OF ALEXANDRIA: TWO NEOPLATONIC CHRISTIAN COMMENTATORS ON ARISTOTLE?

*Note:* All references to the Greek commentaries on Aristotle are by page and line of the Berlin Academy edition, (CAG), and to the *de Anima* commentary unless otherwise stated; references to the Latin version of Philoponus' commentary on Book 3 of the *de Anima* are to G. Verbeke's edition, *Jean Philopon. Commentaire sur le de Anima d'Aristote. Traduction de Guillaume de Moerbeke* (Louvain/Paris, 1966).

1. Cf. S. van Riet, "Fragments de l'original grec du 'de Intellectu' de Philopon dans une compilation de Sophonias," *Rev. Philosophique de Louvain* 63 (1965) 5-40.
2. On the relation of our texts to the original courses, cf. M. Richard, "ΑΠΟ ΦΩΝΗΣ," *Byzantion* 20 (1950) 191-199.
3. The authenticity of the commentary usually ascribed to Simplicius has recently been questioned, and its authorship assigned to Priscian, by F. Bossier and C. Steel, "Priscianus Lydus en de 'in de Anima' van Pseudo(?) Simplicius", *Tijdschrift voor Filosofie* 34 (1972) 761-782; their reasons do not seem to me entirely convincing. For another view cf. now I. Hadot, *Le Problème du Néoplatonisme Alexandrin. Hiéroclès et Simplicius* (Paris, 1978), 193-202.
4. Themistius, by contrast, wrote roughly the same on all three books.
5. Cf. A. J. Festugière, "Mode de composition des commentaires de Proclus," *Mus. Helv.* 20 (1963) 81ff. The presence of this arrangement in Book 3 only of Philoponus' commentary was already noted by the CAG editor, M. Hayduck, preface p. v.
6. Cf. 432a 26.
7. Cf. H. Blumenthal, "Neoplatonic interpretations of Aristotle on *Phantasia*," *Rev. of Metaphysics* 31 (1977) 251-252.
8. Simplicius refers to his (lost) commentary on *Metaphysics Lambda* for a discussion of *nous khōristos*, cf. 217, 23-28.
9. Philoponus 2. 13-27.
10. Stephanus 516. 8-15.
11. *Ibid.* 516. 8-517. 32.
12. Cf. above, p. 56, and n. 6.
13. On this cf. H. Blumenthal, "Neoplatonic elements in the *de Anima* commentaries," *Phronesis* 21 (1966) 72-83.
14. Cf. *ibid.*, 84-86, and Philoponus 215. 4ff., 224. 12ff.
15. Philoponus 2. 33ff.
16. Stephanus 518. 8ff.
17. Stephanus 520. 21ff.
18. Philoponus 3. 54-4. 69.
19. Stephanus 518. 8-520. 20.
20. Philoponus 4. 70-75.
21. Stephanus 521. 11ff.
22. He was summoned to the capital to become *oikoumenikos didaskalos* under Heraclius (610-634). cf. H. Usener, *De Stephano Alexandrino* (Bonn, 1880), in *Kleine Schriften* 3 (Leipzig, 1914) 248ff.
23. E.g., Stephanus 527. 29-32; on this cf. above, p. 61.
24. Cf. L. G. Westerink, *Anonymous Prolegomena to Platonic Philosophy* (Amsterdam, 1962) xxiv-xxv.
25. Some of these are, of course, publications by Philoponus of courses given by Ammonius, who was not a Christian.
26. A. Gudeman, "Ioannes Philoponus," *Pauly-Wissowa, Real-Encyclopädie* 9.i (1916) 1769, 1771, followed, e.g., by Schmid-Staehlin, *Geschichte der Griechischen Literatur* 2.ii (Munich, 1924) 1067, and M. Meyerhoff, "Joannes Grammatikos (Philoponus) von Alexandrien und die Arabische Medizin," *Mitteilungen des Deutschen Instituts für ägyptische Altertumskunde in Kairo* 2 (1931) 2-3.
27. *Les derniers commentateurs alexandrins d'Aristote* (Mémoires et Travaux des Facultés Catholiques de Lille) (Lille, 1941) 55-56. Cf., too, H. D. Saffrey, "Le chrétien Jean Philopon et la survivance de l'Ecole d'Alexandrie au VI<sup>e</sup> siècle," *Rev. des études grecques* 67 (1954) 402.
28. "Les convictions religieuses de Jean Philopon et la date de son Commentaire aux 'Météorologiques,'" *Académie R. de Belgique, Bulletin de la Classe des Lett., Sc. Mor. et Pol. sér. 5*. 39 (1953) 299-357.
29. Cf. the article cited in note 13, 73-74.
30. *Commentary on de Anima* 734.
31. On this question cf. E. R. Dodds, *Proclus. The Elements of Theology*<sup>2</sup> (Oxford, 1963) 313-321. Philoponus discusses it in his preface, cf. especially 18. 7-33.
32. For a history of the question, cf. Proclus in *Tim.* I. 276. 10ff. For modern accounts, from opposing points of view, cf. F. M. Cornford, *Plato's Cosmology* (London, 1937) 34ff., and G. Vlastos, "The disorderly Motion in the *Timaeus*" (1939) reprinted with an updating postscript, "Creation in the *Timaeus*: is it a fiction?" (1964), in R. E. Allen (ed.) *Studies in Plato's Metaphysics* (London, 1965) 379-399 and 401-419.
33. Philoponus 229. 31-33.
34. Cf. *Topographia Christiana* 7. 1 (340A), and the notes *ad loc.* in the edition of W. Wolska-Conus, vol. 3, *Sources Chrétiennes* 197 (Paris, 1973) 56. Cf. also *eadem*, *La Topographie Chrétienne de Cosmas Indicopleustes* (Paris, 1962), chap. 5, especially 183ff.
35. Verbeke, in the introduction to his edition of Philoponus, lxx, suggests that a belief in preexistence and reincarnation may not have been regarded as incompatible with Christianity even at this period.
36. The Origenist belief in man's resurrection without a body, as well as preexistence, had been rebutted by Gregory of Nyssa a century and a half before Philoponus; cf. e.g., *de Hom. Opif.* 28. Migne, *Patrologia graeca* (PG) 44. 229B ff., and J. Daniélou "La résurrection du corps chez Grégoire de Nysse," *Vig. Chr.* 7 (1953) 155ff. It should however be noted that Origenism was not yet dead in Philoponus' time; cf. e.g., Justinian's letter to the patriarch Menas, 534 A.D.
37. Cf. *Contra Christianos* fragment 94 Harnack.
38. As opposed to the view that man approaches God by grace, encapsulated in Gregory's *ei gar hoper autos esti tēn physin, toutou tēn oikeiotēta kharizetai tois anthropois* . . . : "if he gives to men by grace assimilation to what he himself is by nature . . ." *de Beat.* 7, PG 44, 128OD.
39. Philoponus 5. 26-32.
40. *Ibid.* 12. 15ff.
41. *Ibid.* 2. 12-14, 18. 16-24.
42. *De Opificio Mundi* 6. 23 = 276. 22-278. 13 Reichardt.
43. Simplicius 86. 17ff.
44. 413a 6-9.
45. Cf. Simplicius 95. 24-33.
46. Philoponus 25. 8.
47. Moerbeke, *op. cit.*, 6. 10-12.
48. Stephanus 527. 27-33.
49. *Op. cit.*, (n. 24) xxiv.
50. For this cf. e.g., Paul the Silentiary, *Hagia Sophia* 126-27.
51. Cf. Lampe, *Patristic Greek Lexicon* s.v. *Pronoia* B. 2. iv., for this use.
52. Stephanus 511. 26, 521. 6.
53. *Ibid.* 547. 12-14.
54. Cf. Westerink, *The Greek Commentaries on Plato's Phaedo* vol. 1. *Olympiodorus* (Amsterdam/Oxford/New York, 1976) 20.
55. Cf. the comments of Proclus, *PT* i.i = I. 6. 16ff. Saffrey-Westerink and Plotinus, *Enn.* 5. 1. 8.10-14.

56. On these conditions cf. A. D. E. Cameron, "The last days of the Academy at Athens," *Proceedings of the Cambridge Philological Society* n.s. 15 (1969), and, on the arrangements made, Saffrey, *op. cit.* (n. 27) 400–401.
57. Cf. Cameron, *ibid.*, 7–8 and H. Blumenthal, "529 and its sequel: what happened to the Academy?" *Byzantion* 48 (1978) 369–385.
58. Cf. the article "Fragments . . ." by S. Van Riet cited in note 1.
59. The eleventh century manuscript Vaticanus 268, is defective for the last two-thirds of Stephanus; Parisinus 1914, from the twelfth century, is the first complete manuscript.
60. I should like to thank those members of the conference whose comments have enabled me to make improvements to this paper.

# NEW OBJECTIVE LINKS BETWEEN THE PSEUDO-DIONYSIUS AND PROCLUS

1. H. D. Saffrey, "Un lien objectif entre le Pseudo-Denys et Proclus," in *Studia Patristica* IX (Texte und Untersuchungen, Bd. 94) (Berlin, 1966), 98–105.
2. *Ibid.*, 104–105.
3. Ammonius Saccas according to E. Elorduy; Damascius according to R. F. Hathaway; Peter the Iberian according to E. Honigmann; Peter the Fuller according to U. Riedinger. The various studies relative to these identifications were surveyed and reviewed by J. M. Hornus, "Les recherches récentes sur le pseudo-Denys l'Aréopagite," in *Revue d'Histoire et de Philosophie religieuses* 35 (1955), 404–448 and 41 (1961) 22–27. See also the very suggestive table in R. F. Hathaway, *Hierarchy and the Definition of Order in the Letters of Pseudo-Dionysius* (The Hague, 1969), 31–35.
4. H. Urs von Balthasar, "Das Scholienwerk des Johannes von Scythopolis," in *Scholastik* 15 (1940), 16–38, reproduced with corrections in appendix to *Kosmische Liturgie*, 2nd. ed. (Einsiedeln, 1962), 644–672, under the title: "Das Problem der Dionysius-Scholien."
5. At the present time one is obliged to read these scholia in the edition of Cordier (Paris, 1634), reproduced in Migne, *Patrologia Graeca* (PG), tome 4 (Paris, 1857).
6. PG 4, col. 264B–C. Cf. H. Ch. Puech, "Libératus de Carthage et la date de l'apparition des écrits dionysiens," in *Annuaire de l'École pratique des Hautes Études*, Section des Sciences religieuses, 1930–1931 (Melun, 1930), 3–39; and R. F. Hathaway, *op. cit.*, 11–12.
7. PG 4, col. 368D–369A.
8. Proclus, *Theol. plat.* I 29, 124, 12–125, 2 Saffrey-Westerink.

## THE PROBLEM OF GENERAL CONCEPTS IN NEOPLATONISM AND BYZANTINE THOUGHT

1. See n. 3.
2. Ed. L. Benakis, *Philosophia* (Athens) 3 (1973), 361–379.
3. See L. Benakis, "The Study of Byzantine Philosophy: Critical Survey 1949–1971," (in Greek) *Philosophia* (Athens) 1 (1971), 390–433. H. Hunger, *Die hochsprachliche profane Literatur der Byzantiner* I (A. Philosophie) (München, 1978), 3–62.
4. My main source is K. Kremer's important contribution to the problem: "Die Anschauung der Ammonius (Hermeiou)-Schule über den Wirklichkeitscharakter des Intelligiblen," *Philosophisches Jahrbuch* 19 (1961–1962), 46–63. This article has not so far been given the attention it deserves.
5. It must be noted that the term "Platonism" is used here and subsequently in accordance with its established usage in many of today's logicians and specialists in the theory of knowledge, such as Quine, Goodman, Stegmüller, and others. That is, it is not an exact characterization of Platonic teaching, but is a recognition that today also it is a question of scientific significance whether or not abstract objects exist besides the concrete in the natural world. It is also generally accepted that if we remove the metaphysical and mythical appendages that have surrounded the Platonic theory of the Forms and which today have historical rather than theoretical interest, the Platonic "discovery" of ideal beings emerges even more as the great contribution of Plato to philosophy. Kant's important view on this point is not very well known: see *The Critique of Pure Reason* B, 370–371.
6. From a contemporary perspective on the problem of general concepts and given the content that the terms "Platonism" and "nominalism" assume today, there does not seem to be any room for theoretical support for this traditional conceptualism (conceptual realism), and particularly for psychological conceptualism (formation of general concepts by abstraction from experience, e.g., Locke: "to frame abstract ideas"). The latter, starting from the failure of the nominalistic interpretation of language, also ends up as a form of nominalism—this time at least without internal contradictions.  
That which certainly appears of great interest today in the theory of knowledge is so-called constructive conceptualism or constructionism, which reliable scholars consider to be an "unorthodox Platonism" to the extent that it involves an ontological questioning of the existence of ideal constructions. Perhaps in fact it is a variation of it, but free of contradictions which it avoids by its renunciation of "nonpredicative conceptual constructions" (nonpredicative concepts and definitions) and of "unpredicative conceptual constructions." We have in mind several such systems in the area of mathematics and mathematical logic of which the most known are those of Quine, Hao Wang, Kleene, Church, Turing, and other more recent systems. On the whole subject of the *universalia* problem, see now *Das Universalien-Problem*, ed. W. Stegmüller (Darmstadt: Wissenschaftliche Buchgesellschaft [Weg der Forschung 83] 1978); papers by B. Russell, F. P. Ramsey, P. Bernays, O. Quine, A. Church, N. Goodman, L. Henkin, Hao Wang, N. Chomsky, A. Ross Anderson, R. Carnap, and others.
7. Porphyry *Isagoge*, ed. A. Busse, *Commentaria in Aristotelem Graeca* (CAG) vol. IV, 1, p. 1, 9–13.
8. Ammonius *In Porph. Isagogen*, ed. A. Busse, CAG IV, 3, p. 87, 19–20.
9. It is clear that we have here a mixing of two different problems without, curiously, the substance of the matter being altered.

10. Ammonius *In Porph. Isagogen* 39–42 and 104–105; Philoponus *In Categorias*, CAG XIII, 9 and 167.
11. With this transfer of the Forms to the mind of the God-Creator, the primary significance of the Form as creative cause of the sensible weakens, of course, but the Form does not cease to have its defining role in relation to sensible particulars. The difference is that it becomes an intermediate cause between the God-creator and the creature.

In Christian writers and in Byzantium, the exemplary character of the Forms ("exemplarism") is utterly rejected: God has no need of models, especially those existing before him. The Forms will be reduced still further to simple thoughts of the demiurge (Psellos: "thoughts of the Creator," "the first concepts of the creative Mind"; Symeon Seth: "existing kinds in the creative Mind," etc.) and their self-existence is rejected even more categorically (τὸ αὐθὺπαρκτον, τὸ ἀπὸλύτον, τὸ ἐνυπόστατον, τὸ μένειν καθ' ἑαυτάς). In the most positive formulation they give, the Forms are the creative causes of the sensible, disseminated by the Creator in the natural world as instruments of his power.

13. P. Joannou, "Eustrate de Nicée. Trois pièces inédites de son procès (1117)," *Revue des Études Byzantines* 10 (1952), 34.
14. See L. Benakis, "The Problem of General Concepts and the Conceptual Realism of the Byzantines" (in Greek) *Philosophia* (Athens) 8–9 (1978–1979), 311–340 (especially 327–336).

## THE PRIMACY OF EXISTENCE IN THE THOUGHT OF ERIUGENA

1. In this connection, one should consult, among others, the important studies of P. Hadot, *Porphyre et Victorinus* (Paris, 1968), vols. I and II, particularly pages 270ff., 280ff., 488ff.; also S. Gersh, *From Iamblichus to Eriugena* (Leiden, 1978).
2. That is, the word "creator" (Eriugena, *Expositiones* (Exp.) XIII, 607). The other terms, *creare*, *creaturae*, *ex nihilo*, are absent from the text of Dionysius.
3. R. Roques has already illustrated this working method of Eriugena with the aid of other examples; see *Libres sentiers vers l'érigénisme* (Rome, 1975), pp. 99–130. E. Jeuneau likewise dealt with this question in a lecture entitled "Les traductions de Jean Scot" at Dumbarton Oaks, Washington, D.C. (May 1977).
4. See R. Roques, *L'univers dionysien* (Paris, 1954), p. 41.
5. *Ibid.*, p. 79ff.
6. E. Gilson, in his book *L'Etre et l'essence* (Paris, 1948), has clearly shown that the question of origin raises that of existence, particularly on page 93 and the following pages.
7. Migne, *Patrologia graeca* (PG) III, 817, 816; see also *Celestial Hierarchy* ("Sources chrétiennes" series), IV, 1; XIII, 4.
8. PG 816; *Celestial Hierarchy* XIII, 4.
9. M. de Gandillac, in his translation of the *Celestial Hierarchy* (above note 7), has in my opinion interpreted this passage very well (p. 93).
10. *De divisione naturae* (DDN); Migne, *Patrologia latina* CXXII, 682; Exp. XIII, 405.
11. Column (Col.) 643.

13. Exp. XIII, 607.
14. DDN 553.
15. DDN 453–454.
16. DDN 443, 644; Exp. IV, 133.
17. I accept the excellent translation of M. de Gandillac, *op. cit.*, p. 94, who writes: "La divinité sur-essentielle (i.e., au delà de l'être) est l'être de toute chose."
18. Exp. IV, 132. Eriugena here suspects the scribe of having written ZΩA instead of ONTA; it matters little as these terms would be synonymous, if not for all the Greeks at least for Dionysius. It was a fine opportunity for him to translate ONTA by *entia* or *essentiae*. Why then *existentiae*?
19. DDN 462.

20. DDN 490, 776. See the analysis by B. Stock in *Actes du Colloque de Laon*, éd. CNRS (Paris, 1977), p. 327.
21. DDN 487.
22. *De Praedestinatione*, Migne, *Patrologia latina* CXXII, 390.
23. *Exp.* VIII, 76.
24. DDN 455.
25. DDN 759. That is to say that the term "entia" is known; there is already an attestation for it in the *Inst. Orat.* of Quintilian, VIII, 3<sup>rd</sup>.
26. *Exp.* IV, 132.
27. See the commentary by M. de Gandillac, *Actes du Colloque de Laon*, éd. CNRS (Paris, 1977), p. 398.
28. A metaphor analysed by E. Jeuneau, *Quatre thèmes érigéniens* (Montréal, 1978), p. 36ff.
29. DDN 470, 471, 472.

### THE OVERCOMING OF THE NEOPLATONIC TRIAD OF BEING, LIFE, AND INTELLECT BY SAINT THOMAS AQUINAS

1. The Proclean authenticity of the *Elements of Theology*, which some had placed in doubt (namely, Bardenhewer and Geyer), is by now beyond discussion. On this point, see E. R. Dodds, *Proclus: The Elements of Theology* (Oxford, 1933), p. xiv, n. 3. Another problem is that of the dating of this work within the total literary output of Proclus. Its affinity with *The Platonic Theology* leaps to the eye of any reader, even in the edition of the entire text published by Portus (Hamburg, 1618). Instead of being a youthful work, as is commonly believed, could not the *Elements of Theology* perhaps derive from *The Platonic Theology* as a sort of compendium?

I shall on occasion refer to William of Moerbeke's translation of the *Elements of Theology* in the edition of C. Vansteenkiste, "Procli Elementatio Theologica translata a Guilelmo de Moerbeke," *Tijdschrift voor Filosofie*, 13 (1951), pp. 263-302 and 491-531.

2. Dodds, p. xxv. On "absolute realism," see my *Tomismo e pensiero moderno* (Rome, 1969), pp. 440-441.
3. Saint Thomas Aquinas, *Super librum de causis expositio*, ed. H. D. Saffrey, *Textus Philosophici Friburgenses*, 4 / 5 (Fribourg and Louvain, 1954), lect. XVI, p. 94, lines 13-19; Pera, n. 318, p. 97a (since the edition of C. Pera [Turin, 1955] usually has a more accurate text, we shall follow it here):

Secundum autem Platonicas positiones, omne quod in pluribus invenitur oportet reducere ad aliquod primum quod per suam essentiam est tale, a quo alia per participationem talia dicuntur. Unde secundum eos virtutes infinitae reducuntur ad aliquod primum quod est essentialiter infinitas virtutis; non quod sit virtus participata in aliqua re subsistente, sed quia est subsistens per seipsam.

4. See *De causis*, prop. II, in Otto Bardenhewer, *Die pseudo-aristotelische Schrift 'Ueber das reine Gute' bekannt unter dem Namen 'Liber de causis'* (Freiburg, 1882), p. 165. See also lect. II in Saint Thomas' commentary (Saffrey, p. 11).
  5. Saint Thomas, *Super librum de causis expositio*, lect. XVI, Saffrey, p. 94, 11. 16-29.
  6. Proclus, *Elements of Theology*, prop. 138, ed. Vansteenkiste, p. 505. For the Greek text, see Dodds, p. 122.
  7. See Proclus, *Elements of Theology*, prop. 138, ed. Vansteenkiste, p. 505. The original Greek reads: πάντων, μετεχόντων τῆς θείας ιδιότητος καὶ ἐκθεομένων πρωτιστόν ἐστι καὶ ἀρχότατον τὸ ὄν (ed. Dodds, p. 122).
  8. See Saint Thomas, *Super librum de causis expositio*, lect. IV, Saffrey, p. 29, 11. 8-16; Pera, n. 102, p. 28b.
  9. *De causis*, prop. IV, ed. Bardenhewer, p. 166, 11. 19-25.
  10. "De hoc igitur esse in intelligentiis participato, rationem assignat quare sit maxime unitum: dicit enim quod hoc contingit propter propinquitatem suam primae causae, quae est esse purum subsistens, et est vere unum non participatum, in quo non potest aliqua multitudo inveniri differentium secundum essentiam: quod autem est propinquius ei quod est per se unum, est magis unitum quasi participans unitatem. Unde intelligentia, quae est propinquissima causae primae, habet esse maxime unitum" (Saint Thomas, *Super librum de causis expositio*, lect. IV, Saffrey, p. 29, 11. 16-24).
  11. It is not easy to decipher a text as difficult as that of the *De causis* in regard to what it preserves and what it lets drop of the complicated Proclean derivations. The key, it seems to me, is indicated in prop. II, which simplifies the triadic process by dividing *esse superius*, which is the sphere of the divine (τὸ Θεῖον) into *ante aeternitatem*, *cum aeternitate*, and *post aeternitatem et supra tempus*, which are respectively the First Cause, Intelligence, and Soul. The three propositions of Proclus to which Saint Thomas refers do not speak of the First Cause at all but treat of the sphere of the real as such, namely τὸ ὄντως ὄν. The Angelic Doctor himself understands the "... enter ens per oppositum ad mobiliter ens, sicut esse stans dicitur per oppositum ad moveri" and such is then the *esse superius* (lect. 2, Saffrey, p. 13, 11. 9-11). In the commentary on prop. 86, in which τὸ ὄντως ὄν appears for the first time in the technical sense, Dodds (p. 245) denotes it by *the One* while he translates (and does so better) *in loco by the true Being* (p. 79). The fact then that Proclus qualifies τὸ ὄντως ὄν as ἀπειρον ... κατὰ δύναμιν μόνῃν does not at all demonstrate that it is the One, not only because πέρας and ἀπειρον are proper determinations of the sphere of οὐσία, but also because Proclus himself affirms the existence of a πρῶτον πέρας and of a πρῶτη ἀπειρία (prop. 90) as principles of every composite. It is not a matter here of a simple nuance. The Platonic One and Good is ἐπέχειν τῆς οὐσίας while τὸ ὄντως ὄν of Proclus, on the other hand, is composed of the finite and the infinite (prop. 89) and is said to be placed the "closest" and "most like" to the One, and therefore cannot itself be the One.
- It is Saint Thomas' merit to have given a metaphysical content to the *Sum, qui sum* of Exodus (3:14) by means of the concept of intensive *esse*. Neoplatonism certainly noticed the break between the One, the Forms or Ideas (the "participations"), and the concrete things (the things which participate), but it did not succeed in bridging this gap. The One always remains isolated because there is lacking free creation.
12. Cf. Emile Bréhier, *La philosophie de Plotin* (Paris, 1928), p. 38; idem, *The Philosophy of Plotinus*, trans. Joseph Thomas (Chicago, 1958), p. 46.
  13. *The Platonic Theology* III, c. 7; ed. Portus, p. 135. Proclus explains the relations of appendage by way of a circle (III, 9, p. 135). Further on the dependence of the three hypostases on the first divinity is expressly affirmed (IV, c. 3, p. 185). This triad is then in its turn the source and cause of everything which comes after it (III, c. 21, p. 172). It should be noted that in all these complex schemes of metaphysical phylogenesis, of which *The Platonic Theology* is so extraordinarily rich, the fundamental triad is always stated in this order: οὐσία, ζῳή, νοῦς, and this is also to be noted in the *Elements of Theology*. On the probable origin of this latter doctrine, which sets forth life as the dynamic bond between οὐσία and νοῦς, see the commentary of Dodds, p. 252ff. and C. Fabro, *Partecipazione e causalità* (Turin, 1960), p. 412ff.
  14. According to the Platonic conception of "vertical falling," as it has been called.

15. Saint Thomas, *Super librum de causis expositio*, lect. III, Saffrey, p. 18, 11. 14–23; Pera, n. 66, p. 20a:

Inter has tamen formas hunc ordinem ponebat: quod quanto aliqua forma est universalior, tanto est magis simplex et prior causa: participatur enim a posterioribus formis. Sicut si ponamus animal participari ab homine et vita ab animali, et sic de aliis. Ultimum autem quod ab omnibus participatur, et ipsum nihil aliud participat, est ipsum Unum et Bonum separatim quod dicebat summum Deum et primam omnium causam. Unde et in libro Procli inducitur propositio CXVI talis: *Omnis Deus participabilis est, . . . excepto uno.*

The passage cited from Proclus is: πᾶς Θεὸς μεθεκτός ἐστι, πλὴν τοῦ ἑνός (ed. Dodds, p. 102; ed. Vansteenkiste, p. 497). On Proclus' oscillation regarding this principle, see Dodds' commentary, p. 262.

16. *Ibid.*, p. 18, 1. 23 to p. 19, 1. 9; Pera, n. 67, p. 20a.  
 17. *Ibid.*, p. 19, 11. 21–28; Pera, n. 70, p. 20b. Saint Thomas here quotes Proclus, *Elements*, prop. 129 (ed. Dodds, p. 114, 1. 11).  
 18. *Ibid.*, p. 19, 1. 28 to p. 20, 1. 4; Pera, n. 68–71, p. 20ab.  
 19. *Ibid.*, p. 21, 11. 9–24; Pera, n. 78, p. 21b.  
 20. *Ibid.*, p. 22, 1. 13 to p. 23, 1. 20.  
 21. *De causis*, prop. XVII, ed. Bardenhewer, p. 179, 1. 23 and p. 180, 11. 2–5.  
 22. Saint Thomas, *Super librum de causis expositio*, lect. XVIII, Saffrey, p. 104, 11. 1–9; Pera, n. 345, pp. 103b–104a.  
 23. *Ibid.*, p. 104, 11. 9–14; Pera, n. 345–347, pp. 103b–104b:

Quia ergo intelligere praesupponit vivere, et vivere praesupponit esse, esse autem non praesupponit aliquid aliud, inde est quod primum ens dat esse omnibus per modum creationis. Prima autem vita, quacunque sit illa, non dat vivere per modum creationis sed per modum formae scilicet informationis. Et similiter dicendum est de intelligentia.

24. *Ibid.*, p. 104, 11. 14–16; Pera, n. 348, p. 104b:

Ex quo patet quod cum supra dixit intelligentiam esse causam animae, non intellexit quod esset eius causa per modum creationis, sed solum per modum informationis.

25. *Ibid.*, lect. V, Saffrey, p. 38, 11. 1–9; Pera, n. 139, p. 36b. See *De causis*, prop. IV; ed. Bardenhewer, p. 167, 1. 24 to p. 168, 1. 2.  
 26. *Ibid.*, p. 38, 11. 9–20. Modern historiography, especially under the influence of the studies of Werner Jaeger, accepts the “continuity of development” among Plato, Aristotle, and Neoplatonism. See Philip Merlan, *From Platonism to Neoplatonism* (The Hague, 1953), p. 169. Merlan remarks at the conclusion of his book: “It is perfectly legitimate to speak of an *Aristoteles Neoplatonicus*” (p. 195). Whatever be the case regarding the historic Aristotle, this statement can also hold for the Thomistic Aristotle.  
 27. It is instructive to compare this chapter with the *De spiritualibus creaturis*, a. 5, which has the identical scheme for the same argument, but which completely lacks the Neoplatonic theory of the intermediaries. That theory constitutes the principal part of the *De substantiis separatis*. The other sporadic allusions to the Platonists in the *De spiritualibus creaturis* are also somewhat vague. See a. 8, ad 10 and a. 9, ad 2.  
 28. Saint Thomas, *De substantiis separatis*, c. 1, n. 4; ed. Perrier, p. 125:

Una quidem secundum quod apprehendit numeros mathematicos et magnitudines et figuras mathematicas sine materiae sensibilis intellectu. . . . Alia vero abstractione utitur intellectus noster intelligendo aliquod universale absque consideratione alicuius particularis

29. *Ibid.*, c. 1, n. 5; ed. Perrier, p. 126 (trans. Lescoe, modified):

In ipsis etiam speciebus ordinem quemdam ponebat: quia secundum quod aliquid simplicius in intellectu, secundum hoc prius erat in ordine rerum. Id autem quod primo est in intellectu, est unum et bonum: nihil enim intelligit qui non intelligit unum et bonum. Unum autem et

bonum consequuntur se: unde ipsam primam ideam unius, quod nominabat secundum se unum et secundum se bonum, primum rerum principium esse ponebat, et hunc summum Deum esse dicebat.

Perrier accepts the reading “summum bonum” instead of the other reading of “summum Deum,” which I think should be preferred. In fact, the latter appears in the same context further on, namely in c. 16, and also in the commentary on the *De coelo et mundo*, II, lect. 4, cited below in note 36.

30. Further on in c. 16 (n. 94; ed. Perrier, p. 185), Saint Thomas praises Dionysius on this subject for his notion of intensive *esse*: “In quo removet opinionem Platonicorum, qui ponebant quod ipsa essentia bonitatis erat *summus Deus*, sub quo erat alius Deus qui est ipsum esse, et sic de aliis.”  
 31. In the *Super librum de causis expositio*, lect. III, Saffrey, p. 19, 1. 2, and lect. XVIII, Saffrey, p. 103, 1. 18, mention is made of an *intellectus idealis*. This position is quickly corrected by Saint Thomas with Dionysius.  
 32. Saint Thomas, *De substantiis separatis*, c. 1, nn. 5–6:

Sub hoc autem uno diversos ordines participantium et participatorum instituebat in substantiis a materia separatis: quod quidem omnes ordines secundos deos esse dicebat, quasi quasdam unitates secundas post primam simplicem unitatem.

Rursus, quia omnes aliae species participant uno, ita etiam oportet quod intellectus ad hoc quod intelligat, participet eorum speciebus. Ideo sicut sub summo Deo, qui est unitas simplex et imparticipata, sunt aliae species quasi unitates secundae et dii secundi, ita sub ordine harum specierum et unitatum ponebat ordinem intellectuum separatorum, quia participant supradictas species ad hoc quod sint intelligentes in actu: inter quos tanto unusquisque est superior, quanto propinquior est primo intellectui, qui plenam habet participationem specierum, sicut in diis seu unitatibus tanto unusquisque est superior, quanto perfectius participat unitatem primam.

Separando autem intellectum a diis, non excluderat quin dii essent intelligentes; sed volebat quod superintellectualiter intelligerent, non quidem quasi participantes aliquas species, sed per se ipsos: ita tamen quod nullus eorum esset bonus et unus nisi per participationem primi et unius boni.

33. *Ibid.*, c. 1, n. 6; ed. Perrier, p. 126:

Rursus, quia animas quasdam intelligentes videmus, non autem hoc convenit animae ex eo quod est anima (alioquin sequeretur quod omnis anima esset intelligens, et quod anima secundum totum id quod est esset intelligens), ponebat ulterius, quod sub ordine intellectuum separatorum esset ordo animarum, quarum quaedam, superiores videlicet, participant intellectuali virtute; infirmas vero ab hac virtute deficient.

Rursus, quia corpora videntur non per se moveri . . . ponebat corporibus accidere in quantum participabant animam: nam illa corpora quae ab animae participatione deficient, non moventur nisi ab alio. Unde ponebat animabus proprium esse quod se ipsas moverent secundum se ipsas.

34. *Ibid.*, c. 1, n. 7; ed. Perrier, p. 127.

35. *Ibid.*, c. 9, n. 60:

His autem rationibus moti Platonici posuerunt quidem omnium immaterialium substantiarum et universaliter omnium existentium Deum esse immediate causam essendi secundum praedictum productionis modum, qui est absque mutatione vel motu; posuerunt tamen secundum alias participationes bonitatis divinae ordinem quendam causalitatis in praedictis substantiis.

As we have seen, this affirmation, which is of major import in Thomism, goes beyond the Neoplatonic dialectic. It also constitutes the innovation in Thomas' turning things upside down in his comparison of Plato and Aristotle.

36. Saint Thomas, *De substantiis separatis*, c. 9, n. 61; ed. Perrier, p. 162ff. The following synthetic

exposition in a commentary on Aristotle which is contemporaneous with the *De substantiis separatis* should be noted:

Considerandum est quod Platonici ponebant unum *Deum summum*, qui est ipsa essentia bonitatis et unitatis, sub quo ponebant ordinem superiorum *intellectuum* separatorum, qui apud nos consueverunt intelligentiae vocari; sub hoc ordine ponebant ordinem *animarum*, sub quo ordine ponebant ordinem corporum. Dicebant ergo quod inter intellectus separatos superiores, primi dicuntur *intellectus divini*, propter similitudinem et propinquitatem ad Deum; alii vero non sunt divini, propter distantiam ad Deum; sicut etiam animarum supremae sunt intellectivae, infimae autem non intellectivae sed irrationales. *Corpora* etiam suprema et nobiliora dicebant esse *animata*, alia vero inanimata. Rursus dicebant quod *supremae animae* propter hoc quod dependent ex intelligentiis divinis, sunt *animae divinae*; et iterum corpora suprema propter hoc quod sunt coniuncta animabus divinis, sunt corpora divina (Saint Thomas, *In librum II De coelo et mundo expositio*, lect. 4, *Opera omnia*, XIX [Parma, 1866], p. 87b).

It is satisfying to note that in his mature commentaries Saint Thomas frequently sees Aristotle in agreement with Plato on this point.

37. Saint Thomas, *De substantiis separatis*, c. 17, n. 111; ed. Perrier, p. 198. Cf. Proclus, *Elements of Theology*, prop. 196, ed. Vansteenkiste, p. 525; Dodds, pp. 170 and 300. The meaning of this proposition from Proclus is that only the unparticipated Soul is wholly lacking in corporeity, since every other soul has a relationship with the "first body" (πρῶτον σῶμα) and the "first vehicle" (πρῶτον ὄχημα). See again Dodds, p. 313ff.: "The Astral Body in Neoplatonism."
38. Saint Thomas points out the agreement of the two schools on this point. See *Super librum de causis expositio*, lect. II, Saffrey, p. 12; lect. XI, Saffrey, pp. 73–75, with appropriate discussion; lect. XXX, Saffrey, p. 137, for the eternal motion of the heavens.
39. According to Saint Thomas, the *De causis* is divided into the following general sections: prop. I, general theorem; prop. II–XV, the distinction of the causes; prop. XVI–XXXII, the coordination or dependence or comparison of the causes to one another. On the structure of the *Elements*, see Dodds, pp. 187, 193, 200–201, 212, 223, 227, 230, 236, 240, 246, 250, 257, 284, and 294.
40. The superiority of the *Parmenides* over the other dialogues of Plato, which even involves the reduction of the latter to the former, is the point of departure for the dialectical method of Proclus. One aspect of that dialogue's superiority is its reference to Parmenides himself. See *The Platonic Theology*, I, c. 9; ed. Portus, p. 17ff. See also c. 10, p. 23, and earlier c. 7, p. 16. In c. 10, p. 21, Proclus cites his commentary on the *Parmenides*.
41. *De causis*, prop. I, ed. Bardenhewer, p. 163, l. 3.
42. We observe something similar a century earlier in Nicholas of Methone or Messene, who often appeals to Dionysius. See his *Institutionis Theologiae Procli Refutatio*, ed. J. Th. Voemel (Frankfurt, 1825), pp. 6, 9, 17, 25, and 31. In the commentary on prop. LXXVI, p. 102ff., Dionysius is cited for having placed the "Ideas" of things in God.
43. In like fashion, there are many secondary universal causes. However, Saint Thomas still leaves out the "universalis" and it is not by chance that he does so.
44. Saint Thomas, *Super librum de causis expositio*, lect. I, Saffrey, pp. 5–6; Pera, n. 21, p. 6a.
45. *Ibid.*, lect. I, Saffrey, p. 7, 11, 11–16; Pera, n. 24, p. 6a;

Ergo hoc ipsum quod causa secunda sit causa effectus, habet a prima causa: esse ergo causam effectus inest primo primae causae, secundo autem causae secundae. Quod autem est prius in omnibus, est magis, quod perfectiora sunt priora naturaliter: ergo prima causa est magis causa effectus quam causa secunda.

46. *De causis*, prop. I, ed. Bardenhewer, p. 164, 11. 3–6 and 12–16:

nam ergo manifestum est et planum quod causa prima longinqua est plus comprehendens et vehementius causa rei quam causa propinqua, et propter hoc fit eius operatio vehementioris adhaerentiae cum re quam operatio causae propinquae . . . , et quando removetur causa secunda a causato suo non removetur causa prima, quoniam causa prima est maioris et vehementioris adhaerentiae cum re quam causa propinqua et non figitur causatum causae secundae nisi per virtutem causae primae.

For "vehementius" the German version of Bardenhewer has "in hoheren Grade" (p. 59), which is certainly weaker. Proclus has μετρίωνος (prop. 56: p. 54, lines 5 and 16), which Dodds (p. 55) translates as "in greater measure." The Latin version is far more effective.

47. Saint Thomas, *Super librum de causis expositio*, lect. I, Saffrey, p. 8, 11, 21–26; Pera, n. 34, p. 6b:

Manifestum est enim quod quanto aliqua causa efficiens est prior, tanto eius virtus ad plura se extendit; unde oportet quod proprius eius effectus communior sit; causae vero secundae proprius effectus in paucioribus invenitur, unde et particularior est. Ipsa enim causa prima producit vel movet causam secundam agentem et sic fit ei causa ut agat.

48. Proclus, *Elements of Theology*, prop. 56, ed. Vansteenkiste, p. 286:

Omne quod a secundis producit et a prioribus et causalioribus producit eminentius . . . . Si enim secundum totam habet substantiam ab eo quod ante ipsum, et potentia sibi producendi inde est. Et enim potentiae productivae secundum substantiam sunt in producentibus et complement ipsorum substantiam. Si autem potentiam producendi a superiori causa sortita sunt, ab illa habent quod sint causa quorum sunt causa, mensurata inde secundum hypostaticam potentiam.

Identical terminology is to be found in the following proposition, namely, prop. 57. There "producere" is used to translate the Greek παράγειν which on other occasions is expressed by "derivare" (cf. Dodds, p. 54). We can observe that the problem of "producere" is discussed much earlier in the *Elements*. Following after the prologue, which contains the general doctrine of participation, the term appears explicitly in prop. 7: "Omne productivum alterius melius est quam natura eius quod producit" (ed. Vansteenkiste, p. 267). Cf. especially prop. 25–30, which prepare for the doctrine of ἐπιστορεσις.

49. Saint Thomas, *Super librum de causis expositio*, lect. I, Saffrey, p. 8, line 8 to p. 9, line 1:

Inveniuntur igitur praedicta tria quae tacta sunt [causa prima plus influit . . . tardius recedit, prius adventit] primordialiter quidem in causis efficientibus et ex hoc manifestum est quod derivatur ad causas formales: unde et hic ponitur verbum *influenti*, et Proclus utitur verbo *productionis* quae exprimit causalitatem causae efficientis.

50. *Ibid.*, lect. I, Saffrey, p. 9, 11, 14–19; Pera, n. 38, p. 7a:

Comparatur autem prima omnium causa ad totam naturam sicut natura ad artem. Unde id quod primo subsistit in tota natura est a prima omnium causa quod appropriatur singulis rebus officio secundarum causarum.

Since Proclus expressly holds to this doctrine in the *Elements of Theology*, prop. 72 (ed. Vansteenkiste, p. 292), it is strange that Saint Thomas does not appeal to it here. However, the principle is present in an implicit form in prop. 57, which was cited by Saint Thomas. This extension of the causality of the One to prime matter is a post-Platonic development which is already found expressly in Syrianus (cf. Dodds, p. 231).

In *The Platonic Theology*, the creation or production of matter is the work of some one of the gods situated above the demiurge, while the demiurge of the whole places order and arrangement in the complex. The term used most frequently to indicate creation is ἀπογενεῖν and it seems to be a question of total production, though not from nothing in the biblical sense. In fact, Proclus uses the term παρόσσειν (see especially V, c. 17; ed. Portus, p. 281) both for the origin of matter and also for bodies.

51. Saint Thomas, *Super librum de causis expositio*, lect. I, Saffrey, p. 9, 11, 19–25; Pera, n. 39, p. 7a:

Nam propter ultimum finem, qui est universalis, alii fines appetuntur, quorum appetitus advenit post appetitum ultimi finis, et ante ipsum cessat. Sed et huius ordinis ratio ad genus causae efficientis reducit: nam finis in tantum est causa in quantum movet efficientem ad agendum, et sic prout habet rationem moventis pertinet quodammodo ad causae efficientis genus.

# THE PROBLEM OF THE REALITY AND MULTIPLICITY OF DIVINE IDEAS IN CHRISTIAN NEOPLATONISM

1. Cf. Plato's famous description of the ideas as "the really real" (*to onto on*) in *Phaedo* 65-66 and other classic discussions of the ideas.
2. Cf. *Parmenides* 132b-c (trans. Cornford):  
 "But Parmenides, said Socrates, may it not be that each of these forms is a thought, which cannot properly exist anywhere but in a mind? In that way each of them can be one and the statements that have just been made would no longer be true of it.  
 Then, is each form one of these thoughts and yet a thought of nothing?  
 No, that is impossible.  
 So it is a thought of something?  
 Yes.  
 Of something that is, or of something that is not?  
 Of something that is."
3. Cf. *Enneads* VI, 7, 15-16 (trans. MacKenna-Page), and occasionally through V, 1-2. In these passages the Ideas are spoken of as the product of the Intellectual-Principle.
4. *Enneads* V, 9, 7-8. Cf. also V, 3, VI, 6, 7-8, and off and on throughout V, 1-2. The essence of the position is that *Nous* and its objects constitute a single interdependent relational unity, neither properly prior to the other, but constituted together as a unitary life *simultaneously* by the overflow of the Good. But see VI, 6, 8 for a priority of being over *Nous*: "First, then, we take Being as first in order: then the Intellectual Principle. . . . Intellectual Principle as the Act of Real Being, is a second." The Greek texts here are entirely clear, the terms used being *pro*, *proteron*, etc.
5. This doctrine is clear, explicit, and constant throughout the *Enneads*. Cf. V, 1, 4; V, 6; V, 3, 10-15; V, 6; V, 9, 6; VI, 6, 9; VI, 7, 13 and 17. The intellectual realm is always a one-many, both because Being as object is distinct from the act that knows it and because each Being-Idea is distinct from every other, though not divided from it.
6. Anton Pegis has admirably summed up the dilemma posed to Christian thought by the Platonic world of ideas: "St. Augustine . . . thought to baptize the Platonic Forms and to make them ideas in the mind of God. But this was easier to assert than to accomplish philosophically. For the perplexing mystery of the Platonic Forms is that in a Christian world they can be neither God nor creatures. They cannot be creatures because they are immutable and eternal; and they cannot be God because they are a real plurality of distinct and distinctly determined essences. Yet they rose before the minds of Christian thinkers again and again, and they hovered somewhere on the horizon between God and creatures, strange aliens both from heaven and from earth, and yet aliens whose message proved so enduringly dear to Christian thinkers that, rather than forget it, they exhausted their energies in pursuing it." "The Dilemma of Being and Unity," in R. Brennan, *Essays in Thomism* (New York: Sheed and Ward, 1942), pp. 158-159. The whole article, in fact, is a brilliant example of a truly philosophical study in depth of the history of philosophy.
7. Cf. for example his famous brief treatise on the ideas, *De Diversis Quaestionibus LXXXIII*, Qu. 46 (Migne, *Pat. Lat.*, XL, 29-31), and other standard references.
8. Cf. F. J. Thonnard, "Ontologie augustinienne," *L'Année théologique augustinienne* 14 (1954), 39-52, esp. pp. 42-43. Clear texts are in Augustine *De Trin.* V, 2, 3: "Ab eo quod est esse dicta est essentia," and *De Immortalitate Animae* XII, 19: "Omnis enim essentia non ob aliud essentia est, nisi quia est."
9. *De Trinitate* V, 2, 3.
10. *Sermo* VII, n. 7.
11. *De Moribus Manichaeorum* VII, 7.
12. *Contra Manichaeos*, c. 19 (*PL*, XLII, 557). On the above texts see V. Bourke, *St. Augustine's View of Reality* (University of Villanova Press, 1965), and J. Anderson, *St. Augustine and Being* (The Hague: Nijhoff, 1966).
13. It has been called to my attention, however, by the Augustinian scholar, Robert J. O'Connell, that

- Augustine, in *Confessions* X, c. 9-12, when speaking about memory, distinguished between the *sensible images* of past contingent events, such as going to the Tiber river, and the *intellectual intuition* of numbers and their relations, which intuition puts us in contact with the *very things themselves* (*res ipsae*), with the very reality of numbers, which *truly are* (*valde sunt*), hence buried deep in our intellectual memory, which is always in contact with the immutable and eternal truths of the intelligible world through divine illumination. Now since, as *rationes aeternae*, numbers are certainly on a par with all the other *rationes aeternae*, it would seem necessary to conclude by analogy that all the *rationes aeternae* are also *res ipsae, et valde sunt* (c. 12). Yet Augustine never quite seems to go this far or work out the implications.
14. On John Scottus Eriugena's doctrine, see M. Cappuyns, *Jean Scot Erigène* (Paris: Desclée, 1933); H. Bett, *Johannes Scotus Eriugena* (New York: Russell & Russell, 1964); J. Trouillard, "Erigène et la théophanie créatrice," in J. O'Meara and L. Bieler, eds., *The Mind of Eriugena* (Dublin: Irish Univ. Press, 1973), 98-113; T. Gregory, *Giovanni Scoto Eriugena* (Florence: Felice Le Monnier, 1963), ch. I: "Dall' Uno al Moheplice"; and the standard histories of Gilson, etc.
  15. Cf. *De Divisione Naturae* II, c. 36 (1. ed. Sheldon-Williams, *Johannis Scotti Eriugena Periphyseon*, Dublin Inst. for Advanced Studies, 1972, pp. 205ff.). See also other main discussions of the primordial causes, *De Div. Nat.* III, c. 1-17 (M. Uhlfelder and J. Potter, *John the Scot: Periphyseon—On the Division of Nature*, Indianapolis: Bobbs Merrill, 1976).
  16. *De Div. Nat.* II, c. 4-9. Thus material things exist more perfectly even in the mind of man, as spiritual, than in themselves.
  17. *De Div. Nat.* III, c. 1 (trans. Uhlfelder and Potter, p. 129): "The first causes themselves are, in themselves, one, simple, defined by no known order, and unseparated from one another. Their separation is what happens to them in their effects. In the monad, while all numbers subsist in their reason alone, no number is distinguished from another: for all are one and a simple one, and not a one compounded from many. . . . Similarly the primordial causes while they are understood as stationed in the Beginning of all things, viz., the only-begotten Word of God, are a simple and undivided one; but when they proceed into their effects, which are multiplied to infinity, they receive their numerous and ordered plurality, . . . all order in the highest Cause of all and in the first participation in it is one and simple distinguished by no differentiae; for there all orders are indistinguishable, since they are an inseparable one, from which the multiple order of all things descends."
  18. Thus in *Enneads* VI, 6, 9 in the order of Being in the *Nous* number is declared to be already *unfolded*, not as it is in the Monad or One. In V, 3, 15, all the ideas are unfolded as distinct in the *Nous*, which thus becomes a one-many, whereas the One should not be said to contain all things as in an indistinct total. See the other texts in note 5. Thus what Eriugena describes as the mode of the primordial causes in the Word is explicitly denied by Plotinus of the divine *Nous* and could be applied only to the One, in which the ideas could in no way be said to be present.
  19. *De Div. Nat.* II, c. 20 (ed. Sheldon-Williams, p. 77).
  20. *Ibid.*, II, 8 (ed. Sheldon-Williams, p. 29). For this identity of the being of things with the thought of them, see Bett, *op. cit.*, in n. 14, pp. 51, 145; Gregory, *op. cit.*, in n. 14, p. 12: "Gli essere nella mente di Dio si risolvono nell'atto con cui elgi li conosce."
  21. Cf. E. Gilson, *History of Christian Philosophy in the Middle Ages* (New York: Random House, 1954), ch. III: "Platonism in the Twelfth Century"; N. Häring, *Life and Works of Clarembald of Arras* (Toronto: Pontifical Institute of Medieval Studies, 1965).
  22. Clarembald of Arras, *Tractatus super Librum Boetii De Trinitate* (ed. Häring, *op. cit.*, in n. 21), II, 41, p. 123.
  23. *Ibid.*, II, 29-30, p. 118: "Forma sine materia est ens a se, actus sine possibilitate, necessitas, aeternitas. . . et ipsa Deus est."
  24. Thierry of Chartres' commentary on Boethius' *De Trinitate*, called *Librum Hunc* (ed. W. Jansen, *Der Kommentar des Clarembaldus von Arras zu Boethius De Trinitate*, Breslau, 1926, p. 18): "Omnium formae in mente divina consideratae una quodammodo forma sunt, in formae divinae simplicitatem inexplicabili quodam modo relapsae."
  25. See note 21.
  26. *Tract. super Lib. Boet. De Trin.* I, 34 (Häring, p. 99): "Omnis multitudo in simplicitate unitatis

- complicata latitat, et cum in serie numerandi post unum alterum et post alterum tertium numeratur, et deinceps tunc demum certa pluralitatis ab unitate profluentis forma cognoscitur, sicque sine alteritate nulla potest esse pluralitas."
27. *De Scientia Christi*, q. 2, c. Responsio (*Obras de S. Buenaventura*, Bihl. de Autores Christianos, Madrid, 1957), p. 138. Cf. also q. 3.
  28. Cf. the standard treatments of the "Thomistic existentialism," introduced by St. Thomas: E. Gilson, *The Christian Philosophy of St. Thomas Aquinas* (New York: Random House, 1956), the famous chapter I on "Existence and Reality"; J. de Finance, *Etre et agir* (Rome: Gregorian University Press, 1960, 2nd ed.); and my own summaries: "What is Really Real?" in ed. J. Williams, *Progress in Philosophy* (Milwaukee: Bruce, 1955), pp. 61-90, and "What is Most and Least Relevant in the Metaphysics of St. Thomas Today?" *Internat. Phil. Quart.* 14 (1974), 411-434.
  29. For Thomas' treatments on the divine ideas, see *Sum. c. Gentis IV*, c. 13, no. 10; *Sum. Theol.* I, q. 15 entire; I, q. 44, a. 3; I, q. 18, a. 4: "Whether All Things are Life in God"; *De Veritate*, q. 3, q. 4, a. 6 and 8. The description of the divine ideas as "invented" by God is in *De Ver.*, q. 3, a. 2 ad 6 m; as *rationes quasi excogitatas* is in *De Potentia*, q. 1, a. 5, ad 11 m.
  30. For Thomas' fundamental criticism of the Platonic realism of ideas, see *In I Metaph.*, lectio 10; *In I De Anima*, lect. 4, and the general discussion with texts in R. Henle, *St. Thomas and Platonism* (The Hague: Nijhoff, 1956), part II, ch. 4: "Basic Principles of the *Via Platonica*."
  31. *De Trinitate VI*, c. 8.
  32. Cf., for example, the great Flemish mystic, Jan Ruusbroec. "According to the Flemish mystic, man's true essence (*wesen*) is his superessence (*overwesen*). Before its creation the soul is present to God as a pure image; this divine image remains its superessence after its actual creation." Louis Dupré, *Transcendent Selfhood* (New York: Seabury, 1976), p. 103-104.
  33. See the texts in note 29, in particular *Sum. Theol.* I, q. 18, a. 4; *De Ver.*, q. 4, a. 8; *Sum. c. Gentis IV*, c. 13, n. 10 (Pegis trans.), and the special article just on this point, *De Ver.*, q. 4, q. 6: "Whether Things are More Truly in the Word than in Themselves." *In I Sent.*, d. 36, q. 1, q. 3 ad 2 m (M837): four modes of *esse creaturae*.
- St. Thomas' point is that if one looks at the mode of being of the thing in itself and in an idea (God's or man's), the *mode of being* in an idea, especially the divine idea, is a *spiritual* mode, identical with the being of the mind thinking it, hence from this point of view higher than the material being of a thing in itself; but if one considers the *proper mode* of a thing's own being as this thing, this is found only in the thing's own material being and not in its idea. Properly speaking, a thing's own being is not found in its idea. Thus Thomas is able to preserve intact the traditional formulas about the existence of things in the Word as more perfect, but the meaning he gives to them is notably different from their original intention, where his distinctions were not yet made.
34. Henry of Ghent, *Quodlibeta IX*, 2, cited in the fine study by Jean Paulus, *Henri de Gand* (Paris: Vrin, 1938), p. 91, n. 1.
  35. *Summa*, 68, 5, 7-14, cited in Paulus, *loc. cit.*
  36. *Loc. cit.* Cf. the illuminating remarks on Henry and his place in the history of our problem by Anton Pegis, *art. cit.* in note 6 above, esp. pp. 172-176.
  37. *In I Sent.*, d. 35, q. 5; cited in Pegis, *art. cit.*, p. 170.
  38. Gabriel Biel, *In I Sent.*, d. 35, q. 5C (Tübingen, 1501); cited in Pegis, p. 159.
  39. *In I Sent.*, d. 17, q. 1, a. 3K; Pegis, p. 171.
  40. *Art. cit.* in note 6, pp. 168-172.
2. "Dico nihilominus quod, si in deo est aliquid, quod velis vocare esse, sibi competit per intelligere" (*LW V*, p. 45, lines 4-5). The translation is that of A. Maurer, *Master Eckhart, Parisian Questions and Prologues* (Toronto: Pontifical Institute of Mediaeval Studies, 1974), p. 48.
  3. E.g., R. Klibansky, *Magistri Eckhardi Opera Latina XIII* (Leipzig-Rome: Santa Sabina, 1936), p. xix.
  4. For an outline of some of these positions, see Imbach, p. 290, n. 42.
  5. E.g., *Predigt* (hereafter *Pr.*) 52 "Beati pauperes spiritu" (*DW II*, p. 492). I have examined this problem in greater detail in my paper "The God Beyond God: Theology and Mysticism in the Thought of Meister Eckhart" *The Journal of Religion* 61 (1981), pp. 1-19.
  6. See, e.g., D. T. Suzuki, *Mysticism Christian and Buddhist. The Eastern and Western Way* (New York: MacMillan, 1957), pp. 18-21. For a nuanced discussion of the implications of the breakthrough to the Godhead in Eckhart, see R. Schürmann, *Meister Eckhart Mystic and Philosopher* (Bloomington: University of Indiana Press, 1978), pp. 114-118, 156-165, and 213.
  7. E.g., V. Lossky, *Théologie négative et connaissance de Dieu chez Maître Eckhart* (Paris: Vrin, 1960), pp. 342-345 and 363-367; and J. Loeschen, "The God Who Becomes: Eckhart on Divine Relativity," *The Thomist* 35 (1971), pp. 417-419. The problem is also raised by M. de Gandillac, "La 'dialectique' du Maître Eckhart," *La mystique rhénane* (Colloque de Strasbourg, 1961; Paris: Presses universitaires, 1963), pp. 73-75.
  8. *In agro dominico*, art. 22: "Pater generat me suum filium et eundem filium. Quidquid Deus operatur, hoc est unum; propter hoc generat ipse me suum filium sine omni distinctione" (Denzinger, *Enchiridion Symbolorum*: #972, olim 522). The excerpt is based on a passage in *Pr.* 6 "Iusti vivent in aeternum" (*DW I*, pp. 109.7-110.1). Eckhart's teaching on this point is also condemned in articles 11, 12, 13, 20, and 21, as well as being implied in appended article 1 concerning the uncreated element in the soul.
  9. The *Defense* has been edited both by A. Daniels and G. Thérý. I make use of Thérý's edition here. "Edition critique des pièces relatives au procès d'Eckhart contenues dans le manuscrit 33b de la bibliothèque de Soest," *Archives d'histoire doctrinale et littéraire du moyen âge* 1 (1926), pp. 129-268. See, e.g., pp. 197-199, 241-244 for a rebuttal on the birth of the Word in the soul, pp. 188, 209-215, for one on the uncreated part of the soul.
  10. K. Kertz comes close to this in his article "Meister Eckhart's Teaching on the Birth of the Divine Word in the Soul," *Traditio* 15 (1959), pp. 327-363.
  11. *LW I*, pp. 131-132, 166-170, 181.
  12. E.g., *In Ex.* n. 15 (*LW II*, p. 21); *In Sup.* n. 20 (*LW II*, pp. 341-342); *In Io.* nn. 97 and 347 (*LW III*, pp. 83-84, and 321); and the *Defense* (ed. Thérý, p. 195).
  13. *In II Periherm.* lectio 2, #2-5, commenting on *Periherm.* 10 (19b20-25).
  14. *LW I*, p. 167, 2-8: "Cum igitur dico aliquid esse, aut unum, verum seu bonum praedico, et in praedicatione cadunt tamquam secundum adiacens praemissa quattuor et formaliter accipiuntur et substantive. Cum vero dico aliquid esse hoc, puta lapidem, et esse unum lapidem, verum lapidem aut bonum hoc, scilicet lapidem, praemissa quattuor accipiuntur ut tertium adiacens propositionis nec sunt praedicata, sed copula vel adiacens praedicati" (trans. Maurer, p. 94).
  15. *LW I*, pp. 169, 6; 172, 6-9; 175, 12-176, 2.
  16. *LW I*, p. 132, 4-5: "quod solus deus proprie est et dicitur ens, unum, verum et bonum" (trans. Maurer, p. 79). See also *LW I*, pp. 167, 9-10; and 181, 15.
  17. "... quaedam copula" (*LW I*, p. 181, 14).
  18. E.g., *Prologus* n. 3 (*LW I*, pp. 166, 12-167, 2); *In Io.* n. 60 (*LW III*, pp. 49, 13-50, 1); *Collatio in Sent.* n. 3 (*LW V*, p. 20, 2). The importance of the distinction has been underlined by K. Albert, "Der philosophische Grundgedanke Meister Eckharts," *Tijdschrift voor Filosofie* 27 (1965), pp. 320-39.
  19. Almost all the major studies of Eckhart contain a treatment of his doctrine of analogy. In addition there are the valuable articles of M. de Gandillac, "La 'dialectique'," especially pp. 83-86; J. Koch, "Zur Analogielehre Meister Eckharts," *Mélanges offerts à Etienne Gilson* (Paris: Vrin, 1959), pp. 327-50; and F. Brunner, "L'analogie chez Maître Eckhart," *Freiburger Zeitschrift für Philosophie und Theologie* 16 (1969), pp. 333-49.
  20. *LW V*, p. 45, 1-2.
  21. *LW V*, p. 54, 1-2.

## MEISTER ECKHART ON GOD AS ABSOLUTE UNITY

1. *Meister Eckhart. Die deutschen und lateinischen Werke* (Stuttgart and Berlin: Kohlhammer, 1936ff.), hereafter abbreviated as *DW* and *LW*. The passage discussed may be found in *LW V*, pp. 37-48. The most complete study of this text is that of R. Imbach, *Deus est Intelligere* (Studia Friburgensia, N. F. 53, Freiburg, Sweiz, 1976). See also J. Caputo, "The Nothingness of the Intellect in Meister Eckhart's 'Parisian Questions,'" *The Thomist* 39 (1975), pp. 85-115.

22. *LW II*, pp. 280–83. Eckhart's starting point in Thomas Aquinas is *In I Sent.* d. 22, q. 1, a. 3, ad 2.
23. *LW II*, p. 282, 1–5: "... analogata nihil in se habent positive radicatum formae secundum quam analogantur. Sed omne ens creatum analogatur deo in esse, veritate et bonitate. Igitur omne ens creatum habet a deo et in deo, non in se ipso ente creato, esse, vivere, sapere positive et radicaliter."
24. The term is that of Brunner, *op. cit.*, p. 341–342.
25. *LW V*, pp. 37–48. For other examples of this denial, see *In Io.* nn. 5, 182–83 (*LW III*, pp. 7, 150–51).
26. *DW V*, pp. 8–61 *passim*, especially p. 30, 5–19. See also *Pr. 30* "Praedica Verbum" (*DW II*, pp. 93–109).
27. *History of Christian Philosophy in the Middle Ages* (New York: Random House, 1955), pp. 440–441.
28. "Zur Analogielehre," pp. 341–345. Brunner seems to agree when he detects traces of an analogy of intrinsic attribution (*op. cit.*, pp. 344–46).
29. See Lossky, *op. cit.*, pp. 315, 322–323, and 356–357 on this reversal. If I read him aright, the same is suggested by C. F. Kelley, *Meister Eckhart on Divine Knowledge* (New Haven: Yale University Press, 1977), p. 170.
30. See Koch, *op. cit.*, pp. 336–337, and Brunner, *op. cit.*, 347, for the contrast with analogy in Aquinas.
31. *Meister Eckhart on Divine Knowledge*, pp. 167–171.
32. *In agro dominico* art. 26 (D 976): "Omnes creaturae sunt unum purum nihil: non dico, quod sint quid modicum vel aliquid, sed quod sint unum purum nihil." The proposition is taken from *Pr. 4*, "Omne datum optimum" (*DW I*, pp. 69, 8–70, 1).
33. R. Schürmann, *op. cit.*, pp. 176–180, 185–192, has rightly emphasized the radical insufficiency of traditional notions of analogy to grasp the distinctive character of Eckhart's doctrine of God.
34. *LW II*, p. 482, 4–5: "Est igitur sciendum quod si unum idem est quod indistinctum. Omnia enim distincta sunt duo vel plura, indistincta vero omnia sunt unum."
35. Especially *LW I*, p. 172, 6–9. Slightly earlier in the *Prologus* Eckhart even seems to give priority to *unum* when he says: "Praeterea Boethius De Consolatione docet quod, sicut bonum et verum fundantur et finguntur per esse et in esse, sic et esse fundatur et figitur in uno et per unum" (p. 171, 3–5). On *unum* as the *nomen super omne nomen*, see *In Gen I*, n. 84 (*LW I*, p. 64, 7–10).
36. *LW II*, pp. 482, 10–483, 1: "Dicens ergo deum esse unum vult dicere deum esse indistinctum ab omnibus, quod est proprietas summi esse et primi et eius bonitas exuberans."
37. These are found in *LW II*, pp. 484, 1–485, 2.
38. *LW II*, p. 485, 5–7: "Sciendum igitur ad praesens quod si unum primo est voce quidem negativum, sed res ipsa affirmativum. Item est negatio negationis, quae est purissima affirmatio et plenitudo termini affirmati." The two poles identified here are similar to the two functions of unity discussed by Lossky, *op. cit.*, p. 68–72: *l'identité exclusive* or *puritas* (my second pole), and *l'identité inclusive* or *plenitudo* (my first pole).
39. *LW II*, p. 486, 3–5: "Propter quod immediatissime se tenet ad esse, quin immo significat puritatem et medullam sive apicem ipsius esse, quam nec si esse significat."
40. Macrobius, *Comm. in Somn. Scip.* I, 6, 7; Boethius, *De Trin.* 2; Proclus, *Elementatio theologica*, prop. 1.
41. *LW II*, p. 489, 7–8: "Iuxta quod notandum quod nihil tam distinctum a numero et numerato sive numerabili, creato scilicet, sicut deus, et nihil tam indistinctum." For what follows, see also the excellent discussion in Lossky, *op. cit.*, pp. 261–263.
42. *LW II*, p. 490, 4–7: "omne quod indistinctione distinguitur, quanto est indistinctius, tanto est distinctius: distinguitur enim ipsa indistinctione. Et e converso, quanto distinctius, tanto indistinctius, quia distinctione sua distinguitur ab indistincto. Igitur quanto distinctius, tanto indistinctius: et quanto indistinctius, tanto distinctius, ut prius." Eckhart concludes by citing the authority of Aquinas and John Damascene.
43. I wish to thank Richard Kieckhefer and his seminar group for helpful suggestions regarding these paraphrases.
44. *LW II*, p. 491, 7–10: "nihil tam indistinctum ab aliquo quam ab illo, a quo distinctione ipsa

- indistinguitur. Sed omne numerosum sive creatum sua distinctione indistinguitur a deo, ut dictum est supra. Ergo nihil tam indistinctum et per consequens unum. Indistinctum enim et unum idem. Quare deus et creatum quodlibet indistincta." The minor of the syllogism depends on the doctrine of *esse* advanced in n. 145 (p. 483, 4–7). This was the side of Eckhart's doctrine of God as Absolute Unity (taken in isolation, something which would have been anathema to the Meister) that was condemned in the Bull *In agro dominico* art. 10 (D960). The other two articles that attack his denial of distinction in God (arts. 23, 24) seem to be directed against the implications of the doctrine for faith in the Trinity.
45. Cited at *LW II*, p. 492, 3: "quanto quid est simplicius et unitius, tanto est potentius et virtuosius, plura potens."
46. This is logically distinct from the notion of identity that in its positive form lacks the dialectical character of *indistinctum*. *Sermo XXIX* n. 303 (*LW IV*, p. 269, 11–13) views *identitas* as one of the *consequentiae* of *unitas*.
47. The following list of examples is not exhaustive: *In Ex.* nn. 59–60, 102, 104, 107, and 117 (*LW II*, pp. 65–66, 104, 106, 107 and 112); *In Sap.* n. 52 (*LW II*, p. 379); *In Io.* nn. 99, 197, and 562 (*LW III*, pp. 85, 166, 489); *Sermones II* n. 7, X n. 105, XXIX n. 298, and XLIV, I n. 438 (*LW IV*, pp. 9, 100, 265, 368); and *Prolog.* n. 10 (*LW I*, p. 155).
48. See the note in *DW I*, pp. 361–362. Cf. B. Schmoltdt, *Die deutsche Begriffssprache Meister Eckharts* (Heidelberg: Quelle, 1954), p. 37.
49. *Quod.* X, q. 1, a. 1, ad 3; and *In I Sent.* d. 24, q. 1, a. 3, ad 1.
50. *Procli Commentarium in Parmenidem*, eds. R. Klibansky and C. Labowsky in *Plato Latinus*, vol. III (London: Warburg Institute, 1953). On the question of the *negatio negationis* in Proclus and its possible influence on Eckhart, see W. Beierwaltes, *Proklos. Grundzüge seiner Metaphysik* (Frankfurt: Klostermann, 1965), pp. 361–366, 395–398.
51. *In Ex.* nn. 110–117 (*LW II*, pp. 109–117) centers on the analysis of three axioms: (a) "nihil tam dissimile quam creator et creatura quaelibet," (b) "nihil tam simile quam creator et creatura quaelibet," and (c) "nihil tam dissimile pariter et simile alteri cuiquam, quam deus et creatura quaelibet sunt et dissimilia et similia pariter" (p. 110, 3–6). The dialectical parallel of this text to that in the *Wisdom* commentary comes out most strongly on p. 112, 7–15. See the discussion of this text in Lossky, *op. cit.*, pp. 265–274.
52. E.g., *In Sap.* nn. 38–39 (*LW II*, pp. 359–360), stressing opposition more than dialectic; *In Io.* nn. 99, 103, 151, 206–208 (*LW III*, pp. 85, 88, 125, 174–176); *Sermones VI*, I n. 53, X n. 103, XXXIV, 2 n. 344, XXXVII n. 375, and XLIV, I n. 438 (*LW IV*, pp. 52, 98, 299, 320–321, 367–368).
53. *Sermo IV*, I n. 28 (*LW IV*, p. 28, 5–9): "quia sicut deus est in se indistinctissimus secundum naturam ipsius, utpote vere unus et propriissime et ab aliis distinctissimus, sic et homo in deo indistinctus ab omnibus, quae in deo sunt—nam in ipso sunt omnia—et simul distinctissimus ab omnibus aliis."
54. *Pr. 52* "Beati pauperes" (*DW II*, p. 502, 5–9). The translation is that of R. Schürmann, *op. cit.*, pp. 218–219.
55. See K. Albert, *Meister Eckharts These vom Sein* (Saarbrücken: Universitäts- und Schulbuchverlag, 1976).
56. *In Io.* n. 360 (*LW III*, pp. 304–306).
57. *In Io.* nn. 511–513 (*LW III*, pp. 442–445). The same position can be found in nn. 516–518, and throughout the commentary on John 14:8 in nn. 546–565 (*LW III*, pp. 446–448, 477–493). See especially n. 562 (pp. 489–490).
58. This is clear from the discussion of *unum* in n. 513 (p. 444, 1–5). Here Eckhart approves the appropriation of *unum* or *unitas* to the Father, whereas in n. 360 he had distinguished between the *unitas* that signifies origin and is therefore proper to the Father and the hidden *li unum* which is proper to the divine ground and does not bear this positive connotation (p. 305, 9–306, 2).
59. *In Io.* n. 562 (*LW III*, p. 489, 3–10): "ratio enim entis est quid abiectum et indistinctum et ipsa sua indistinctione ab aliis distinguitur. Quo etiam modo deus sua indistinctione ab aliis distinctis quibuslibet distinguitur. Hinc est quod ipsa essentia sive esse in divinis ingentum est et non gignens. Ipsum vero unum ex sui proprietate distinctionem indicat. Est enim unum in se indistinct-

- tum, distinctum ab aliis et propter hoc personale est et ad suppositum pertinet cuius est agere. Propter quod sancti unum sive unitatem in divinis attribuant primo supposito sive personae, patri scilicet."
60. Even presumably late texts maintain the priority of *intelligere* over *esse* in God when *esse* is conceived of as God's first external work innermost to all things, e.g., *In Io.* n. 34 (*LW* III, pp. 27–28).
61. *Sermo* XXIX n. 300 (*LW* IV, pp. 266–267).
62. See n. 301 (*LW* IV, p. 267, 10).
63. N. 304 (pp. 269, 15–270, 3): "Intellectus enim proprie dei est, deus autem unus. Igitur quantum habet unumquodque de intellectu sive de intellectuali, tantum habet dei et tantum de uno et tantum de esse unum cum deo. Deus enim unus est intellectus, et intellectus est deus unus." On this Sermon, see Lossky, *op. cit.*, pp. 165–173, Imbach, *op. cit.*, pp. 173–174.
64. *Théologie négative*, especially pp. 60–64, 86–96, 200–207, 218, and 254–276. See the treatment of God as *unum* in Imbach, *op. cit.*, pp. 188–194.
65. *Art. cit.*, especially pp. 87–94.
66. E.g., H. Hof, *Scintilla animae* (Lund: Gleerup, 1952), pp. 105–112, 152–158, who has Hegel in mind; and J. Loesch, *art. cit.*, pp. 416 and 422, who never gives the reader any hint of what he understands by dialectic. For an introduction to the variety of ways in which dialectic has been understood in the history of philosophy, see R. Hall, "Dialectic," *Encyclopedia of Philosophy* vol. II (New York: MacMillan, 1967), pp. 385–389.
67. *Hegel's Dialectic, Five Hermeneutical Studies* (New Haven, Conn.: Yale University Press, 1976), pp. 20–22.
68. Gadamer argues for the latter on pp. 22–27.
69. *From Iamblichus to Eriugena* (Leiden: Brill, 1978), pp. 153–167, 283–288. In terms of the exegetical background to this shift, Gersh (pp. 11, 155, and 166, note 181) follows E. Corsini in seeing it as involving the application of both the First Hypothesis (negative) and the Second Hypothesis (positive) of the *Parmenides* to the Christian God.
70. E.g., *Enneads* V, 5, 1, V, 5, 9, and VI, 4–5. On this dialectic of immanence and transcendence in Plotinus, see R. Arnou, *Le désir de Dieu dans la philosophie de Plotin* (Rome: Gregorian University Press, 1967), pp. 148–185; and E. Bréhier, *The Philosophy of Plotinus* (Chicago: University of Chicago Press, 1958), p. 159.
71. Indicative of this new dimension in Christian thought are the differences that W. Beierwaltes discerns between the Proclean and the Eckhartian understandings of the *negatio negationis*, especially concerning the positive and personalistic dimensions in Eckhart (*Proklos*, pp. 395–398).
72. *Dialogus de substantiis separatis physicis* (Strasbourg: Grataroli, 1567, reprint: Frankfurt: Minerva, 1967, p. 306).
73. Especially in #209, 213–215.
74. This has recently been pointed out by B. Gerrish, *Tradition in the Modern World, Reformed Theology in the Nineteenth Century* (Chicago: University of Chicago Press, 1978), pp. 46–47. "Codetermination" is Gerrish's term, not Schleiermacher's.
75. "Dialektik und Analogie des Seins," *Scholastik* 26 (1951), pp. 57–86.
76. *Art. cit.*, p. 82.
77. *Art. cit.*, pp. 83–86.
78. Lossky discusses Coreth in *op. cit.*, pp. 260–261, note 42; and p. 322, note 313.
79. *Théologie négative*, p. 275.

#### NEOPLATONISM AND CHRISTIAN THOUGHT IN THE FIFTEENTH CENTURY (NICHOLAS OF CUSA AND MARSILIO FICINO)

1. Nikolaus von Cues und die griechische Sprache (Heidelberg, 1938).
2. The Letter to Paul II is quoted in the partial critical edition in Honecker, *op. cit.*, 70–73.
